MOULINS, moo'lân', France, capital city of the department of Allier, on the right bank of a river of the same name, which is spanned here by a beautiful bridge, built in 1763. It is the junction of the Lyons and Orleans railways, and contains the old Gothic cathedral built in 1465-1507 and finished by Viollet-le-Duc in 1861, and holding a triptych by Ghirlandajo among other art treasures. Here also are an ancient monastery church with monument of the executed (1632) Duke Henry II of Montmorency, a modern Gothic Sacred Heart (Jesus) Church, the 15th century clock-tower, ruins of the 14th century castle of the dukes of Bourbon, a palace of justice, town-hall, etc. Its industries include factories for woollens, tools, agricultural instruments, paper, bells, hats, oil and vinegar. It is the seat of a bishop and has a court of assizes, a chamber of commerce and two lycées, besides a seminary, two divinity colleges and museums of natural history, art and antiquities. There are also a large library and theatre. Pop. about 20,000.

MOULTON, mōl'tôn, **Ellen Louise Chandler**, American poet: b. Pomfret, Conn., 10 April 1835; d. 10 Aug. 1908. She was married to William U. Moulton, a Boston publisher, in 1855 (d. 1898). She had a wide literary acquaintance both in this country and in Eng-

and where she spent a part of every year for many seasons. Her weekly receptions both in Boston and London were the resort of many literary and artistic persons. Her lyrics are extremely musical and as a sonneteer she ranks high.

MOULTON, Forest Ray, American astronomer: b. Le Roy, Michigan, April 29, 1872; d. Chicago, Illinois, Dec. 7, 1952. He was graduated in 1894 at Albion College, and took the degree of Ph.D. at the University of Chicago in 1899. He was appointed (1898) associate in astronomy of the University of Chicago, becoming (1900) an instructor, and (1903) assistant professor, associate professor of astronomy (1908) and professor (1912-1927). From 1937-1948, he was administrative secretary of the American Association for the Advancement of Science. Among his many books are *New Methods in Exterior Ballistics* (1926); *Astronomy* (1931); *Consider the Heavens* (1935); *Autobiography of Science* (with J. J. Schifferes, 1945).

MOULTON, Richard Green, Anglo-American educator: b. Preston, England, May 5, 1849; d. England, Aug. 15, 1924. He was graduated from the University of London in 1869 and at Cambridge University in 1874, after which he was associated with the university extension movement of various American and English universities. He was connected with the University of Chicago from its foundation in 1892 until 1919. After 1901 he was professor of literary theory and interpretation and head of the department of general literature. He published *Shakespeare as a Dramatic Thinker* (1907); *The Literary Study of the Bible* (1896); *A Short Introduction to the Literature of the Bible* (1901); *The Modern Reader's Bible* (1895-1907); *World Literature* (1911); *The Modern Study of Literature* (1915).

MOULTRIE, William, mōl'trī, American soldier: b. South Carolina, 1731; d. Charleston, S. C., Sept. 27, 1805. He early allied himself with the military forces of the colonies and in the war with the Cherokees in 1761 the confidence of his fellow citizens in his ability was shown by his selection as captain of the body of troops raised to defend the frontier against the Indians. At the outbreak of the American Revolution in 1775 he was appointed colonel of the 2d colonial regiment and he also served as member of the South Carolina provincial congress in that year. He was engaged in the seizure of the public arsenals and the construction of fortifications around Charleston, and in March 1776 was ordered to construct a fort on Sullivan's Island. This he made of the only material at hand, palmetto logs, and when General Lee made an inspection he expressed his disapproval of the work, considering it totally unfit for the purpose of defense and advised its abandonment. Moultrie, however, continued the work and when an attack was made by the British Fleet under Sir Peter Parker the rude fort successfully withstood all assaults and was subsequently named for its brave commander. He was promoted to the rank of brigadier general in recognition of his services and given command of the forces in South Carolina and Georgia. So complete had been the defeat of Parker, however, that Charleston was not again attacked until 1779 when the British availed themselves of the absence of a

large share of the Continental force and attacked the town. The return of General Lincoln saved the city, but in the spring of 1780 a third attack by land and sea compelled capitulation. Moultrie was held a prisoner for two years and though offered rank and money to enter the British Army remained loyal to the cause of the colonies. Release came in 1782, when he was exchanged for Burgoyne, and though promoted to the rank of major general it was too late for him again to engage in active service. He was elected governor of South Carolina in 1785 and in 1794, and published in 1802 *Memoirs of the Revolution*.

MOULTRIE, city, Georgia, and Colquitt County seat; altitude 340 feet; near the Ocklockonce River; 125 miles south of Macon; on the Atlanta, Birmingham and Coast, and Georgia and Florida railroads; has a municipal airport. Moultrie is a tobacco market and commercial center, in a section producing cotton, watermelons, and livestock.

Moultrie was incorporated in 1859 and named for Gen. William Moultrie (q.v.) of Revolutionary War fame. It has a city manager. Pop. (1940) 10,147; (1950) 11,639.

MOUND BIRDS. See MEGAPODES.

MOUND BUILDERS AND MOUNDS.

In the first half of the 19th century the words "Mound Builders" and mounds came into both scholastic and popular usage to refer to the great number of earth mounds discovered by European settlers in the eastern half of the United States and to their supposed builders. The term "mound" properly applies to intentional constructions, usually of earth, rarely of piled stones, erected according to a preconceived plan. Large accumulations of community refuse, also found in that region, are sometimes referred to as "mounds," but properly are called "kitchen middens."

The Indians of the opening frontier had lost much of their native culture by 1800 and had almost completely given up the practice of mound building, hence it was difficult for early students of antiquities to conceive how these disorganized societies could have provided the religious drive and supported the vast amount of nonproductive labor that must have gone into the construction of the larger earthworks. Authorities such as the Rev. Thaddeus M. Harris, Ephraim George Squier and Edwin Hamilton Davis, and Dr. Joseph Jones postulated that the mounds were constructed by an earlier race with a much higher culture which had been replaced by the more primitive Indians. Popular theories credited the Toltecs or the lost tribes of Israel.

After the Bureau of American Ethnology was established under the direction of the Smithsonian Institution, it undertook an extensive program of mound excavation, directed by Cyrus Thomas in the years 1882 to 1891, principally for the purpose of determining whether the ancestors of the historic Indians or some mysterious vanished race were the builders of the mounds. The conclusion that the structures had been made by the ancestors of the historic Indians was not accepted by all writers on the subject, and the disappearance of the more romantic theory from popular usage has been understandably slow.

The study of the archaeology of the Mississippi Valley has accelerated considerably since

1900, particularly since 1930, and numerous excavations have been made by state and national scientific organizations. Techniques of excavation, analyses of evidence, and interpretations have undergone a parallel development, and archaeologists are now able to estimate the dates of earthworks, relate them to other prehistoric cultural remains, determine their purpose, and trace developments and changes in these old cultural patterns down to the period when the various Indian tribes were first described by European explorers. Recent technical developments have provided the dendrochronological and radiocarbon methods of dating which assist greatly in assigning calendrical dates to the relative chronologies that have been developed from cultural evidence.

CLASSES OF MOUNDS

The majority of the thousands of mounds in eastern North America can be classed in one of two categories of contrasting function, form, and historical origin. These categories have been called "Burial Mounds" and "Temple Mounds." Other categories such as hill-top forts and effigy mounds, while spectacular, are not so important numerically and will be described more briefly.

BURIAL MOUNDS

Origin.—Dome-shaped or conical mounds of earth, more rarely of stone, constructed to cover central burial chambers made of logs or stone, have a general distribution in the northern hemisphere and it appears very likely that the variations of this custom are historically connected. The Egyptian pyramids, developed from earlier tomb types about 2700 B.C., and earth mounds with central stone vaults were built for the heroes of Homeric times on the European mainland. At the close of the Neolithic and in the early Bronze Age (about 2000 B.C.), the custom of burying the dead in stone chambers covered with earth mounds spread from Spain through England and western France into southern Scandinavia. In England such mounds are called "barrows." Similar burial tumuli, termed "Kurgans," were made in central Siberia in the period of the widespread Afansiev and later Andronovo Cultures of the late Neolithic, about 1700–1400 B.C. Burial mounds spread into northern China, and became a prominent mode of burial in the Choo Dynasty, about 1000 B.C.

In both the Old and New Worlds the complex of cultural traits centering around mound building shares the traits of: 1, preserving the remains of the dead—in Asia, by mummification or extracting the viscera and drying; in America, usually by drying or stripping the flesh from the bones; and 2, constructing one or more vaults for the remains at ground level or below the surface, then covering these over with conical or dome-shaped heaps of earth.

North America.—When writers have used the term "Mound Builders," they have usually had in mind first the mounds and complicated earthworks of southern Ohio, sites like the Seip Mound, Turner, the Newark earthworks, or the Hopewell Site. These sites are now assigned to the Hopewell Culture, and Carbon¹⁴ time measurements indicate that the culture existed about the time of Christ. Surface remains at Hopewell sites consist of earth embankments forming geometrical figures such as squares, circles, octagons, each covering 20 to 50 acres. Several

geometrical figures may occur at one site, and sometimes they are connected by extensive parallel earth ridges forming "roadways." Conical burial mounds either accompany these earthworks or occur in isolation. They range from small structures eight feet high and 100 feet in diameter to large mounds 40 feet high. The burials, usually found within log vaults, are accompanied by ornaments made of copper, pearls, bear teeth or mica; pipes carved in the form of animals sitting on platforms; pottery; and tools and weapons of polished and chipped stone.

The Adena Culture of northern Kentucky and the adjacent portion of West Virginia is related to Hopewell. The burial mounds built by the peoples of that culture were frequently large, and the Grave Creek Mound in West Virginia (70 feet high and 300 feet in diameter) is probably the largest of this type ever built in North America.

The Hopewell Culture in a somewhat simplified form is widely distributed through the Mississippi Valley. It is found in western New York State where the mounds are small. Burial mounds of this culture have been investigated in Illinois, in western Michigan and southern Wisconsin. Related remains are found extending up the valley of the Missouri River as far as Kansas City. Through Missouri the mounds tend to be small and the central burial vaults are usually made of stone. Along the Mississippi River, Hopewellian mounds were frequently placed on the edge of the bluffs that border the flood plain.

In the valley of the Tennessee River in northern Alabama, the related culture is known as "Copena." This is characterized by conical mounds of moderate size. Some contain central grave pits lined with colored clay and covered with logs and bark.

In the lower part of the Mississippi Valley the Hopewellian variant is named "Marksville." There the material culture is very similar to Hopewell but is somewhat simpler, and the variety of items made and buried with the dead is not so great. Typical sites range from single conical burial mounds to as many as eight or ten scattered about without any plan of arrangement. The largest of the southern mounds are about 100 feet in diameter at the base and 20 feet high. At several locations, such as at Marksville, Louisiana, and the Spanish Fort Site in Yazoo County in Mississippi, there is a C-shaped earth wall enclosing 10 to 20 acres placed so that the two ends touch a river. These are obviously defensive works in contrast to the apparently ceremonial geometrical earthworks of Ohio. The southern burial mounds contain central log-covered tombs or simply central deposits of bones of the dead. As many as 1,100 skeletons have been recovered from one of these deposits.

About the peripheries of its distribution the custom of building burial mounds, variations on the basic Hopewellian plan, tended to last into later times. Thus it is associated with the Weeden Island Culture of northwest Florida (700–1200 A.D.), and remnants of the custom survive until the beginning of history, about 1700 A.D. for example among the Choctaw of Mississippi. Along the Atlantic Coast and near the Great Lakes the late use of ossuaries, or large burial pits, may be a retention of the central burial vault of the Hopewellian mounds, but there no earth was heaped above the grave.

TEMPLE MOUNDS

The second numerically important category of mounds is rectangular, truncated earth pyramids, constructed to serve as bases for wooden ceremonial buildings—temples and dwellings for important politico-religious leaders. Temple mounds are generally found arranged about courts one to two hundred yards in diameter, and the larger and more important tend to be at the western and eastern sides of these courts. Earth ramps with log-faced stairways frequently provided a more accessible approach to the tops of the mounds on the side toward the court. Excavations of these structures have shown that they normally contain a number of superimposed building levels. The ceremonial buildings had been intentionally destroyed at intervals, and before they were replaced a thick capping of earth was added to the entire mound surface. This renewing of the mound was an important part of the Temple Mound complex wherever it is found. Burials were occasionally made in these structures but as a secondary use and not as a primary function.

Origin of Temple Mounds.—Rectangular, flat-topped mounds of similar form, function, and construction are found in the Americas from the central part of Peru to the vicinity of the Great Lakes. The earliest temple mounds in Peru were modest earth structures that seem to date about 700-800 B.C., and from them there developed later large mud-brick pyramids which reached a height of 110 feet. In Middle America the earliest dated pyramidal structures are of about the same time. Stone rubble fill and masonry ramps are characteristic. The largest of these, the Pyramid of the Sun at Teotihuacan in Mexico, measures 700 feet on a side at the base and is over 200 feet high.

At the moment there is some question as to the possibility of this temple mound-building complex having been transmitted across the Pacific to Middle America from southern Asia where a similar custom is widely distributed. A number of other cultural traits are involved in the arguments, and the question of prehistoric connections between regions is far from settled.

Temple Mounds in the Mississippi Valley.

The relatively modest earth temple mounds of the eastern United States seem to have derived from Middle America, and first appear in the lower part of the Mississippi Valley in the Troyville cultural stage about 700-900 A.D., after the decline of the major burial mound-building cultures. The temple mound building complex became incorporated into the Mississippian Culture which was developing in the central part of the Mississippi Valley from approximately 900 to 1200 A.D. After 1200 A.D. Indians carrying variations of the Mississippian Culture spread out of the Valley in all directions and their cultural influence, including temple mounds arranged about plazas, is found over a large part of the East. By 1500 this complex had reached the Atlantic Coast in Georgia and South Carolina and was on the Gulf coast of Florida. Westward it diffused into eastern Texas and Nebraska. Northward temple-mound sites are found as far as the Aztalan Site in Wisconsin. To the northeast, it extends into Ohio and eastern Kentucky. Thousands of Mississippian mound groups are found in the region outlined.

The largest pyramidal mound in the Mississippi Valley is Monks Mound near East St.

Louis, Illinois. This measures 1,080 by 710 feet at the base and is 100 feet high. It was probably built about 1400-1600 A.D. and at least 60 smaller mounds, ranging up to 30 feet high are found in the bottom lands within a few miles from this largest mound of the Cahokia group. Other well known temple-mound groups are at Etowah, Georgia (highest mound, 61 feet), at Macon, Georgia (in Ocmulgee National Monument), at Moundsville, Alabama (Moundsville State Park), and the Winterville Site near Greenville, Mississippi. Some of these groups, particularly those that date late within the Mississippian Culture period (after c.1450 A.D.) are enclosed by defensive walls made of earth surmounted by a wooden palisade. This is found at such sites as Aztalan, mentioned above, at the Angel Site in southern Indiana, and at the Lake George Site near Holly Bluff, Mississippi.

If the antiquarians of the last century had read more carefully the narratives of the expedition of Hernandez de Soto, who traversed the present states of Florida, Georgia, Alabama, Mississippi, and Arkansas in the years 1541-1543, the question of a lost mound builder race need not have arisen, for these describe temple mounds being used at what must have been very nearly the highest development of Mississippian culture. Between that date and the first effective exploration and settlement of the territory west of the Appalachians about 1700 A.D., there had been a major decimation of Indian populations and disruption of their culture. Only a few tribes, such as the Natchez, Cherokee, and Creeks, retained the use of temple mounds by the beginning of the 18th century.

FORTIFICATIONS AND EFFIGY MOUNDS

Besides the two classes of mounds outlined, there are less numerous constructions which were attributed to the "mound builders." Hill-top fortifications with earth and stone walls are found from Mississippi and Georgia to New York State. They range in date from Hopewellian to Mississippian times. The Fort Ancient Site in Ohio is a well-known structure of this type. It dates in the Hopewell period.

Small mounds constructed in the form of unidentified linear figures, birds, animals, or rarely humans are particularly common in Wisconsin. The people who constructed them also built burial mounds in which the dead were placed in subfloor pits. These constructions predate the Hopewell Culture in Wisconsin.

METHOD OF MOUND CONSTRUCTION

All mounds in North America were constructed by human labor, by people carrying basket or skin loads of soil on their shoulders. Due to differences in color, individual loads frequently can be identified in the process of excavation and these weigh from 40 to 50 pounds. Sometimes the impression of a carrying basket is found enclosing a load of soil.

I., and Collier, D., *Indians Before Columbus* (Chicago 1947).

JAMES A. FORD,

Assistant Curator of North American Archaeology, American Museum of Natural History.

MOUND CITY, city, Illinois, seat of Pulaski County, situated at an altitude of 300 feet, on the Ohio River, 6 miles north of Cairo. It has freight service via the Illinois Central and New York Central railroads. The surrounding area produces fruit, vegetables, and cotton, and the city has canneries, lumber mills, and machine shops. Shipyards used during the Civil War are still in operation. Near the city is the Mound City National Cemetery, containing the graves of more than 5,600 soldiers and sailors. Incorporated in 1857, Mound City is governed by a mayor and council. Pop. (1950) 2,167.

MOUND CITY GROUP NATIONAL MONUMENT, Ohio, situated on the Scioto River, 4 miles north of Chillicothe. Established in 1923, it contains pre-Columbian Indian burial mounds and covers an area of 57 acres.

MOUNDSVILLE, city, West Virginia, seat of Marshall County, situated at an altitude of 645 feet, on the Ohio River, 12 miles south of Wheeling. It is served by the Baltimore & Ohio Railroad and has a municipal airport. The city is the center of an agricultural and coal-producing region. Its industrial products include glassware, enamelware, cables, toys, brooms, clothing, and refined zinc. Moundsville is the seat of the state penitentiary. It has a city stadium, a public library, and a general hospital. In the center of the city is Grave Creek Mound from which Moundsville derives its name. Two small villages were merged and incorporated in 1865 to form the present city. Government is administered by a mayor and council, and the water supply system is municipally owned. Pop. (1950) 14,772.

MOUNET, mōō-nē', Jean Sully (called JEAN MOUNET-SULLY), French tragedian: b. Bergerac, Feb. 27, 1841; d. Paris, March 1, 1916. Because of family opposition, he was not able to enter the Paris Conservatoire until he became of age. In 1868 he received its first prize for tragedy and made a successful appearance at the Odéon. After serving as an officer in the Franco-Prussian War, he returned to the stage, appearing at the Comédie Française in 1872 and becoming a member of its company two years later. His chief successes were in the tragic roles of French classical drama. His most notable achievement was a production of *L'Oedipe roi* at the old Roman theater in Orange in 1888. With Pierre Barbier, he wrote *La Vieillesse de Don Juan* (1906).

His brother, JEAN PAUL MOUNET (1847-1922), was also an actor and taught at the Conservatoire. Among his roles were Hamlet, Othello, and Anthony.

MOUNT, William Sidney, American painter: b. Setauket, N. Y., Nov. 26, 1807; d. Stony Brook, N. Y., Nov. 19, 1868. In 1826-1827 he studied at the National Academy of Design, New York City, of which he became an associate member in 1832. He first aroused interest by his *Christ Raising the Daughter of Jairus* (1828) and by a number of portraits, including studies of Bishop Henry Onderdonk and Daniel Webster. He is best known, however, as one of the founders of American genre painting. Among his realistic studies of American life are *Bargaining for a Horse* (New York Historical

Society); *Raffling for the Goose* (Metropolitan Museum of Art, New York); *The Long Story* (Corcoran Gallery, Washington); and *Coming to the Point* (New York Public Library).

MOUNT AIRY, town, North Carolina, situated in Surry County, at an altitude of 1,015 feet, 35 miles northwest of Winston-Salem. There is freight service via the Southern Railway. The town has a large tobacco market and produces furniture, hosiery, clothing, and metal products. One of the largest open-faced granite quarries in the world is located here. First settled in 1860, Mount Airy was incorporated in 1885. It is governed by a mayor and commissioners and owns its water supply system. Pop. (1950) 7,192.

MOUNT ALLISON UNIVERSITY, Sackville, New Brunswick, Canada, a coeducational institution of higher learning affiliated with the United Church of Canada. Chartered in 1853 as Mount Allison Wesley College, it became a university in 1913. It has faculties of arts and science, schools of home economics and of fine and applied arts, and a conservatory of music. In the academic year 1951-1952 it had a faculty of 61 and a full-time student body of 608. The buildings, grounds, and equipment were valued at \$2,180,768, and the endowment totaled \$1,141,285. There were 67,805 volumes in the library.

MOUNT ATHOS (HAGION OROS), autonomous monastic district, Greece. See ATHOS.

MOUNT CARMEL, city, Illinois, seat of Wabash County, situated at an altitude of 390 feet, on the Wabash River, 24 miles south-southwest of Vincennes, Ind. It is served by the Southern and the New York Central railroads and has a municipal airport. The city's industrial products include roofing materials, electronic equipment, clothing, and flour, and it has railroad shops. Settled in 1817, Mount Carmel was incorporated as a village in 1824 and as a city in 1865. Government is of the commission type, and the water supply system is municipally owned. Pop. (1950) 8,732.

MOUNT CARMEL, borough, Pennsylvania, situated in Northumberland County, at an altitude of 1,055 feet, 15 miles west-northwest of Pottsville, on the Pennsylvania, the Reading, and the Lehigh Valley railroads. The borough is the trading center for the surrounding anthracite coal region. Its industrial products include clothing, chemicals, cigars, and beer. First settled in 1794, Mount Carmel was incorporated in 1864. Government is administered by a chief Burgess and council. Pop. (1950) 14,222.

MOUNT CLEMENS, city, Michigan, seat of Macomb County, situated at an altitude of 600 feet, on the Clinton River near its outlet into Lake St. Clair, and on the Grand Trunk Railway, 20 miles north-northeast of Detroit. The city's industrial products include pottery, cabin cruisers, trailers, automobile parts, farm implements, food products, electric ironers, and electric ranges. Mount Clemens is the seat of Selfridge Air Force Base.

Platted in 1818 by Christian Clemens, for whom it was named, Mount Clemens was incorporated as a village in 1837. For some years its

mainstay was the making of casks for the whalers of New Bedford, Mass. With the decline of whaling, development was at a standstill until 1868, when it was learned that water from local mineral springs had medicinal properties. Since then Mount Clemens has been a popular health resort. It was incorporated as a city in 1879. Government is of the commission type, and the water supply system is publicly owned. Pop. (1950) 17,027.

MOUNT DESERT, island, Maine, situated in Hancock County, off the southeast coast of the state, 40 miles southeast of Bangor. The largest island in Maine, it is about 14 miles long and 8 miles wide and has an area of approximately 100 square miles. It is separated from the mainland by Western Bay, Mount Desert Narrows (spanned by a bridge), and Frenchman Bay. The coastline is very irregular. It is indented on the north by Eastern Bay; on the south by Somes Sound, a fjord which extends for 6 miles into the center of the island; and on the west by Seal Cove and Western Bay. The surface is mountainous, rising to a height of 1,532 feet on Cadillac Mountain. There are several freshwater lakes in the interior. Acadia National Park, established in 1916 and covering 44.6 square miles, lies mainly on Mount Desert (it also includes Schoodic Peninsula on the mainland and part of Isle au Haut). There are five towns on the island: Mount Desert, incorporated in 1789; Bar Harbor, incorporated as Eden in 1796 and renamed in 1918; Cranberry Isles (1830); Tremont (1848); and Southwest Harbor, set off from Tremont in 1905.

The island was visited and named by Samuel de Champlain in 1604. A French colony was established on Somes Sound in 1613. In 1713 the island was ceded to Great Britain, and in 1762 the first permanent settlement was made. Since the late 19th century the island has been a popular summer resort. It was severely damaged by fire in 1947.

MOUNT DORA, town, Florida, situated in Lake County, at an altitude of 105 feet, on Lake Dora and the Atlantic Coast Line Railroad, 26 miles northwest of Orlando. The surrounding area raises citrus fruit, and the town has canneries, packing plants, and box factories. Mount Dora is a popular winter resort. Founded between 1880 and 1883, it was incorporated in 1910. Government is by mayor and council. Pop. (1950) 3,028.

MOUNT EPHRAIM, borough, New Jersey, situated in Camden County, at an altitude of 65 feet, 5 miles south of Camden. It has freight service via the Pennsylvania-Reading Seashore Lines. Settled in the 18th century, it was incorporated in 1926. Pop. (1950) 4,449.

MOUNT FOREST, town, Ontario, Canada, situated in Wellington County, on a branch of the Saugeen River and on the Canadian Pacific and Canadian National railroads, 38 miles northwest of Guelph. Its industrial establishments produce woolen textiles, clothing, agricultural machinery, baskets, and wood products. Pop. (1951) 2,291.

MOUNT HEALTHY, city, Ohio, situated in Hamilton County, 9 miles north of Cincinnati,

of which it is a residential and industrial suburb. It produces clothing, brick, flour, dairy products, and tools. Founded in 1817, it is governed by a mayor and council. Pop. (1950) 5,533.

MOUNT HOLLY, unincorporated village, New Jersey, seat of Burlington County, situated at an altitude of 40 feet, on Rancocas Creek and the Pennsylvania Railroad, 18 miles east of Camden. Its industrial establishments produce shoes, children's sweaters, hosiery, upholstery fabrics, and leather goods.

Mount Holly was founded by Quakers in the 17th century. The first settlers were Thomas Rudyard and John Ridges, who purchased the site in 1676. The Friends' Meetinghouse, which has been restored, was built in 1775. The state legislature met here in 1779, and for a brief period the village was the capital of New Jersey. It became the county seat in 1796, and the courthouse, still in use, was built that year. Mount Holly was the home of John Woolman (q.v.), who is commemorated in the John Woolman Memorial Building (1771). Pop. (1950) 8,206.

MOUNT HOLYOKE COLLEGE, a college for women at South Hadley, Mass., founded by Mary Lyon (q.v.). Chartered in 1836, it opened in 1837 as the Mount Holyoke Seminary. The curriculum was gradually enlarged and the entrance requirements raised until a full college course was given, and in 1888 the name was changed to Mount Holyoke Seminary and College. In 1893 the seminary course was dropped, and the present name was adopted. Entrance to the college is by examination and by certificate from approved schools. The degrees of B.A. and M.A. are conferred. The campus includes over 600 acres. The principal buildings are Mary Lyon Hall, which occupies the site of the original building destroyed by fire in 1896; the Dwight Memorial Art Building; Lydia Shattuck Hall, for the chemistry department; the Cornelia Clapp Laboratory, for other sciences; Skinner Recitation Hall; the observatory; the gymnasium; Mary E. Woolley Hall, which contains a large auditorium and offices for college organizations and publications and for the alumnae secretary; and the library, which contained approximately 223,500 volumes in 1952. In that year the endowment of the college amounted to \$7,422,038, and the buildings, grounds, and equipment were valued at \$8,031,701. Students totaled 1,262 in the academic year 1951-1952, and the faculty numbered 133.

MOUNT JOY, borough, Pennsylvania, situated in Lancaster County, at an altitude of 360 feet, on the Pennsylvania Railroad, 12 miles west-northwest of Lancaster. Its industrial establishments produce shoes, cotton and woolen textiles, iron castings, toys, hardware, boxes, and chocolate. The borough was incorporated in 1851. Pop. (1950) 3,006.

MOUNT KISCO, village, New York, situated in Westchester County, at an altitude of 290 feet, on the New York Central Railroad, 36 miles north-northeast of New York City, of which it is a residential suburb. The village also has factories producing furniture, wood products, and machinery. There is a summer theater. Mount Kisco was incorporated in 1874 and is governed by a mayor and council. The water

supply system is publicly owned. Pop. (1950) 5,907.

MOUNT MCKINLEY NATIONAL PARK, Alaska, situated in the Alaska Range, about 120 miles southwest of Fairbanks. It was established on Feb. 26, 1917. The park covers an area of 3,030.2 square miles and includes Mount McKinley (20,300 feet), the highest mountain in North America, and several other peaks. It is thickly wooded with white spruce, white birch, cottonwood, and willow trees. Among the wild animals found in the park are wolves, grizzly bears, white Alaska sheep, caribou, and moose. See also MCKINLEY, MOUNT.

MOUNT MARY COLLEGE, Milwaukee, Wis., a Roman Catholic college for women founded in 1872 in Prairie du Chien, Wis., as St. Mary's Institute. It became St. Mary's Academy in 1897 and St. Mary's College and Academy in 1913. The present name was adopted in 1929, when the college was moved to Milwaukee. The degrees of B.A., B.S., and Ph.D. are conferred. The college has a campus of 79 acres and a library with 41,628 volumes (1951). In the academic year 1951-1952 there were 47 full-time faculty members and 606 students.

MOUNT MERCY COLLEGE, Pittsburgh, Pa., a Roman Catholic college for women founded in 1929 and chartered in 1933. The degrees of B.A. and B.S. are conferred. The college has a campus of 13 acres and a library with 30,632 volumes (1952). In the academic year 1951-1952 there were 45 faculty members and 472 students.

MOUNT MORRIS, village, New York, situated in Livingston County, at an altitude of 595 feet, on the Genesee River, 34 miles south-southwest of Rochester. It is served by the Pennsylvania and the Delaware, Lackawanna and Western railroads, and has a municipal airport. The village's industrial establishments produce canned food, condiments, and electrical appliances. Pop. (1950) 3,450.

MOUNT OLIVE, town, North Carolina, situated in Wayne County, at an altitude of 155 feet, on the Atlantic Coast Line Railroad, 14 miles south-southwest of Goldsboro. The surrounding area produces tobacco, cotton, and vegetables, and the town has a large bean market, a pickle cannery, and crate and lumber mills. Mount Olive was founded in 1839-1840. Pop. (1950) 3,732.

MOUNT OLIVER, borough, Pennsylvania, situated in Allegheny County, within the southern part of Pittsburgh. Incorporated in 1892, it is governed by a mayor and council. Pop. (1950) 6,646.

MOUNT PENN, borough, Pennsylvania, situated in Berks County, just southeast of Reading, of which it is a residential suburb. It also has hosiery mills. Mount Penn was laid out in 1884 and incorporated in 1902. Pop. (1950) 3,635.

MOUNT PLEASANT, city, Iowa, seat of Henry County, situated at an altitude of 725 feet, on the Burlington Route, 27 miles west-

northwest of Burlington. The manufacture of pens is the city's leading industry. Mount Pleasant is the seat of Iowa Wesleyan College, a coeducational Methodist college founded in 1842; a county soldiers' and sailors' hospital; and a state hospital for the mentally ill. Incorporated in 1842, it is governed by a city manager. The water supply and electric lighting systems and an airport are municipally owned. Pop. (1950) 5,843.

MOUNT PLEASANT, city, Michigan, seat of Isabella County, situated at an altitude of 760 feet, on the Chippewa River and the Ann Arbor and the Chesapeake & Ohio railroads, 45 miles west of Bay City. In an area raising sugar beets, corn, beans, and other farm products, the city has a sugar refinery, a milk condensery, and flour mills. It also has factories making plumbing fixtures and automobile hardware, and it refines oil from nearby wells. Mount Pleasant is the seat of the Central Michigan College of Education (coeducational; 1892) and of a state home and school for feeble-minded children. Incorporated as a village in 1875 and as a city in 1889, it has commission government. The water supply system and an airport are municipally owned. Pop. (1950) 11,393.

MOUNT PLEASANT, borough, Pennsylvania, situated in Westmoreland County, at an altitude of 1,105 feet, 30 miles southeast of Pittsburgh. It is served by the Baltimore & Ohio and the Pennsylvania railroads and by All American Airways. The borough is the trading center of a farming and coal-mining area. Its industrial establishments produce coke, cement products, cigars, and metal goods. Mount Pleasant is governed by a mayor and council. Pop. (1950) 5,883.

MOUNT PLEASANT, town, Tennessee, situated in Maury County, at an altitude of 625 feet, on the Louisville & Nashville Railroad, 12 miles west-southwest of Columbia. The surrounding area has phosphate mines and raises tobacco, corn, and wheat. The town's industrial establishments produce chemicals, fertilizer, and clothing. Mount Pleasant has a municipal airport. Pop. (1950) 2,931.

MOUNT PLEASANT, city, Texas, seat of Titus County, situated at an altitude of 395 feet, 55 miles west-southwest of Texarkana. It is served by the St. Louis Southwestern and the Paris & Mt. Pleasant railroads and has a municipal airport. The surrounding area produces cotton, vegetables, corn, lumber, and oil, and the city has oil refineries, milk processing plants, woodworking establishments, and pottery factories. Incorporated in 1900, Mount Pleasant is governed by a city manager and owns its water supply. Pop. (1950) 6,342.

MOUNT PROSPECT, village, Illinois, situated in Cook County, at an altitude of 670 feet, on the Chicago and Northwestern Railway, 20 miles northwest of Chicago, of which it is a residential suburb. The village also has factories producing stapling machines and kitchen equipment. First settled in 1832, Mount Prospect was incorporated in 1917 and is governed by a village president and a board of trustees. Pop. (1950) 4,009.

MOUNT RAINIER, town, Maryland, situated in Prince Georges County, 4 miles northeast of Washington, D.C., of which it is a residential suburb. It is governed by a mayor and council. Pop. (1950) 10,989.

MOUNT RAINIER NATIONAL PARK. See RAINIER, MOUNT.

MOUNT REVELSTOKE NATIONAL PARK, British Columbia, Canada, situated on the west slope of the Selkirk Mountains, 18 miles northeast of Revelstoke. It was established in 1914. The park contains a game sanctuary and is a center of winter sports and summer camping. Its spectacular scenery and profusion of alpine flowers attract many visitors.

MOUNT ROYAL, town, Quebec, Canada, situated on Montreal Island immediately adjoining the cities of Outremont and Montreal, on the northwest side of the height Mount Royal. A tunnel cut through the mountain by the Canadian National Railway Company in 1918 gives the town nine-minute electric railway service to the center of Montreal. There is also freight service via the Canadian Pacific Railway. Mount Royal has industrial establishments producing electrical apparatus, radios, tobacco, and beverages, but it is primarily a residential town. Its streets are attractively landscaped, and many of its buildings are of a local limestone. The park system includes a civic recreation center. Pop. (1951) 1,352.

MOUNT RUSHMORE NATIONAL MEMORIAL. See RUSHMORE, MOUNT.

MOUNT SAINT JOSEPH-ON-THE-OHIO, College of, a Roman Catholic college for women in Mount St. Joseph, Ohio. It was chartered in 1854 and opened in 1907, becoming a four-year college in 1920. The degrees of B.A., B.S., and B.Mus. are conferred. The college has a campus of 30 acres, a 400-acre farm, and a library containing about 30,000 volumes (1952). In that year the grounds, buildings, and equipment were valued at \$1,279,726, and the endowment totaled \$1,725,000. There were 52 faculty members and 432 students in the 1951-1952 academic year.

MOUNT SAINT MARY'S COLLEGE, Los Angeles, Calif., a Roman Catholic college for women, chartered in 1925. The degrees of B.A., B.S., and B.Mus. are conferred. It has a 54-acre campus and a library containing 32,700 volumes (1952). In that year the buildings, equipment, and grounds were valued at \$1,000,000. In the 1951-1952 academic year there were 50 faculty members and 467 students.

MOUNT SAINT MARY'S COLLEGE, Emmitsburg, Md., a Roman Catholic college for men, founded in 1808 and chartered in 1832. The degrees of B.A. and B.S. are conferred. The campus covers 1,300 acres, and the library has 38,000 volumes (1952). In 1951-1952 the college had 25 faculty members and 588 students.

MOUNT SAINT SCHOLASTICA COLLEGE, Atchison, Kans., a Roman Catholic college for women founded as an academy in 1863. It became a junior college in 1924 and a senior college in 1930. The degrees of B.A., B.S., and

B.Mus. are conferred. The college has a 62-acre campus and a library containing 31,700 volumes (1952). In the 1951-1952 academic year there were 29 faculty members and 345 students.

MOUNT SAINT VINCENT, College of, New York, N. Y., a Roman Catholic college for women, founded in 1910 and chartered in 1911. The degrees of B.A. and B.S. are conferred. The college has a 96-acre campus and a library containing 25,542 volumes (1952). In that year the grounds, buildings, and equipment were valued at \$2,779,510. There were 46 faculty members and 446 students in the 1951-1952 academic year.

MOUNT STERLING, city, Kentucky, seat of Montgomery County, situated at an altitude of 940 feet, on the Chesapeake & Ohio Railroad, 16 miles east-northeast of Winchester. The surrounding area raises livestock, poultry, tobacco, and grain. The city's industrial establishments produce flour, gloves, cotton fabrics, candy, butter, crushed lime, and concrete and lumber products. Mount Sterling was laid out in 1793 and was first called Little Mountain Town. In December 1863 it was taken by Confederate troops. Government is by mayor and council. Pop. (1950) 5,294.

MOUNT UNION, borough, Pennsylvania, situated in Huntingdon County, at an altitude of 600 feet, on the Juniata River, 22 miles southwest of Lewistown. It is served by the Pennsylvania and the East Broad Top railroads and by All American Airways. The borough's industrial establishments produce clothing, bricks, concrete blocks, and creosote. Laid out in 1849, Mount Union was incorporated in 1867. Pop. (1950) 4,690.

MOUNT UNION COLLEGE, Alliance, Ohio, a coeducational college founded in 1846 by the Methodist Church. It was called the Select School until 1849, when it became Mount Union Seminary. In 1858 it was chartered and received its present name. Scio College, of Scio, Ohio, was united with it in 1911. The degrees of B.A., B.S., and B.Mus. are conferred. In the 1951-1952 academic year the college had 49 faculty members and 670 full-time students.

MOUNT VERNON, city, Illinois, seat of Jefferson County, situated at an altitude of 475 feet, 79 miles east-southeast of St. Louis, on the Southern, the Missouri Pacific, the Chicago & Eastern Illinois, and the Louisville & Nashville railroads. There is a municipal airport. The city is the trading center for an area producing oil and raising apples, peaches, and poultry. Its industrial establishments produce freight cars, shoes, stoves and furnaces, hosiery, electrical machinery, clothing, and food products. Mount Vernon has a public library, a general hospital, and a children's home. Settled in 1819 by colonists from Virginia and the Carolinas, it was incorporated in 1837 and chartered as a city in 1872. Government is by mayor and council. Pop. (1950) 15,600.

MOUNT VERNON, city, Indiana, seat of Posey County, situated at an altitude of 375 feet, on the Ohio River near the mouth of the Wabash, 20 miles west-southwest of Evansville. It is

served by the Chicago & Eastern Illinois and the Louisville & Nashville railroads and has a municipal airport. The surrounding area produces oil and raises corn, wheat, hay, and vegetables. The city has machine shops, oil refineries, factories producing handles and farm and mine equipment, and food-processing plants. Settled in 1816, Mount Vernon was incorporated in 1865. Government is by mayor and council. Pop. (1950) 6,150.

MOUNT VERNON, city, New York, situated in Westchester County, at an altitude of 115 feet, on the Bronx and Hutchinson rivers, adjacent to New York City on the northeast. It is served by the New York Central and the New York, New Haven and Hartford railroads. Though primarily a residential suburb of New York City, Mount Vernon has considerable trade and a number of industries. Its chief manufactures are clothing, chemicals, electrical and office equipment, oil burners, weather stripping and metal screens, radio and X-ray equipment, truck bodies, bricks, optical lenses, and air-conditioning equipment. The city's educational and recreational facilities include two senior and four junior high schools, a public library, and several parks, playgrounds, and recreation centers.

In 1642, Anne Hutchinson (q.v.) settled on the site of what later became Eastchester, now part of Mount Vernon. Here in 1643 her house was burned, and she and all her household except her youngest daughter were massacred by the Indians. In 1664, 10 families were transplanted to the site from Fairfield, Conn., by Thomas Pell (who established Pelham Manor), and the village of Eastchester sprang up. Out of the celebrated election held here in 1733, at which Lewis Morris (q.v.) was chosen to represent the town of Eastchester in the Assembly, against the opposition of Governor William Cosby, by whom he had been deposed as chief justice of the province, grew the founding of the *New York Weekly Journal* and the trial of John Peter Zenger (q.v.), by which the principle of the freedom of the press was first established in America. St. Paul's Parish was founded in 1665, and the present St. Paul's Church, made a national historic site in 1943, was begun about 1761, though not completed until 1788. The city of Mount Vernon is largely the outgrowth of a planned community launched here in 1850 by the Home Industrial Association, which had been formed that year by persons of moderate means, then residing in New York City, who sought to escape the high realty values of the metropolis through a program of cooperative home building in this less populous area. It was chartered in 1892. Government is by mayor and council. Pop. (1950) 71,899.

MOUNT VERNON, city, Ohio, seat of Knox County, situated at an altitude of 990 feet, on the Kokosing River and the Pennsylvania and the Baltimore & Ohio railroads, 27 miles south of Mansfield. Its industrial establishments produce cellophane, plate glass, milk bottles, bits for rock drills, fabricated steel, and steam, diesel, and gas engines. Here Daniel Decatur Emmett (q.v.), author of *Dixie*, was born. John Chapman (Johnny Appleseed), in a deed for three lots in Mount Vernon sold in 1828, described himself as "by occupation a gatherer and planter of apple seeds." Mount Vernon was incorporated

in 1805. Government is by mayor and council. Pop. (1950) 12,185.

MOUNT VERNON, city, Washington, seat of Skagit County, situated at an altitude of 25 feet, on the Skagit River, 27 miles south-south-east of Bellingham. It is served by the Great Northern Railway and West Coast Airlines. The surrounding area raises peas, poultry, and dairy cattle, and the city has canneries, food-processing plants, and woodworking establishments. Mount Vernon Junior College was established in 1926. Government is by mayor and council. Pop. (1950) 5,230.

MOUNT VERNON, home and burial place of George Washington, Fairfax County, Va., situated on the south bank of the Potomac River and on the Mount Vernon Memorial Highway about 15 miles below Washington, D.C. The original name of the estate was Little Hunting Plantation, and it contained about 5,000 acres. When the portion known as Hunting Creek came into the possession of Lawrence Washington, half brother of George, in 1743, he changed the name to Mount Vernon, in honor of Admiral Edward Vernon of the British Navy. The main part of the house was built by Lawrence, and a third story and wings were added by George, who inherited the estate two years after Lawrence's death in 1752. After Washington's death in 1799, the house and estate passed to his nephew, Bushrod Washington. The last private owner, John A. Washington, Jr., sold the house and 200 acres of land around it to the Mount Vernon Ladies' Association, which was organized in 1856 and took possession in 1860. Since then the association has restored the house as nearly as possible to its condition during the lifetime of George Washington.

The house stands on a bluff 200 feet above the Potomac. Of wood, painted white, it is three stories high, 96 feet long, and 30 feet deep. A high piazza extends along the front, and the six rooms on the ground floor contain many objects of historical interest connected with the life and times of Washington. In the garden are a number of trees which he planted, and in the coach house is his carriage. Near a wood ravine a short distance from the house is a tomb, a plain brick structure erected between 1831 and 1837, containing the sarcophagi of the president and his wife, Martha.

MOUNTAIN ASH, urban district, Wales, situated in Glamorganshire, on a tributary of the Taff River, 5 miles south of Merthyr Tydfil. The principal industry is coal mining. A musical festival is held annually in the Eisteddfod Hall here. Pop. (1951) 31,528.

MOUNTAIN ASH, the popular name of any of a number of trees or shrubs of the genus *Sorbus*. The European mountain ash or rowan tree (*S. aucuparia*), which grows to a height of 50 feet, has ashlike, pinnate leaves and small, yellowish white flowers, followed by globose, orange-red pomes. Its hard, compact wood is used by cabinetmakers. It is often planted for ornament in the United States. Closely resembling it is the principal North American species, *S. americana*, which grows to a height of 30 feet and ranges from Newfoundland to North Carolina. Another American species, *S. scopulina*, has larger fruit.

and its leaves are more like those of the elder. Both American species are often found as shrubs.

MOUNTAIN BEAVER. See SEWELLE.

MOUNTAIN BROOK, city, Alabama, situated in Jefferson County, adjacent to the south side of Birmingham, in the north central portion of the state. Incorporated as a city in 1942, Mountain Brook is a residential community, served by two United States highways and a branch of the Louisville & Nashville Railroad. Pop. (1950) 8,359.

MOUNTAIN CLIMBING, a highly active sport, now practiced in all parts of the world. It varies from making gentle ascents on easy terrain to scaling seemingly impossible crags, needles, faces, and peaks, where specialized equipment and techniques are called into play. Even where the mountain itself is comparatively easy, high altitudes, severe climatic conditions, and physical fatigue may complicate the ascent. Experience and judgment are needed to evaluate properly objective dangers, such as rocks falling across otherwise easy routes, avalanches, sudden changes of weather, and lightning.

Equipment.—For all climbing involving technical difficulty, the climber must be shod in special boots. Leather boots with deeply cleated rubber soles have generally replaced the heavily nailed boot used before World War II, as well as, in many cases, the lighter felt or rope-soled *Kletterschuh*, or rock-climbing shoe. A 120-foot nylon rope, $\frac{3}{16}$ inch in diameter, is the other essential piece of equipment for climbing of any difficulty at all. Although the rope is occasionally used as a direct climbing aid, its normal function is as a safeguard to the two or three climbers who rope themselves together; if one slips, the others, with the rope well belayed, prevent his falling any great distance. Since the leader on the ascent, or the last man down on the descent, has no rope from above to safeguard him, he may fall double the distance between him and the next man; the best climber, therefore, is always placed in that position.

Rock Climbing.—In rock climbing of any real difficulty the leader climbs upward, grasping handholds mainly for balance and lifting his body mostly with his legs. The other members of the rope team belay or secure the rope, paying it out to the leader as he needs it. The rope may be belayed around the climbers' bodies, on projecting rocks, or by means of pitons. Pitons are steel spikes with an eye, which are driven solidly into a crack in the rock by a piton hammer. A snaplink or *Karabiner* is snapped into the eye of the piton, and the rope in turn is snapped into this. A piton may be on the same level as the belayer, or may be driven part way up a long lead to give the leader protection at a point well above his companions. When he reaches a secure belay point, he belays his second man as the latter climbs up to him. Only on comparatively easy rocks does the whole party climb simultaneously.

Pitons may also be used as a direct aid when holds are too small. In this rope-tension climbing the leader drives a piton as high above him as he can, and attaches the rope to it by means of a snaplink. As he leans out against the tension of the rope firmly held below, his feet adhere even to vertical faces. He climbs slowly upward,

while the second man keeps taking in the rope. A stirrup may be hung from a piton to allow a climber to surmount an overhang.

Climbing down may prove to be troublesome because of the difficulty of seeing what lies below; on a steep or overhanging descent it may be necessary to rope down or *rappel*. The middle of the rope is laid over a projecting rock, through a loop or rope or through a piton, and the two ends are allowed to drop. The climber then winds both strands around his body in such a way that he can slide in a sitting position slowly down the rope with complete control. After the last man has descended, the rope is brought down by pulling on one end of it, until it has been pulled over the *rappel* point and drops down.

Snow and Ice Climbing.—Snow and ice climbing may involve travel on a glacier or the ascent of steep slopes and ridges. Under all circumstances the climber must wear dark glasses to avoid snow blindness. The ice ax, which serves here as in other types of terrain as a walking stick and an aid to balance, is essential. On a glacier, especially where crevasses may lie hidden under winter snow, the ice ax is used to probe for crevasses and to test how solid the snow bridges across them are. The ice ax is also driven into the snow or ice to act as a belay point both in crevassed areas and on steep slopes. On steep slopes the leader frequently has to cut steps in the ice or hard snow in order to give good footing. Crampons are an additional aid on hard snow and ice. They are a framework of steel spikes which can be strapped onto the bottom of the boots to give excellent traction. Special ice pitons are also sometimes used.

HISTORY

Europe.—Mont Blanc (15,781 feet), highest of the Alps, was the first mountain to attract climbers. Although the Genevan scientist Horace Bénédict de Saussure offered a prize in 1760 to the first person who would climb the mountain, it was not until 1786 that the physician Michel Gabriel Paccard and the peasant Jacques Balmat reached the summit. De Saussure climbed the peak the following year with Balmat and other guides. In 1800 the Grossglockner and in 1804 the Ortler were climbed. The Swiss brothers Rudolph Johann and Hieronymus Meyer reached the summit of the Jungfrau in 1811, and in 1829 the guides of Franz Joseph Hugi climbed the Finsteraarhorn, the highest peak of the Bernese Oberland.

Climbing, however, remained sporadic until Sir Alfred Wills' ascent of the Wetterhorn in 1854 opened the "golden age" of mountaineering. Peak after peak was conquered, mainly through the efforts of English climbers, who founded the Alpine Club in 1857. The highest summit of Monte Rosa was surmounted in 1855. John Tyndall and his guide, Johann Joseph Bennen, ascended the Weisshorn in 1861. The golden age was brought to a close in 1865 with the tragic ascent of the last of the great Alpine peaks, the Matterhorn, by Edward Whymper and his unfortunate companions. By 1900 nearly every Alpine summit had been climbed. Since then remarkable new routes have been ascended, many of them incredibly difficult.

An English party under Douglas W. Freshfield explored the Caucasus for the first time in 1868 and climbed the east peak of Elbrus and Kazbek. In 1874 F. Crauford Grove, Francis

Walker, Frederick Gardiner, and the Swiss guide Peter Knobel reached the main summit of Elbrus (18,481 feet), the highest point in Europe. In 1888 the remaining principal Caucasian summits, Shkara, Janga-Tau, Koshtan-Tau, Dykh-Tau, and the north peak of Ushba fell to English climbers.

Africa.—Africa's highest summit, Kilimanjaro (19,565 feet), was reached by the Germans Hans Meyer and Ludwig Purtscheller in 1889. More difficult Kenya (17,040 feet) fell to Sir Halford J. Mackinder's party in 1899. In 1906 Prince Luigi Amedeo of Savoy-Aosta, duke of the Abruzzi, managed to ascend Ruwenzori (16,795 feet), although plagued by the incessantly bad weather which had prevented earlier parties from succeeding.

Asia.—The Himalayas have long been the goal of mountaineering expeditions. Shilla (23,050 feet), climbed by surveyors in 1851, held the altitude record for the highest summit yet reached, until Tom G. Longstaff ascended Trisul in 1907 (if W. W. Graham's disputed ascent of 24,002-foot Kabru is not accepted). Lenin Peak (formerly Mount Kaufmann, 23,382 feet) in the Pamirs next held the record after Eugen Allwein, Erwin Schneider, and Karl Wien climbed it in 1928. Jonsong Peak (24,340 feet), climbed by Francis S. Smythe, Gunther O. Dyhrenfurth, and others in 1930, and Kamet (25,447 feet), ascended by Smythe's party in 1931, next held the record. The next year the Americans, Terris Moore and Richard L. Burdsall, narrowly missed the record when they climbed Minya Konka (24,900 feet) in western China. In 1936 Noel E. Odell and H. W. Tilman of the American-British party on Nanda Devi (25,645 feet) achieved the record which was to stand for 14 years. The French Maurice Herzog and Louis Lachenal in 1950 were successful on Annapurna (26,492 feet), and held the record until Sir Edmund P. Hillary and Tenzing Norgay finally reached the crest of Mount Everest (29,028 feet) in 1953.

Early exploration of the Himalayas was carried on mainly by the British: W. W. Graham (1883) in Sikkim and Garhwal, India; Sir William Martin Conway (1892) in the Karakoram Range; Freshfield (1889) around Kanchenjunga. The Americans Dr. and Mrs. William Hunter Workman made six expeditions between 1899 and 1912. K² (28,250 feet), second highest mountain in the world, was attacked by the duke of the Abruzzi, who declared it unclimbable. Charles S. Houston and Paul Petzoldt of the 1938 American expedition reached 25,600 feet on K² before time and food ran out. Fritz Wiessner and Pasang Dawa Lama got to 27,500 feet in 1939, but unfortunately one American and three Sherpa porters were lost. In 1953 the third American K² expedition, led by Dr. Charles S. Houston, after weeks of bad weather, was driven from its camp VIII at the base of the summit pyramid to carry down seriously ill Arthur Gilkey, who was tragically lost during the descent. A strong Italian expedition led by Professor Ardito Desio finally climbed K². Following the American route, Achille Compagnoni and Lino Lacedelli reached the summit of K² on July 31, 1954. Two Bavarian expeditions led by Paul Bauer in 1929 and 1931, to Kanchenjunga (28,146 feet), third highest mountain in the world, failed on the exceedingly difficult northeast spur; their high point was 25,263 feet. The 1930 Dyhrenfurth expedition to the same mountain failed on the northwest because of avalanches.

A British expedition, led by Dr. Charles Evans, successfully ascended the incredibly difficult southwest face of Kanchenjunga from the Yalung Glacier. On successive days, May 25 and 26, 1955, two separate pairs reached the summit. These were George Band with Joseph Brown, and Norman Hardie with H. R. Anthony Streather. Nanga Parbat (26,660 feet) was attacked in 1895 by Alfred F. Mummery, who disappeared with his porters, and in 1932, 1934, 1937, 1938, and 1939 by German expeditions. The lives of 14 climbers and 17 porters were lost on the mountain before Herman Buhl made his successful climb in 1953. The world's fifth and sixth highest peaks have also been ascended. Makalu (27,790 feet) fell to a French party, which made the remarkable achievement of getting to the top all the Frenchmen: Lionel Terray, Jean Couzy, Jean Franco (leader), Guido Magnone, Jean Bouvier, Pierre Leroux, Serge Coupe, and André Vialatte, and the Sherpa Gyalzen in mid-May 1955. Cho Oyu (26,867 feet) was climbed by the ultra-light-weight expedition under the Austrian Dr. Herbert Tichy on Oct. 19, 1954. Dr. Tichy was accompanied on this expedition by Sepp Jochler and the Sherpa Pasang Dawa Lama.

Seven British attacks (1921, 1922, 1924, 1933, 1935, 1936, and 1938) on Mount Everest from the northern Tibetan side all ended in failure. In 1924 Edward F. Norton and Theodore H. Somervell reached over 28,000 feet, a point equaled but not exceeded, by later climbers on this route. In this same year George Leigh Mallory and Andrew C. Irvine climbed into the mists high on the mountain, never to be seen again. The route to the southern Nepalese side was reconnoitered by American Dr. Charles S. Houston and British H. W. Tilman in 1950. A British expedition under Eric Shipton failed in the Khumbu region in 1951. The next year the Swiss successfully pioneered a route over the South Col, and Raymond Lambert and Tenzing reached a point only about 900 feet from the summit. Hillary and Tenzing made the first ascent of Everest on the same route.

South America.—The Ecuadorian Andes received early attention. In 1872 the German Wilhelm Reiss with A. M. Escobar climbed the world's highest active volcano, 19,344-foot Cotopaxi. Eight years later Whymper ascended Chimborazo (20,577 feet) and other nearby peaks. The highest mountain in the Western Hemisphere, Aconcagua (22,835 feet) in Argentina, was unsuccessfully attempted by the German Paul Güssfeldt in 1883. Mattias Zurbriggen of the Edward A. Fitzgerald expedition of 1897 made the first ascent alone. The same expedition also surmounted Tupungato (21,490 feet) in the Andes, which rises to an altitude of 21,185 feet above the Bolivian capital of La Paz, was climbed in 1898 by Sir William Martin Conway. Americans have played a part, too, in the conquest of the Andes. In 1908 Miss Annie S. Peck added Huascarán, the highest Peruvian peak (22,265 feet), to her list of first ascents. Three years later Hiram Bingham's Yale Peruvian expedition made the first ascent of Coropuna (21,696 feet). Since World War II Americans have again been active in the Peruvian Andes. James C. Maxwe and David Harrah with a Harvard expedition in 1950 climbed extremely difficult Yerupaja (21,758 feet), and most of the same group joined a small French party to scale 20,550-foot Salcantay in 1952. spire in Chilean Patagonia, was climbed by the French Lionel Terray and Guido Magnone in the same year.

North America.—Gigantic St. Elias, rising to 18,008 feet from tidewater, was the first peak in Alaska to attract climbers. Israel C. Russell's second expedition in 1891 reached 14,500 feet. The mountain was finally climbed in 1897 by the duke of the Abruzzi on the sixth expedition to the peak. Mount Wrangell (14,005 feet) was ascended in 1908 by Robert Dunn and William Suttle, and four years later Miss Dora Keen and G. W. Handy climbed Mount Blackburn (16,140 feet). The highest point in North America, Mount McKinley (20,270 feet), was explored by Dr. Frederick A. Cook of North Pole fame, who falsely claimed to have climbed it in 1906. In 1910 two Alaskan prospectors, Pete Anderson and Billy Taylor, climbed the north peak, some 300 feet lower than the main summit, ascending 9,000 feet from the Muldrow Glacier in one day. Belmore Browne and Herschel C. Parker reached a point only 300 feet from the summit in 1912 before being driven back by storm. The next year Archdeacon Hudson Stuck's party completed the ascent. Since World War II various new routes have been made up Mount McKinley. The high mountain in Canada, across the border in Yukon Territory, Mount Logan (19,850 feet) fell to a Canadian-American party under the leadership of Capt. Albert H. MacCarthy in 1924. In the 1930's a large number of Alaskan and Yukon peaks were first successfully climbed, many under the leadership of Bradford Washburn, Alaska's leading explorer-mountaineer. These included Mounts Foraker (17,280 feet), Lucania (17,150 feet), Sanford, Crillon, St. Agnes, Hayes, Bona, Fairweather, and Steele. Since World War II most of the other Alaskan and Yukon giants have been climbed, including Mounts King, Vancouver, Hubbard, and Alverstone.

After many unsuccessful earlier attempts the highest of the Canadian Rockies, 12,972-foot Mount Robson, was ascended by William W. Foster and A. H. MacCarthy with the guide Conrad Kain in 1913. This ascent has rarely been repeated. The highest summit of the interior ranges, Mount Sir Sandford (11,590 feet) in the Selkirks, was first climbed in 1912 by Edward W. D. Holway and Howard Palmer, with the Swiss guides Rudolph Ammer and Edward Feuz. Mount Waddington (13,240 feet), the highest point in the British Columbia Coast Mountains, successfully resisted a dozen serious attempts, until William House and Fritz Wiessner forced their way to the summit of the ice-coated sheer spire in 1936.

Mountain climbing is an important sport in many of the lower ranges of the United States, such as the White and Green Mountains and the Adirondacks of the Northeast. Regions calling for more advanced technique include the Tetons and Wind River Range of Wyoming, the Colorado Rockies, the Cascades and Olympics of the Northwest, and the Sierras of California. Major mountaineering clubs are the American Alpine Club with headquarters in New York, N. Y.; Appalachian Mountain Club, Boston, Mass.; Colorado Mountain Club, Denver, Colo.; Iowa Mountaineers, Iowa City, Iowa; Mazamas, Portland, Oreg.; Mountaineers, Seattle, Wash.; Sierra Club, San Francisco, Calif.; and the Alpine Club of Canada.

MOUNTAIN GOAT. See ROCKY MOUNTAIN GOAT.

MOUNTAIN GROVE, city, Missouri, in Wright County in the southern part of the state, 55 miles east of Springfield. The city lies in the Ozark Mountains, at an altitude of 1,475 feet, on the St. Louis-San Francisco Railway. The surrounding area is an agricultural and timber region, and Mountain Grove has become a trade center, where dairy produce, lumber, and shoes are manufactured and are also distributed. Pop. (1950) 3,106.

MOUNTAIN LAUREL, a shrub or occasionally a small tree, *Kalmia latifolia*, in the heath family (Ericaceae), also called calico bush and spoonwood. It sometimes attains a height of 40 feet and a diameter of 18 inches near the base, but usually is smaller. The leaves, mostly grouped near the ends of the branches, are alternate, opposite, or in whorls of three, evergreen, leathery, dark green above, lighter below. They are two to four inches long and about one inch wide. The attractive, showy flowers are approximately an inch across, borne on glandular-hairy stalks, and clustered. They are white to pink, with purplish markings inside. The 10 anthers of each flower are inserted in pouches in the fused corolla. If an insect probing for nectar touches the stamens at the base of the filaments when the flowers are mature, the anthers spring free and discharge pollen from the pores by which they open, onto the insect's body; the same effect may be produced by touching the stamens with the point of a pencil. The fruit is a thick-walled, dark, five-celled capsule. A variety of *K. latifolia* with deep pink petals, another with the petals separate, and a third with smaller leaves, have been described. Mountain laurel is native of eastern North America, where it extends from New Brunswick and Ontario to Indiana, and south through the Appalachians to Louisiana and Florida. It grows along rocky stream banks or in gravelly soil, in acid conditions, usually in shade, but also in the open if moisture is sufficient, and at times in swamps. It is often used as an ornamental in eastern North America, more sparingly in Europe. The sheep laurel, *K. angustifolia*, and the swamp laurel, *K. polifolia*, of North America, are related to the mountain laurel, but not the laurel of the classics and of poetry, which is *Laurus nobilis* of the Mediterranean region.

MOUNTAIN LION, a popular name in the United States for the large American unspotted cat more generally known as puma (q.v.).

MOUNTAIN MEADOWS MASSACRE, the slaughter of a party of California-bound emigrants near Mountain Meadows, Utah, in Washington County, in September 1857. The emigrants, numbering about 137 persons from Arkansas and Missouri, were attacked by a large band of Indians, while encamped at Mountain Meadows. They held their own for three days, when they were promised safe passage by John D. Lee (q.v.), a Mormon elder and settler. Leaving the protection of their wagon barricades, they were treacherously attacked and killed by a party of Indians and whites, under the leadership of Lee. Only 17 small children were spared. The Mormons were generally blamed for the deed, although their leader, Brigham Young, had pledged his people to protect non-Mormons from Indian violence. The actual attack was probably precipitated by the lawless arrogance of the emigrants themselves, although the Mormons' fear of an impending punitive expedition by the federal government may also have been a contributing cause. The case was investigated for many years, and Lee was finally brought to trial in 1875, 18 years after the event. He was convicted and executed (1877), but a number of others accused of complicity went free.

MOUNTAIN MEN, fur trappers and traders who explored the region west of the Rocky Mountains in the 1820's and 1830's. The Western fur trade really began with the St. Louis Missouri Fur Company, chartered in 1809 under the leadership of Manuel Lisa, Pierre and Auguste P. Chouteau, and William Clark of the Lewis and Clark expedition. Later John Jacob Astor's American Fur Company entered the field. The advent of the mountain men, however, began with the company formed in 1822 by William H. Ashley (q.v.), later known as the Rocky Mountain Fur Company. Ashley meant to confine activities to trapping and trading in the familiar area of the Missouri Valley, but competition drove his trappers into the unknown regions of the Rockies, where they were forced into the way of living peculiar to the mountain men. Many of the great trappers were associated with Ashley: James Bridger, Thomas Fitzpatrick, Christopher (Kit) Carson (q.v.), Henry Fraeb, Jedediah Smith, and the Sublette brothers, William and Milton. These men, singly or in small groups, made the first trails to Oregon and California, and the routes which they followed have become the major highways of today.

There were three types of mountain men: the hired trapper, paid an annual wage by a fur company; the skin trapper, who dealt with a single company; and the free trapper, aristocrat of the trade, who trapped and disposed of his furs as he pleased. The latter was most typical of the true mountain man. Mountain men were of various origins: French, Spanish, and American; but the stringent demands of their existence stamped out all differences, and they became a group apart, more savage than civilized.

The life of the trapper was a hazardous one; his enemies included the land, the Indian, and the rival trapper. The heyday of the Western fur trade was marked by fierce competition, and every means was used to hamper the activities of rival trappers, including the instigation of Indian attacks. The land was strange and hostile, and the

trapper moved always deeper into unknown territory in his relentless search for beaver. He fought the Indians and lived with them; he adopted the way of life, their clothing, food, and shelter, and married their women. Men chose this life for adventure, for money, or as a refuge from the law and their way of life became legendary.

Each spring the trappers gathered at a predestined spot in a mountain valley, usually in Utah or Wyoming. This meeting, known as the trappers' rendezvous, became the characteristic institution of the mountain men. To it came trappers and traders, Indians and white men, and caravans from St. Louis laden with supplies of food and luxuries to trade for furs. There the trapper disposed of his year's haul, and usually spent his earnings in a few days' riotous living, often going into debt for much of his next season's catch.

By 1840 the beaver hat was unfashionable as the price of pelts dropped radically. The fur trade declined, and the trappers became traders, Indian scouts, and guides, leading missionaries and homesteaders over the trails and routes which they had broken. See also the section on *History* in the following articles: MISSOURI; MONTANA; S. LOUIS; WYOMING.

MOUNTAIN PROVINCE, province, Philippines, comprising the northern inland section of Luzon Island, between latitudes 16° and 18° N. and longitude 121° E. It is the largest province in Luzon, with an area of 5,458 square miles and a population (1948) of 278,120. The population density is 51.0 persons per square mile. The province lies mostly in mountainous terrain, and includes in its southern area all of the Cordillera Central; in the north are the eastern slopes of the same range. Mountain Province is bounded by the provinces of Cagayan, Isabela, and Nueva Vizcaya on the east, and Abra, the Ilocos, and La Union on the west. There are many rivers; the Maguindanao forms part of the eastern boundary, and the Chico traverses the eastern and central sections, the Agno and Abra rivers drain the south. The climate is hot and humid, and the temperature zone begins only after an altitude of over 4,000 feet is reached. The highest peaks in the province are Mounts Pulog (9,606 feet), Cautitan (8,427 feet) and Santa Tomas (7,480 feet).

Mountain Province is composed of five subprovinces: Apayao, Benguet, Bontoc, Ifugao, and Kalinga. It has 38 towns, the provincial capital being Bontoc (pop. 1948, 15,005) in Bontoc Subprovince. Baguio (pop. 1952, 31,510), 125 miles northwest of Manila, is the cultural and educational center. It is geographically located in Benguet, but has been removed from provincial jurisdiction, and is administered by the central government, of which it is the summer capital. Baguio has a mean annual temperature of 64.2°F., about 17 degrees cooler than elsewhere in the Philippines, and consequently has become a popular modern resort.

Mountain Province is an important educational center, with 415 elementary, intermediate, and secondary schools, and eight colleges. Economically the most developed area is Benguet in the south. It is also the most densely populated subprovince with about 106 persons per square mile.

The province is largely inhabited by native tribes of Apayaos, Bontocs, Igorots, Ifugaos, and Kalingas, nagans of Malayan stock, who have dis-

veloped an ingenious agricultural and irrigation system, and do very fine metalwork, wood carving and pottery making. The Banaue rice terraces in Ifugao Subprovince are world famous. Built over a period of 1,500 years by the Igorot tribes, they are an astounding feat of engineering. They extend for a distance of 1,200 miles, and rise step-like up the steep mountain sides to a height of 4,000 feet.

Economic Development.—Farming is the dominant occupation. Trinidad Valley in Benguet Subprovince is an important vegetable-growing center, and excellent tobacco is grown in Apayao. The most important crop is rice, but only enough is grown in the province to supply 50 per cent of its needs. About 25 per cent of the rice grown is used in making *tapey* (rice wine). Fruit-growing, cattle-raising, and poultry-raising projects are being systematically encouraged and developed.

Lumbering is an important factor in the economic life of the province. Luxuriant pine forests in Benguet and Apayao supply the nation's building industry with much of its raw material. In 1953 the output of the largest lumber concern ran 500,000 board feet per month, only about 25 per cent of the prewar output, but adequate for current needs.

Mining is another important factor in the province's economy. The largest copper and gold mines in the Far East are located at Mankayan, in Bontoc, about 35 miles north of Baguio. In 1952 the Lepanto-Consolidated produced 12,462 tons of copper, and four mines produced 335,403 ounces of gold and 372,415 ounces of silver.

Resources of water power, largely neglected until recently, are being rapidly developed. The Aco River Project is the biggest source of water power in Luzon. Seven plants, when completed, will develop 430,000 kilowatts, with an energy availability of 1.5 billion kilowatt hours. Six of these, with a total of 355,000 kilowatts, are to be located in Benguet. An earth dam, 450 feet high, is being built at Ambukloa in Benguet, to store 200 million cubic meters of water, and a 75,000-kilowatt power plant, under construction at Ambukloa, was scheduled to be completed in mid-1955. A single circuit 230,000-volt line will transmit inexpensive power to Manila, and a 69,000-volt line will furnish power to Baguio.

Transportation.—A north-south highway connects Mountain Province with Manila, and runs northward through Baguio and Bontoc to Tabuk in Kalinga Subprovince. Two east-west routes connect with neighboring provinces, and a railroad runs to the extreme south. Commercial air services operate between Manila and Baguio only.

History.—The region was not organized politically by the Spaniards until the mid-19th century. Under American rule Mountain Province was organized as a separate province under its present name in 1908; Baguio was incorporated and separated administratively in 1909. In 1920 the number of subprovinces was reduced from seven to five, and by 1939 the various boundaries were fixed at about their present limits.

MOUNTAIN SHEEP, a general term for wild sheep, found in Asia, North America, and a few places in the Mediterranean basin. Mountain sheep are the boldest and most active rock climbers of all land animals except wild goats and ibexes, and wherever found, they inhabit the highest, most rugged places. The haunts of the Rocky Mountain bighorn include not only the highest moun-

tains and wild tracts of badlands, but also the rocky walls of the Grand Canyon of the Colorado. It is not strange, therefore, that the chase of wild sheep is a favorite sport with big-game hunters. The head of an old ram, adorned with massive circling horns, won by dangerous mountain climbing and fair stalking, is a trophy of which any sportsman may be proud.

The wild sheep is generally characterized by its large, spiraling horns, which often reach more than a full circle in old rams, but are much smaller in the ewes. Wild sheep are not wool bearers. Next to the skin is a coat of fine woolly hair, which serves for warmth; through this grows a coat of long, coarse hairs, large in diameter, pithy within, and easily broken, which does duty as a raincoat and gives the animal its distinctive color. In summer or late spring the old pelage is shed, and the new coat is only half an inch in length. At that season the skin is worthless as a trophy. Mountain sheep are at their best in October, November, and December, and should be hunted at no other time. The lambs are born in May, with one or two at a birth. The life span may reach 15 years, but is usually less because of disease and lack of food. Due to the difficulty of keeping captive mountain sheep of any American species alive until they reach full maturity, members of the wild species are unfamiliar to the general public in America.

Asia, Africa, and Europe.—It is probable that the first wild sheep were developed in south central Asia, in the region of the Altai Mountains in western Mongolia. Favorable conditions there have developed the Siberian argali (*Ovis ammon*), whose enormous horns are a wonder to all who behold them. A comparatively short distance southward in Tibet is the Marco Polo sheep (*O. poli*), characterized by the enormous spread of its horns. The longest horn recorded measures 75 inches in length on the great curve. South of the range of *O. poli*, in northern India, occurs the Punjab wild sheep, and the beautiful bharal or blue sheep (*Pseudois nathura*), both of them small species. Outside of Asia in the Eastern Hemisphere there are only two species of wild sheep, the small but handsomely colored mouflon (*O. musimon*) of Corsica and Sardinia, and the large Barbary wild sheep, or aoudad (*Ammotragus lervia*) of the mountains of North Africa. North of the range of the Siberian argali are the Kamchatkan sheep, a species with horns like the North American white sheep, but otherwise strongly resembling the bighorn.

North America.—North America contains a fine series of mountain-sheep species, which almost cover the mountainous regions of Alaska, and extend down the Rocky Mountain system to the region of Lake Santa Maria (latitude 30°) in northern Mexico. In addition a species known as Nelson's mountain sheep branches off in southwestern Nevada and extends through southern California for two thirds of its length.

There are three conspicuous and well-marked types of North American mountain sheep, as well as three offshoots, as follows:

Types	Offshoots
Bighorn (<i>O. canadensis</i>)	Nelson's sheep (<i>O. nelsoni</i>) Mexican sheep (<i>O. mexicanus</i>)
Black sheep (<i>O. stoneri</i>)	
White sheep (<i>O. dalli</i>)	Fannin's sheep (<i>O. fannini</i>)

The total area of North America inhabited by mountain sheep is about 3,500 miles from north to south, and the greatest width from east to west, found in Alaska, is more than 1,000 miles.

Ovis canadensis.—The Rocky Mountain bighorn, known since 1803, is the most widely recognized North American species, all the others being of much more recent appearance. The range of the bighorn extends from latitude 55° and longitude 120° to San Francisco Mountain, Arizona, embracing the whole main range of the Rockies between those points. It also includes the Fraser River country in British Columbia, one locality in northern Washington, two in eastern Oregon, the counties of Custer and Dawson in Montana, the Black Hills and Big Horn Mountains of Wyoming, four localities in Utah, and the Grand Canyon of the Colorado.

The bighorn is the largest and heaviest species of American mountain sheep, and carries the most massive horns. They are largest in the north, maximum development being reached in the main range of the Rocky Mountains in western Alberta. A large ram stands 40 inches in height at the shoulders and weighs about 300 pounds. The horns curve back, out, and up, and show yearly growth rings, which end after 8-10 years. They have been known to reach a length of 49 inches, although over 40 inches is not usual.

Ovis dalli.—The white mountain sheep of Alaska became known in 1884. It inhabits nearly all the mountainous regions of Alaska, except the Alaska Peninsula, the valley of the Kuskokwim, and the lower valley of the Yukon. Until recently it has been quite abundant on the Kenai Peninsula and around the head of Cook Inlet. The animal may be pure white, with a long, abundant winter pelage. It is smaller than the bighorn, and its horns are more slender, never exceeding 15½ inches in circumference. Its northern range extends almost to the Arctic Ocean, and the southern limit is found at latitude 58°.

Ovis stonei.—The black mountain sheep was discovered in 1896 in northern British Columbia, and good specimens may be seen in the museums of New York, Chicago, and Washington. Its size is the same as that of *O. dalli*. The species is characterized by the wide spread of its horns, and the very dark color of its pelage, except for the white of the rump patch and the abdomen. The range of this species is circumscribed to a small area in northern British Columbia.

Offshoots.—Fannin's mountain sheep, often called the "saddle-backed sheep," was discovered on the Klondike River near Dawson, in the Yukon, in 1900. It is an offshoot of the white sheep, and is possibly the result of crossbreeding between that species and the black sheep. Its back, sides, and tail are bluish gray, and a brown band extends down the front of each leg; all other parts of the animal are white, and its horns are like those of the white sheep. Little is known of the range of this species.

The Mexican sheep and Nelson's sheep are both offshoots of the bighorn. They are short-haired and large-horned, and their prevailing color is pale salmon gray.

Wherever they are not fully protected by law, all species of American mountain sheep are hunted and killed, for sport and for food, while overgrazing and disease have further reduced their number. Their extinction can be prevented only by careful protection. The bighorn quickly learns the value of protection, and the herd in Yellow-

stone National Park has rapidly increased and become so tame that it permits visitors to approach within 30 paces.

MOUNTAIN SICKNESS, a form of altitude sickness caused by reduced atmospheric pressure, or, more precisely, by reduced partial pressure of oxygen in the lungs, bloodstream, and tissues. It is common in persons reaching altitudes of over 12,000 feet, especially in mountain climbing. Aviators suffer a form of this disorder, but with a reaction quite distinct from mountain sickness. The aviator attains great altitude quickly and effortlessly, while the mountaineer rises slowly, but with extreme physical exertion. (See AVIATION SICKNESS.)

MOUNTAIN VIEW, village, Alaska, located in the Third Judicial Division, in the south central part of the territory. The sixth largest town in Alaska, Mountain View is a suburb of Anchorage. Pop. (1950) 2,880.

MOUNTAIN VIEW, city, California, in Santa Clara County, on San Francisco Bay, 34 miles south of San Francisco, in the west central section of the state, at an altitude of 95 feet. The city is located on a U.S. highway, and is served by the Southern Pacific railway lines. Classed as a residential and semiagricultural community. Mountain View has fruit and vegetable canneries, produces olive oil, and is a printing and publishing center. Mountain View House, a pioneer inn, was formerly a main stop on the San Francisco-San Jose stage coach line. Pop. (1950) 6,563.

MOUNTAINS, the term applied to natural elevations loftier than hills. The distinction is relative, since heights termed mountains in low-lying regions would be lost among the foothills of a more rugged terrain. Single mountains are commonly called *peaks*; connected peaks, a *ridge*; an elongated ridge, a mountain *chain* or *range*; a series of ranges, often roughly parallel, a *system*; while a number of systems may be grouped in a *cordillera*.

Formation.—Mountains have their origin in widespread disturbances in the earth crust. They rear like waves whose movement is measured not in moments but in millions of years. The rigid crust is continually adjusting to an unstable interior whose rock, though solid, is rendered plastic by prolonged heat and pressure. In places the crust bends downward beneath accumulations of sediment or ice; in others, when stretched or worn thin, it bulges from interior pressure. Hence, over weakened areas, it may buckle like a crumpled table cover into great folds and hollows known as *anticlines* and *synclines* to form *fold mountains* like the Appalachians. Thus the region which centers in the Swiss Alps once covered an area perhaps a hundred and fifty miles broader than now. Such global convulsions generate enormous lateral pressures which may fracture the folds and thrust them out over neighboring strata. The Matterhorn, one of the most famous of mountains, was

torn from its original base and borne some 20 miles to be upended as a gigantic rock splinter. Even the Himalayas owe something of their height to the encroachments upon the unyielding strata of the Gangetic plain. In crustal breaks where one side drops or the other rises, *fault mountains* may result—common landscape features in Utah and Nevada.

Major systems have risen from elongated troughs in shallow seas called *geosynclines*. Into these troughs sediments from neighboring highlands, gathering for ages, accumulated to a depth of thousands of feet. Gradually the weakened crust gave way beneath that weight, drawing the walls ever closer until they collapsed to fill the trough with huge fragments often tilted in every direction. The Rocky Mountains rose from such a gulf which once partially bisected North America, while the loftiest of all peaks, Everest, is capped with limestone strata laid down long ago in the Tethys Sea, which penetrated far into the Asian continent. Such crustal convulsions, by relieving pressure, also permitted the upwelling of molten matter which sometimes overflowed to form such intrusions of igneous rock as cover extensive areas in our Northwestern states. At other times the crustal strata merely bulged as the molten mass beneath solidified into granite formations known as *batholiths*. Mount Blanc encases such a core, whose roots penetrate far into the earth.

Periods of mountain building were succeeded by prolonged intervals of relative calm, only to be followed by later disturbances to confuse the pattern. Meanwhile, the forces of erosion continuously wore away elevated landscapes, so that the Alps now occupy scarcely a quarter of their original volume, and many peaks are but the roots of more ancient summits. Erosion even created *residual mountains* carved from a loftier terrain which has elsewhere disappeared. Mount Monadnock in New Hampshire is typical of such mountain structure.

Peaks of far different origin are *volcanoes*, mere heaps of volcanic ash or lava. Though frequently isolated, they may appear in chains which reveal arcs of weakness in the earth crust, like the backbone of Java or the Aleutian Islands. Their development is sometimes marked by violent eruptions, such as those of Vesuvius, or the terrific explosions of Krakatau (Krakatoa) in the Sunda Strait, or Mount Katmai in Alaska. They are often symmetrical cones like Fuji (Fujiyama) in Japan.

Elsewhere, mountain peaks present a variety of forms, outlines of rare beauty like the Jungfrau, dizzy shafts like the Muztagh Tower in the Karakorum (Karakoram) Range, rounded domes like Chimborazo, or flat summits like the mesas and buttes of our Western states.

Geological time is marked by periods of semi-continental uplift and mountain building, such as the Laramie and Hercynian revolutions. The Altai ranges of Asia and the eroded peaks of the Brazilian and Australian highlands are immeasurably old. On the other hand, sections of the Himalayas, the Andes, and some Alaskan peaks are in a formative period and still rising. Many mountains rear from the ocean bed. Some are volcanic craters that failed to emerge above the surface. Others form great ranges like the Atlantic Ridge, which stretches north and south for some 10,000 miles from Iceland to latitude 55°S.

Effect on Climate.—Mountains have profoundly influenced global climates. In Asia the

Kunlun, the Tien Shan, the Hindu Kush, and other systems, which stretch roughly from west to east, act as barricades against tempering winds and thus subject Siberia to subnormal cold, and India to excessive heat. On the other hand, North American mountain systems, which extend north and south, permit winter blasts to sweep unimpeded from the Arctic to the Gulf of Mexico. The distribution of global moisture is also disturbed so that some regions are deluged by rains, while others become deserts. In India monsoon winds recoil from the impassable ramparts of the Himalayas to flood Assam, while our Southwestern states, now semiarid, were once well watered, until the rise of coastal ranges shut out moisture-laden winds. Even Death Valley was once a lake. Mountains are often called weather breeders, for clouds condense about their summits. Lofty peaks are capped with perpetual snow, even the Ruwenzori Range in equatorial Africa. Such snows, and the resultant glaciers, feed some of the world's great rivers which have their rise in mountain areas. Mountains have developed an alpine flora and fauna. The edelweiss of Switzerland, the cedars of Lebanon, and the giant sequoias of the Sierras are characteristic, as are the chamois of Europe, the yak of high Asia, and the bighorn sheep of North America.

Influence on History and Culture.—Mountains have often determined the trend of human history. They directed the drift of migratory populations from central and western Asia into Europe. Mountain barriers, by isolating the Hellenic states, prevented that racial cohesion which might have made Greece, instead of Rome, the dominant world power. On the other hand, mountains have provided protection, for the Alps were long regarded as the outer walls of Rome. Mountains have always given sanctuary to persecuted minorities; hence, mountaineers are proverbially independent and liberty loving. Mountains have also been prominent in art, literature, and religion. They were the legendary dwelling places of the gods, and such peaks as Olympus in Greece, Horeb in Hebrew tradition, and the lofty summits of the Himalayas became invested with a sacred character.

Mountain scenery is a lure to numberless vacationers, and mountain climbing has become so popular that the conquest of peaks like the Matterhorn, Aconcagua, and Everest have been hailed as landmarks in human achievement. (See Mountain Climbing.) But mountains also have more utilitarian uses. Their slopes provide summer pasturage in regions like the Pyrenees, and many are rich in timber resources. Mountain streams are harnessed to provide water power, which has been aptly termed white coal; and since mountains had their birth in major crustal disturbances, a wealth of mineral deposits has been upturned: manganese in the Caucasus, silver and copper in the Andes, and platinum in the Urals, to mention just a few outstanding examples. See also GEOLOGY; PHYSIOGRAPHY; VOLCANO.

The following table is a partial list of the principal mountain peaks in the world. Those marked with an asterisk (*) have separate articles.

Mountain	Country	Height (feet)
*Everest	Nepal-Tibet	29,028

FERDINAND C. LANE.

MOUNTBATTEN, mount-bāt'n, Louis (Francis Albert Victor Nicholas), 1st EARL MOUNTBATTEN OF BURMA (formerly PRINCE LOUIS FRANCIS OF BATTENBERG), British naval leader and statesman: b. Windsor, England, June 25, 1900. The younger son of Prince Louis Alexander of Battenberg, who changed the family name to Mountbatten during World War I, and Princess Victoria, a granddaughter of Queen Victoria, he entered the Royal Navy as a cadet in 1913, and rose through the ranks to the grade of captain in 1937. During World War II he was called from the command of the aircraft carrier *Illustrrious* in 1941 to become commodore of combined operations, and from 1942 to 1943 was chief of combined operations in the British forces. During this time he was in charge of the troops known as Commandos, and directed the successful invasion of Madagascar. From 1943 to 1946 he held the supreme allied command in Southeast Asia.

In 1947 Mountbatten was created an earl and appointed viceroy of India, the last to hold that office. He then served as governor general (1947-1948), and was responsible for the transfer of sovereign power from Britain to the national government; he also shared responsibility for the separation of Pakistan from India. Resuming his

naval career, he was made admiral (1953), and in March 1955 was appointed first lord and chief of naval staff, the position which his father had been compelled to resign in 1914 because of his German birth.

MOURNING BECOMES ELECTRA, a play by Eugene (Gladstone) O'Neill (q.v.), subtitled *A Trilogy in Fourteen Scenes*, published in 1931. The first performance was given at the Guild Theatre in New York City, Oct. 26, 1931; the playing time was six hours with an intermission for dinner following *Homecoming*, the first play. The play, with six showings a week, ran for 145 performances and was highly successful. The trilogy includes *Homecoming*, *The Hunted*, and *The Haunted*, treating the tragic events in the lives of the Mannon family in New England during the Civil War. General Ezra Mannon, who inherited the fortune made by his father in the shipping business, has not yet returned from the war as the play opens. Living in the grim Mannon mansion are his wife, Christine, and his daughter, Lavinia. There is a terrible and obvious enmity existing between the beautiful Christine and Lavinia, her plain, stern daughter. Vinnie is in love with a romantic sea captain, Adam Brant, but comes to despise him when she discovers that not only is he the son of her grandfather's brother and a servant girl, but that he has also become her mother's lover. Made more stern and cruel by her disillusionment, Lavinia seeks to make her mother pay for her actions by turning the family against her. When General Mannon returns, Christine, who has never loved him, poisons him, hoping to escape from the terrible Mannon family with Adam Brant. Orin, Lavinia's brother, returns from the war still deeply fond of his mother. When Vinnie tells him of Christine's unfaithfulness and the suspected murder of General Mannon, which had been made to seem a heart attack, Orin kills Adam Brant, an act which causes Christine to commit suicide. Lavinia, released from the hatred of Christine, becomes more attractive and less stern and plans to marry Peter Niles, a neighbor. Orin, driven almost to madness by the past events, tries to stop Vinnie's marriage and, sensing failure, kills himself. Peter deserts Vinnie, leaving her alone in the Mannon house to let the ghosts hound her . . . "until the curse is paid out and the last Mannon is let die."

Using the *Electra* story in Greek tragedy as the basis for a modern psychological drama, O'Neill succeeded in approximating the Greek sense of fate. By the interweaving of plot threads it became possible for him to convey to an audience with no belief in supernatural retribution the inexorable ending of a twisted, ghost-ridden family.

MOURNING CLOAK, a butterfly. See CAMBERWELL BEAUTY.

MOUSE, mous, any of a large number of small rodent mammals of the family Muridae, other members of which are called rats, hamsters, voles, and lemmings. The name is also erroneously used for small forms of some of the other rodent families as, for instance, jumping mouse (Dipodidae) and pocket mouse (Heteromyidae). Usage will here, however, be restricted to the Muridae. This is the largest mammalian family in number of species, several hundred, at least, being recognized. It is also extremely widespread, almost cosmopolitan in distribution as far as wild forms are concerned, and in addition, several species, having become associated with man, are now found everywhere that man has penetrated. Though differing greatly in body size and in the form and size of the ears and limbs, all have hairy bodies and a moderately pointed head. The incisor or front teeth as in all rodents are modified to form gnawing chisels while the canine teeth are absent and the cheek teeth reduced to the three molars above and below. The tail is usually rather long and may be either densely haired or largely covered by scales. Five toes are normally present on each hind foot, but on the front foot the pollex or thumb is greatly reduced.

The classification of the Muridae is by no means settled, but the following major divisions or subfamilies are generally recognized: Cricetinae, Lophomyinae, Microtinae, Gerbillinae, Murinae, Dendromurinae, Otomyinae, Rhynchomyinae, and Hydromyinae.

The subfamily Cricetinae contains all of the native long-tailed mice of the Western Hemisphere together with a few Eurasian and African forms, most of which are short-tailed and called hamsters. One of the latter, the golden hamster (*Mesocricetus auratus*), has, since 1930, become well known as a pet and laboratory animal. The best known North American forms of small or mouse size are the deer and white-footed mice (*Peromyscus*) represented by numerous species, many of them living in forests and among the commonest of small mammals. Others are the American harvest mice (*Reithrodontomys*), which occur chiefly in fields and marshes, and the grasshopper mice (*Onychomys*). The latter, occurring in plains and deserts, are unusual both for their relatively short tails and their insect-eating habits. The Cricetinae are represented by a great many forms in South America, where they constitute the only subfamily of mouse-like rodents.

The subfamily Lophomyinae contains a single form, the highly peculiar African maned rat (*Lophiomys*). The subfamily Microtinae includes the forms known as voles or field mice, and lemmings. They are confined to Eurasia and North America, inhabiting chiefly the cooler regions. Most have quite short necks, ears, and tails, and all have very complex molar teeth.

The subfamily Gerbillinae consists of a number of African and Asiatic species known as gerbils or jirds. All are desert forms, nocturnal in habit, and spending the day in burrows. The hind legs are greatly elongated, the animal hopping rather than running or walking. This type of adaptive modification is repeated in many desert rodents.

The subfamily Murinae includes a tremendous variety of forms, restricted, however, as wild native forms, to the Eastern Hemisphere, where they occur chiefly in tropical regions. All the species of Muridae which have become associated

with man belong to this subfamily, however, and in this way it has become worldwide in distribution. Attention will be confined to the smaller mouse-sized forms. Some species are called field mice in Europe, but are quite distinct from North American voles called field mice. Several forms in southeastern Asia are remarkable in that the hallux or big toe is opposable like that of a monkey, and as a result the hind foot can be used for grasping small branches, enabling the animals to climb about the trees in which they live. The Old World harvest mice (*Micromys*) are somewhat similar, but as a result of their very small size (among the smallest of rodents), are able to climb up grass stems, around which they build small spherical nests. On the other hand, certain Australian forms (*Notomys*) show hopping desert modifications with large ears, a tufted tail, and greatly elongated hind legs and feet.

The best-known mouse and the form to which the name applies in its narrowest sense is the house mouse (*Mus musculus*). As a native wild animal it is confined to Eurasia and northwestern Africa, but has become cosmopolitan by accidental human introduction. As a result, the various stocks show a great deal of variation. Thus, most wild individuals have white bellies, whereas strictly commensal stocks (living in human habitations) have gray bellies. The high degree of variability together with their abundance and ease of capture have caused them to be utilized to a great extent as a pet and laboratory animal (particularly the all-white or albino variety which has arisen under domestication). A great deal of medical and biological research, particularly on methods of inheritance, has been done since 1900 using house mice. As a semiwild or commensal form around houses and other buildings, however, *Mus musculus* is often a serious pest, destroying considerable quantities of stored food and other materials. In many places, on the other hand, house mice have invaded neighboring fields and open country. This has been facilitated by their high reproductive rate, several litters a year being produced by each female.

The subfamily Dendromurinae includes a number of African species known as tree mice and fat mice, most forms living in tropical forest. Some species are eaten by African natives. The subfamily Otomyinae contains only the African swamp rats. The subfamily Rhynchomyinae consists of a single species, the Philippine shrew-rat (*Rhynchomys soricoides*), known only from the mountains of Luzon, where it probably feeds on worms and small insects. The fur is very soft and the teeth greatly reduced in size and number. It may be related to certain forms included in the Murinae from the Malay archipelago, particularly Celebes.

The subfamily Hydromyinae contains a number of species from Australia, New Guinea, and the Philippines. Most are called water rats, though some are more or less terrestrial and others are small enough to be called mice. Most of them are, however, aquatic, and show a reduction in the number of molar teeth. See also HAMSTER; LEMMING; RAT; VOLE.

KARL KOOPMAN.

MOUSE DEER. See CHEVROTAIN.

MOUSEBIRDS, a group of peculiar birds of central Africa, constituting the family Coliidae also known as colies. They are of small size, grayish colors, marked with darker tints and in some species with touches of brighter colors; have finchlike beaks, crests, short weak wings, very long tails and remarkably strong feet. They are active, but fly little, spending their lives mostly in creeping about the branches of trees in a way that with their dun colors strongly suggests the behavior of mice. They are fond of hanging head downward, and at night gather in bands that roost together in hanging postures as closely as they can crowd. Their food consists mainly of fruit; and they place their cupshaped nests in low trees and bushes.

MOUSTERIAN. See STONE AGE—Moustarian Stage.

MOUTH, in human anatomy, the oral cavity at the beginning of the alimentary tract. It contains the tongue and the teeth and is the opening through which food is received and through which the voice issues. The mouth receives the secretions of the salivary glands. See also ALIMENTARY TRACT; SALIVARY GLANDS.

MOVING PICTURES. The moving picture, or motion picture, is the most completely explicit of the media of communication which address the eye, primary organ of perception. With its complement of sound and speech it is the most elaborately complete of the arts of recording and expression. Commonly considered apart, it is in fact much akin to all the older arts, which like it have been progressively powered by the development of tools and technologies.

The subject is dealt with in the following pages under four main headings:

The History of Moving Pictures
The Art of the Moving Picture
Documentary Moving Pictures
Educational Films

Other aspects of the subject are discussed in the following articles: CARTOON, ANIMATED; MAKE-UP—*Motion Picture Make-Up*, and *Photographic Make-Up: Amateur and Professional*; PHOTOGRAPHY—*Motion Picture Photography*, and *Visual Education and Documentary Photography*. There are also special sections on the motion picture in the articles on FRANCE, GREAT BRITAIN, and MEXICO.

THE HISTORY OF MOVING PICTURES

In little more than half a century the motion picture has achieved a worldwide dissemination tending to approximate that of printing. Newest of the arts, it is the first and only art to have evolved from the bottom up, born to serve the masses. All the other arts have been handed down from above. The motion picture is so expensive a medium that only mass buying power can afford it.

The motion picture has rapidly expanded its dominion in a turbulence of evolutions, characteristic of its intensive history since the last decade of the 19th century. These evolutions involve politico-economic adjustment to a changing, socially disturbed world, and internally the absorption of the electronic developments of applied science. The principal impact of the latter

MOVING PICTURES

has been in the area of distribution, with the advent of radiographic broadcasting by television.

Television has given the motion picture the novel quality of simultaneity; the spectator is among those present at the moment of production. It also has the quality of propinquity, push-button convenience; it is the motion picture in the home, as available as running water. It is nonetheless a motion picture.

The introduction of television has inevitably caused disturbance in the production and distribution of the entertainment moving picture, the mass audience product known as the "movie," which requires going out to see. Meanwhile television has derived at least half of its presentations from motion pictures recorded on film.

Early History.—The screen achieves its ocular representations by submitting to the eyes a rapid sequence of instantaneous, or snapshot, records of objects in phases of motion. The modern film presents 24 such phase images, or "frames" on film, per second. Those separate instants, in each of which there is no motion, are synthesized by the organs of sight into an appearance of continuous motion. The eye is not sufficiently acute to discern the lack of actual continuity.

The complex of techniques involved have behind them a long, laborious development of optics, kinetics, and photochemistry. Some of it is far back beyond record, but a relatively recent milestone came with the demonstration of the principle of the magic lantern about 1645, when Athanasius Kircher, German Jesuit and professor of mathematics, demonstrated his *Magia Catoptrica*, a device for projecting hand-drawn still transparency pictures on a screen in Rome. This was a beginning, but no further significant advance was made until the early decades of the 19th century.

In 1824 Peter Mark Röget, author of the famous *Thesaurus*, having observed by looking through a Venetian blind that motion could be broken down into a series of separate phases, read a paper on the subject to the Royal Society in London. Others, like Sir John Herschel and Dr. William Henry Fitton, experimented with illusions created by rapid movement of still images, and Michael Faraday carried out investigations in the same area. Then in 1832, Dr. Joseph Antoine Ferdinand Plateau in Belgium and Dr. Simon Ritter von Stampfer in Austria simultaneously brought out devices for viewing pictures in simulated motion, the first "motion picture machines." Improved models of these devices were developed by Baron Franz von Uchatius in Austria, and William George Horner in England.

The pictures used in these machines were drawings. The next great step was the development of photography, which began with the publication of the work of Louis Jacques Mandé Daguerre in France in 1839. The first man known to have used a series of photographs to produce an illusion of movement was Coleman Sellers of Philadelphia, Pa., in 1860. By 1864 Louis Arthur Ducos du Hauron, in France, had set down on paper a substantially complete blueprint of the motion picture as we know it, and in 1870, again in Philadelphia, the first actual projection of a photographic motion picture on a screen was shown by Henry Renno Heyl.

Seven years later, in California, John D. Isaacs, an engineer retained by former governor Leland Stanford, used a battery of cameras to

record the phases of motion of a running horse. It was an effective application of snapshot photography to the analysis of motion. The operator of his mechanism was Eadweard Muybridge, a local photographer who had made a previous unsuccessful effort. Muybridge became famous as a photographer, but Isaacs went back to his profession and became chief engineer of the great Harriman railway system. The pictures from California were synthesized into bits of motion in Europe by means of existing mechanisms.

Edison's Contribution.—The great step from the laboratory to the world of everyday application was nearing. In 1887 Thomas A. Edison set himself the task of doing for the eye what his phonograph was already doing for the ear. He arrived at a mechanism but lacked an adequate carrier to feed it with pictorial images. That arrived when George Eastman of Rochester brought forth a new material for the "roller photography" of his Kodak. It was film. Edison got a sample about an inch wide and 50 feet long, for \$1.50. In a few weeks his peep-show Kinetoscope, the ancestor of all motion picture mechanisms, was complete and demonstrated in his laboratory. The date was Oct. 6, 1889.

Edison was little impressed. He put the machine in a corner of his library office, and there it stood gathering dust. In 1891 Thomas R. Lombard, a promoter, won Edison's consent to make a battery of ten peep-show machines for exhibition at the Columbian Exposition in Chicago, scheduled for 1892. The fair was a year late, but the Kinetoscopes did not arrive even in 1893. Edison did not care much. He had let his lawyers patent the machine in the United States in 1891. But he refused to spend \$150 to patent it abroad. Many historic consequences and sundry piracies grew out of that in years ahead.

At last the Kinetoscope Parlor, with Edison's ten machines, depicting bits of prize fights and fragments of vaudeville acts, was opened at 1155 Broadway in New York City, April 14, 1894. Within months the peep-show Kinetoscope became a leading attraction in the dime-museum and penny-arcade field of showmanship. One such exhibit showing *Dolorita in the Passion Dance*, imported first for the midway of the Chicago fair, brought the films' first touch of censorship when a showing on the boardwalk in Atlantic City, N. J., was suppressed by the police.

Pressure rose rapidly in the trade for a union of the Kinetoscope with the magic lantern. One customer at a time could peer into the Kinetoscope. A magic-lantern exhibition would increase receipts and speed the turnover by entertaining a roomful of spectators simultaneously. Edison's sales department was reluctant, fearing to exhaust the novelty market. Edison himself, no entertainer, was indifferent. Concurrently, however, attempts to duplicate Edison's machine, which lacked the protection of foreign patents, had spread around the world. In the United States, Thomas Armat, of Washington, D.C., a scientifically minded real estate investor, contrived a competent projector known as the Vitascope, using Edison films, which he presented in September 1895 at the Cotton States Exposition in Atlanta, Ga. The showing made no great impression at the time, but it had a highly successful future in store for it.

In France, Louis Lumière, a photographic manufacturer, found the Kinetoscope on display in Paris and set about projection. In England

Boston scientist with wide industrial and academic experience, had founded the Technicolor Motion Picture Corporation to pursue researches that he and some associates had initiated. They first pursued the two-color, color-in-the-film method. In 1922 Technicolor appeared on Broadway with *The Toll of the Sea*. The greatest milestone was reached 11 years later with a demonstration three-reel comedy *La Cucaracha* made in a full three-color process. Substantially natural color in complete spectrum had arrived. Technicolor thenceforth developed with a rapidly rising curve, and soon dominated major production, both at home and abroad.

Sound.—While color was becoming firmly established, the more revolutionary feature of sound arrived, bringing recorded music and speech to the screen. Edison had essayed a combination of picture and phonograph in the peep-show period, and about 1912 he had ineffectually presented projection synchronized with the phonograph. But the problem of amplifying the sound sufficiently to fill an auditorium was as yet unsolved.

Explorations in the realm of sound by the Bell Telephone Laboratories in the mid-1920's resulted in a super-phonograph, with electrical recording and amplification of sound, leading to the Vitaphone, synchronized disc and film. It was first presented to the motion picture public by Warner Brothers, entrepreneurs up from the nickelodeon, in a showing of *Don Juan* with John Barrymore in New York, Aug. 6, 1926. The disc recording method soon gave way to sound on film, a method of translating sound waves into electric impulses controlling light impingement on the "sound strip" of the films. It was powered by the photoelectric cell and radio tubes which amplified the sound as the projector amplified the visual image. The Bell Telephone or Western Electric method depended on variation in density, while the rival General Electric system, promoted through the Radio Corporation of America, used a variable area track. The patents were soon pooled and rivalry between the two methods ended. The era of the "talkies" had begun, and the silent picture was driven precipitously from the screen.

By 1953 motion picture technology was making wide use of processes of sound recording on tracks and tapes of magnetized material, and experiments were also being made in the magnetic recording of pictorial images.

Censorship and Government Regulation.

—The acquisition of sound by 1928 had sent motion picture production in quest of words to say, which meant turning to the stage. The rise of feature pictures had driven the stage off "the road" and back to metropolitan audiences, especially in New York. As a result the stage had become sophisticated, and the movies, in acquiring stage material, came upon difficulties with their much larger public. Local censorships tightened and national censorship was threatened.

To meet the situation, Martin Quigley, trade journal publisher and eminent Catholic layman, conceived and fostered the Production Code which was adopted by the industry under public relations duress on March 31, 1930, and then quickly forgotten. More protests arose, mainly from church sources. A boycott of the screen was ordered in Philadelphia by Denis Cardinal Dougherty. It cost exhibitors about \$200,000 a week at the box office. In November 1933, the Cath-

olic Legion of Decency, whose members pledged to abstain from attending immoral movies, was formed. The motion picture industry, through the dominant trade association, the Motion Picture Producers and Distributors of America, otherwise known as the Hays office, made promises and organized the Production Code Administration to police the product at the source in Hollywood. The code, which was simple and nonsectarian, started functioning officially in July 1934, under the administration of Joseph I. Breen, one-time member of the Quigley staff. The industry was glad to settle for that and found in the code, as an instrument of self-regulation, a foil for the external censorship movement.

The Production Code has remained unchanged since its first formulation. It has sometimes been administered strictly, sometimes with considerable elasticity, but on the whole to the satisfaction of the groups which originally demanded reform. Through the years many complaints have been heard, both within and without the industry, that the code straitjackets the art; that it makes difficult or impossible criticism of the cloth, the bench, the armed services, or the social, economic, and moral status quo; and that it is in effect a worse evil than the legal censorship it was formulated to combat. But no effective public support for such criticism has ever emerged.

There is a long history of censorship. Chicago by city ordinance established censorship under police administration on Nov. 4, 1907. In the same period the movies were under serious attack in New York City and film theaters were ordered closed by Mayor George C. McClellan, Dec. 24, 1908. The People's Institute, supported by the Patents Company, went to the rescue in 1909 with the formation of the National Board of Censorship, renamed the National Board of Review of Motion Pictures in 1915. For a while its findings were enacted into law by some states and communities, but ultimately its legal and social functions were substantially assimilated by the motion pictures' major trade association. The National Board, however, continued to function and publish a magazine, *Films in Review*.

State censorship started in Pennsylvania in 1911, and in various fashions, half a dozen states continue to censor the movies; but in the main, censorship has not been a large influence on the art and industry of the screen.

The Production Code's initial period overlapped with the era of economic revolution which came in with the New Deal and the years of the big depression. Hearings were held in Washington under the NRA leading to the formulation of a Code of Fair Competition, approved by President Franklin D. Roosevelt on Nov. 27, 1933. A code organization was set up by the industry, but it was dissolved when the Supreme Court ruled against the NRA not long after. The next major move came from the Department of Justice, which filed a great antitrust suit in New York against the major concerns in the production-distribution and exhibition fields on July 20, 1938 (*United States vs. Paramount Pictures, Inc. et al.*). Specifically, the companies were accused of dominating exhibition through a virtual monopoly ownership of key "first-run" theaters, and of acting in collusion to exploit this advantage.

The case emerged from the United States Supreme Court with a decision against the defend-

ants, May 3, 1948. The suit was remanded to a lower court for action on monopoly practices and divestiture of illegally held theaters. One by one the defendants signed elaborate consent decrees, ending at last in the Loew, Inc., decree of Feb. 7, 1952.

Financial Problems and New Techniques.

The movies, after struggling through the depression years and the expensive development of the sound film medium, as well as the discouragements of the NRA regulation campaign, moved into prosperity again in 1935 and continued to flourish through the earlier years of antitrust disturbance. The trend was upward, but in terms of inflated dollars.

Through the era of swollen payrolls during World War II the films especially prospered. Wartime restrictions on luxury merchandise, motor cars, and gadgets funneled money into the movie box offices. The character of the curve is indicated by two reference points: according to Department of Commerce figures, theater receipts in 1941 were \$756,000,000; in 1946 they reached an all-time high of \$1,512,000,000, exactly double the earlier figure.

Then came television, released from war controls, and the movie curve began bending downward at an increasing pace. In 1951, at the end of a decade of tall figures, the box office take was \$1,166,000,000. According to Bureau of Labor statistics evaluations, those 1951 dollars were worth only \$662,754,400 in relation to 1941, a loss for the decade of about 11 per cent.

The movies' first defense move was theater-screen television by coaxial cable, which developed spottily. Concurrently a campaign was conducted to induce the Federal Communications Commission to allot space for theater television in the upper ranges of the broadcast spectrum, but without success.

From 1946 to 1952 about 5,000 United States film theaters closed. About 3,000 outdoor or drive-in theaters opened along the highways to intercept the growing motoring public. Literally thousands of lesser theaters, including drive-ins, kept solvent only by the sale of confectionery, popcorn, and the like.

Despite all disclaimers the most immediate problem was to meet television competition. There was a vast stirring of interest when Cinemascope, which had been years on the way in the laboratory, arrived with an opening at the Broadway Theatre in New York City, Sept. 30, 1952. It involved the use of three cameras and three projectors filling a tremendous concave screen. The great curved screen, tending to enclose the audience, gave an illusion of stereoscopy attributed to peripheral vision across the wide optical angle of 142°. Individual theater equipment costs were about \$100,000. Cinemascope seemed and was in fact not directly relevant to the patterns of the narrative art of the drama; it began as sheer spectacle. But in terms of screen geometry, Cinemascope made home television screens seem as puny as tintypes. (See also CINERAMA.)

Meanwhile stereoscopic experiments and explorations aimed at putting three-dimensional illusion on the screen, by various devices of separately recording right- and left-eye images, had also been on the way for many years. A plastic material known as Polaroid with a capacity for plane-polarizing light had been brought forth two decades earlier, and it provided a facile method of presenting stereoscopic pictures which,

however, required Polaroid spectacles for viewing. This technique was demonstrated in an industrial picture produced by John A. Norling, cinematographic expert, at the New York World's Fair (1939-1940). It was effective, but the industry was unmoved. Meanwhile other kindred processes were evolved but drew little attention. Then, in 1952, one of the Polaroid three-dimensional processes, trade-named Natural Vision, presented an otherwise unimpressive picture of African atmosphere entitled *Bwana Devil*, at a Hollywood theater, Nov. 27, 1952. Though received with critical hostility, it drew remarkable public attention.

Local public acceptance sent the initially skeptical movie makers in pursuit of various stereoscopic processes, nearly all derivatives of the Polaroid technique. Inevitably also they looked for new applications of the wide-screen Cinemascope.

Most conspicuous of the wide-screen methods was announced by Twentieth Century-Fox Film Corporation in Hollywood, under a succession of names becoming eventually Cinemascope. It was an optical invention, originated years before in France, for recording the motion picture in a distorted negative image, crowded into a single 35 millimeter film, which in turn expanded to normal width on the theater screen. It was the most ambitious of all the new screen techniques. Early in 1953 it achieved trade demonstration, and its sponsors made an investment of about \$4,000,000 in a Cinemascope version of the religious novel *The Robe* which had been in inventory for a decade. In six months, Cinemascope had become by far the dominant new technique. (See also CINEMASCOPE.)

TERRY RAMSAYE.

THE ART OF THE MOVING PICTURE

The film medium, "child of the laboratory and the machine," was not regarded at the time of its invention as a potential art form but as a mechanical means of reproducing works of art in the traditional media, especially the stage. Thomas A. Edison, who devised moving pictures as a complement to his phonograph, saw no further into the future of his invention than that. The ability of the film to copy the stage cheaply and disseminate copies widely and in great numbers was early apprehended, and in 1907 a company called the Film d'Art was founded in France, designed to record the performances of the Comédie Française and other eminent troupes. Joseph Jefferson, Sarah Bernhardt, Benoit Constant Coquelin, Jean Mounet-Sully, Mme. Réjane (Gabrielle Charlotte Réju), and Eleanora Duse acted for the early cameras, and Bernhardt heads the list of those who believed that the film was to be "my one chance of immortality." But, ironically, the preservation of these records has weakened reputations which might have taken their places beside the legends of Edwin Thomas Booth and Sarah Siddons. Lacking the voice, these literal photographs preserve, not the glamour of Bernhardt or the art of Duse, but the thin shadow of extinct celebrity.

This was dimly perceived even at the time. Contemporary opinion still held, what Marcel Pagnol believed as late as 1930, that "the cinema is destined to be a printing press for the drama." But the actual makers of early films—obscure, unlettered men mostly, not bound by aesthetic tradition—soon found that to make, without

sound, a faithful record of a stage performance at proscenium distance from the action, resulted in nothing that would move an audience. Pre-eminently led by David Wark Griffith, they experimented toward the development of a purely visual narrative technique. They began to move the camera in close for intimate scenes and to draw it back for broad effects; to begin and end scenes in the middle of the action; and to interrupt a scene in order to introduce complementary or contrasting events occurring at a distance or at another time. A host of camera tricks, many of them discovered before 1900, were by 1912 being used as dramatic devices—the “fade,” the “dissolve,” “slow-motion,” “stop-motion.” Most important, the film makers, also by 1912, had begun to realize that they did not really “make” their films until the moment arrived when they composed all these lengths of film, taken at different times and places and at varying distances from the action, into a unified and shapely whole.

D. W. Griffith.—Since the devices described above include all the essential features of the art of the moving picture, it can be said that the elements of the art were formulated in the first decade and a half of the 20th century—but formulated in the unknown studios and shown in the shunned darkness of the nickelodeons. What was happening burst upon world consciousness with the release in 1915 of D. W. Griffith's *The Birth of a Nation*. Many factors contributed to the extraordinary success of this film, but one of its leading accomplishments was certainly the fact that it convinced the educated classes that the motion picture was not, as they had thought, merely a mechanical copy of the stage but a new, unexplored medium. With few resemblances to the theater, with some to the episodic novel, but with strong affinities to musical structure, the form of this film deeply impressed its public. Gilbert Seldes said of it, “*The Birth of a Nation* is a single picture, a unit, just as a symphony is a unit, the parts growing out of each other, growing greater because of their relation to each other . . . A dominant tone is given to the entire picture, and the subsidiary episodes are played in related keys. The cutting is perfectly done, so that interest is always kept in an episode for itself, then dispersed or concentrated elsewhere, to return to the first episode for its relation to all the others: it is cinematic counterpoint.” The use of musical terms is significant. Through this film it became apparent that what—The act of the moving picture might be, it was a motion picture. Griffith had not only directed which meant that cinematography of *The Birth of a Nation* feature pictures pieced it together himself in the road” and back to “ad actually invented it. Especially in New York, he took from two novels, but become sophisticated, a script, arranging and acting stage material, as to each other and to the their much larger plot. (Griffith rehearsed tightened and national c their entirety before they To meet the situation, these rehearsals con-journal publisher and editing” of his films; he conceived and fostered the independently, used any was adopted by the industry, clear from his example tions duress on March 31, intelligence in the mak-forgotten. More protests, director, who is not church sources. A boycott ctors, as on the stage, dered in Philadelphia by ell. gherty. It cost exhibitors a he *Birth of a Nation* at the box office. In November its release. That no

one knew how to describe it at the time is evidenced by the newspaper critics' use of such terms as “display” and “spectacle,” obviously without being satisfied with any of them. To their assistance came a group of poets, critics, scholars, and journalists who, it suddenly appeared, had been haunting the despised nickelodeons for years. Elie Faure had published *The Art of Cineplastics* in 1912 and (Nicholas) Vachel Lindsay *The Art of the Moving Picture* in 1915. These eminent intellectuals were infatuated with the possibilities of what had been considered a plebeian, if not a pariah, medium. They were also aware that neither they nor any of their contemporaries had yet plucked out the heart of its mystery. They were not content with Faure's noun “cineplastics” nor with the National Board of Review's adjective “cin-graphic.” They cautiously ventured that the medium of the moving picture appeared to be light and that its form seemed to derive from the rhythm of the varying speeds at which individual shots were passed across the screen. For the moment they said no more, but watched the rapidly developing medium for signs and portents. Meanwhile—joined in America by Seldes, in England by Iris Barry, in France by Guillaume Apollinaire—this first group of film aesthetes defended the popular art from superficial criticism: that it was vulgar, that it was mass-produced and produced for the masses, that it was machine-made. They found its vulgarity vital. They saw in the peculiar relation between the popular film and its vast audience a recrudescence of the folk art of the Middle Ages. They rejected the notion that the film was too mechanical and commercial. “Films are made by men, not machines or corporations,” was the answer of Iris Barry to such critics.

The German School.—There matters rested until the appearance in 1919 of *The Cabinet of Dr. Caligari*. This famous film with its painted backdrops was redolent of the traditional arts and of art itself, and its striking use of light and shade gave credence to the belief that the film in its essential nature was a “light-play” (the German word for movie became *Lichtspiel*). Indeed, might not films be considered to be “painting in motion?” The time was ripe to think so. Léopold Survage had designed a “motion painting” as early as 1913, and cubist painters longed to add the dimension of time to their designs. In Germany and in France in the early 1920's, a film *avant-garde* sprang up composed of Hans Richter, Viking Eggeling, Francis Picabia, Fernand Léger, Man Ray, and others. Dadaist, cubist, abstract, surrealist films poured forth profusely for a while. Cheaply and obscurely made, unseen by the mass audience, they exerted little influence on professional film making but greatly affected the attitude of European and American intellectuals toward the film medium. Because they mirrored the ferment then boiling in the older arts, they had the double advantage of seeming modern while remaining comfortably traditional, inasmuch as they derived from well-known cultural movements. These films and the men who made them were leading the medium toward one of its two possible extremes: the “animated” picture, a closed world of its own. Such a film is a design recorded exactly as imagined and executed by its creator. This conception was entirely agreeable to the taste and experience of the painters who

MOVING PICTURES

Above: The successful English adaptation of Shakespeare's *Henry V* appeared in 1945. Sir Laurence Olivier produced and directed the film and played the title role.

Below: Under Fred Zinneman's direction, the Western *High Noon* achieved a peak of dramatic tension. The film was produced by Stanley Kramer in 1952, with Gary Cooper in the leading role.

instituted this first cinematic "School of Paris," it is to most of their descendants, the present-day film *avant-gardists* in the United States and Europe. But it seemed to leave something out of account, specifically the basic craft of film, *montage* itself, which in this context is referred to the mechanical recording function it had earlier when people thought the film was properly a copy of the stage. But photography, as a medium, appears to make demands and have finities of its own, which will be referred to below.

The influence of *Caligari* also led to another world, the much admired world of the German studio films of the 1920's. It was a world from which reality was rigorously excluded, but in which the aspect of reality was produced with a minute fidelity and skill at which film makers elsewhere marveled. The master spirit of this world was Carl Mayer, a screen writer who had never written in any other medium and the author of a long succession of famous films, beginning with *Caligari* and including *New Year's Eve*, *The Last Laugh*, and *Artifice*. Mayer dominated the films he wrote. His aim was unity of time, place, and action to heighten intensity; he pursued it by constructing the studio vast sets through which the camera continually moved, and even flew. The moving camera, invented at least as early as 1914, had been used only occasionally. Now, Mayer discarded the American editing system with its piecemeal assembly of many shots taken from different angles, and substituted a new, centralized and unified structure in which "cuts" were few, "takes" long, and the moving camera itself the principal stylistic feature. The result was a screen world which, like the films of the *avant-gardists*, approached "animated painting."

The American film industry, deeply impressed by German studio craftsmanship, used the moving camera to excess after 1927, and imported to Hollywood the directors Ernst Lubitsch and F. W. Murnau, the producer Erich Pommer, Carl Mayer himself, and others. They introduced certain sophistication of content into American films, and one American director, Josef von Sternberg, showed himself heavily under the German influence in his use of light and of the moving camera. But for the most part leading directors of the silent period (Henry King, Herbert Brenon, John S. Robertson, King Vidor, John Ford) continued and refined the existing tradition established by Griffith.

Chaplin and Others.—After Griffith, the leading creative spirit in the American film was Charles Chaplin. Known to and loved by more human beings than any other entertainer in history, he speedily achieved the capital power to produce his own films as he liked, being at once author, director, and editor as well as star. His drama *A Woman of Paris* (1923), which he wrote and directed but in which he appeared only briefly, showed his mastery of all the means of cinema, but the majority of his films, centering around the figure of "Charlie," deliberately utilize only a small segment of the total area of cinematographic means. In these films the camera is used almost solely to isolate and observe the movements and gestures of a single figure. Since Chaplin alone among film artists has controlled his own films from nearly the beginning of his career to its mature stage, it is possible to follow not only his technical and stylistic

development but also the evolution of his viewpoint, from an early brutality and sentimentality through indignant social criticism to a Sophoclean irony and serenity.

Mack Sennett, Chaplin's mentor, also fathered a vein of screen comedy which used movie magic to further slapstick, and which at its best rose to irony and satire, and even to metaphysics. His principal disciples were Buster Keaton, "Fatty" Arbuckle, Harry Langdon, and Harold Lloyd, with W. C. Fields, the Marx Brothers, and Bing Crosby and Bob Hope as latter-day descendants. The enduring quality of many of their films, especially Keaton's, emphasizes how often the best screen work has come from popular entertainers unconscious of any mission other than to please, rather than from those who sought to uplift the movies or to use them as a belt line for the transmission of aesthetic values originating elsewhere.

Chaplin and Griffith aside, the only American director to approach complete control over the form and content of his films was Erich von Stroheim, though his attempts to achieve autonomy against the grain of the industry's organization eventually cost him his position as a leading director. Analyzing and then reassembling the visual elements of his films into a mosaic of detail, he strove to confer on the film the scope and psychological penetration of the novel; two of his films, the famous *Greed* (1924) and *The Wedding March* (1928), were completed in more than 40 reels. Such extravagance (more of running time than of production cost) caused his employers to remove him from control and to cut down the films to normal length. Even in this fragmentary form, these films are numbered among the masterworks of the medium.

Montage.—Rhythm, which the pioneer aesthetes had declared to be the basis of film form, was for many years neglected in film theory (though not in practice) in every film-making country except the Soviet Union. There, under state control and for political reasons, theories and experiments likely to result in more effective films were long encouraged, and a young generation of film makers set out to understand and master the medium. Sergei Mikhailovitch Eisenstein and Vsevolod Illarionovich Pudovkin in particular studied the films of all the world, but especially American films and most intensively the films of D. W. Griffith. From their study and resulting practice emerged the first fully reasoned aesthetic theory of the film medium.

They derived it principally from Griffith's *Intolerance* (1916), which Terry Ramsaye called "the only film fugue." *Intolerance* simultaneously told four stories from four different historic epochs, cutting from one to another as the progress of each demanded, and culminating in a quadruple climax in which "history itself seems to pour like a cataract across the screen." This was indeed "cinematic counterpoint," the most advanced example yet known, and too advanced for the public of 1916. Its specific revelation to the Soviet cinematographers was that the film director, as editor, could be a master juggler of time and space, juxtaposing any or all of the elements of the visible universe to produce contrast, comparison, or parallel as demanded by the theme. Pudovkin wrote, "Editing is the creative force of filmic reality," and he and his colleagues set to work to outline as precisely as possible the theory of montage.

Montage theory (the selection, cutting, and piecing together as a consecutive whole of the separate shots taken in the making of a film) asserts that everything recorded on film is but raw material for editing. Human beings are required to "behave" rather than to "act" for the camera, and are chosen rather for physical appearance than for professional skill (the "theory of typage"); their performances are actually the creation of the director-editor. All material is shot looking forward to the cutting bench, and there the creative act of film making takes place. In editing, the shots are joined together in a manner determined not by their content or narrative value, but according to a preconceived editorial pattern designed to achieve rhythmic effect. Such effects are to be secured "metrically"; sequences composed of very short shots will produce excitement or suspense; a succession of long-held shots will yield a mood of melancholy or repose; the two rhythms may also be alternated or modified to any desired degree. Montage theory holds that the assault of these measured rhythms upon human reflexes produces emotional and intellectual reactions almost independently of content.

The first fruit of the montage theory was S. M. Eisenstein's *Armored Cruiser Potemkin* (1925), with its famous Odessa steps massacre, a sequence which seemed final proof of all the assertions made about montage. After Carl Mayer saw *Potemkin*, he concluded that the German studio style he had labored to create was a blind alley, a misguided attempt to synthesize theater and painting, and that this "inspired newsreel," as *Potemkin* was often called, held the key to the future of the medium. His response was widely shared. Georg Wilhelm Pabst, who dominated the German film in the second half of the 1920's, based *The Joyless Street* (1925) and *The Love of Jeanne Ney* (1927) on montage. Film enthusiasts throughout the world saw montage as the organization and rationalization of those purely cinematic qualities which had been dimly perceived in the earlier work of Griffith and von Stroheim. The arrival in western Europe and the United States of further Soviet films—Eisenstein's *Ten Days That Shook the World* (1928), Pudovkin's *Mother* (1926), and *The End of St. Petersburg* (1927), Alexander Dovzhenko's *Arsenal* (1929)—seemed to confirm the hypothesis that montage could tell any story, dramatize any theme. The basis of film form was thought to be established.

Sound.—At this juncture the sound film arrived. Since at the beginning it was impossible either to move the camera or to edit the sound track with any freedom, the film returned to its ancient bondage to the theater and simply photographed innumerable stage plays. The art of the moving picture as an independent and unique medium seemed lost. But in 1928, before they had themselves seen a talking picture, Eisenstein and Pudovkin in a famous "manifesto" predicted that montage would apply to the sound film exactly as it had to the silent. Once the sound track could be cut (as soon it could be), dialogue, music, and "natural" sound were to be recorded and edited in counterpoint to one another as well as to the visual sequences. Sound would not reflect the visual image, nor need it have a visible source; its use would be determined thematically.

Even before it appeared, the principles enun-

ciated in this manifesto were being applied in virtually every film-making country by veteran directors who refused to abandon the hard-won flexibility of the film and return to stage methods. King Vidor's *Hallelujah!* (1929) restored mobility to the camera and conferred it upon the microphone. Josef von Sternberg's *Morocco* (1930) reduced dialogue to a subsidiary narrative function. Particularly, the work of René Clair in *Sous les Toits de Paris* (1930), *Le Million* (1930), and *A Nous la Liberté* (1931) brilliantly revealed the potentialities of sound-image counterpoint. Since the early days of sound, complex audio-visual editing patterns have been achieved by directors working all over the world—in Lewis Milestone's *All Quiet on the Western Front* (1930), Pabst's *Kameradschaft* (1931), Fritz Lang's *M* (1932), and *Fury* (1936), Ernst Lubitsch's *The Man I Killed* (1932), John Ford's *Young Mr. Lincoln* (1939) and *The Grapes of Wrath* (1940), Frank Capra's *American Madness* (1932) and *Mr. Deeds Goes to Town* (1936), Julien Duvivier's *Poil de Carotte* (1932), Carl Theodor Dreyer's *Day of Wrath* (1944), Vincente Minelli's *The Clock* (1945), John Huston's *The Maltese Falcon* (1941) and *The Treasure of the Sierra Madre* (1947), and Fred Zinnemann's *High Noon* (1951). Since World War II the "neorealist" Italian film school has demonstrated mastery of all the discoveries of the pioneers of silence and sound in the world-famous productions *Open City* (1945), by Roberto Rossellini, and *Bicycle Thief* (1949), by Vittorio de Sica, as did the Japanese *Rashomon* (1951), directed by Akira Kurosawa.

If the progress of film experiment, investigation, and theory has been more arduous in the 25 years since the coming of sound than in the preceding quarter century, there have been various reasons. Dialogue films must be produced from a detailed script. This enables complete studio control over the work of the director on the set and in the cutting room, and leaves little freedom for improvisation. Sound also introduced as a dominant member of the production team the professional writer, whose experience lay only in literary creation. He tended to make dialogue the chief expressive factor, at the expense of photographic and structural considerations. This trend in recent years has somewhat reversed itself as writers such as Nunnally Johnson and Charles Brackett have themselves become directors or producers. Many other factors have entered into a seeming diminution of the "film sense" in both film makers and film enthusiasts. In the Soviet Union, montage, in spite of its evident resemblance in some respects to the Marxist theory of dialectics, was rejected as "too intellectual" at a Soviet cinematographic congress in 1935 which followed by a few months the writers' congress at which "Socialist realism" was proclaimed as the future governing principle of all art in the USSR. Socialist realism in Soviet film practice meant a wholesale return to the methods of the theater. Eisenstein and Pudovkin began directing stogy and even operatic films, and Eisenstein in his published writings systematically amended his early theories of montage in the hope of discovering hidden resemblances between the editing principle of film and the structural characteristics of the novel, poetry, and painting. The impulse to discover such resemblances has indeed dominated much of cinematic cerebration since the advent of

ound, as the impulse to explore and isolate the unique properties of the medium was paramount in the preceding era. In part this derives from the long-lived persistence of the genteel tradition, especially in the United States. French films of the 1930's were largely theatrical in style, as were British films of a later date, and these uneasy compromises between stage and screen won the approbation of the educated classes, more so perhaps in the United States than in Europe. While it is possible to produce evidence that Bing Crosby's and Bob Hope's *The Road to Zanzibar* (1941) is aesthetically superior to Raimu's *The Baker's Wife* (1938), the point little impresses a public more interested in "mature content" than in formal aesthetics, and in any case unable to associate aesthetics with the popular commercial product. The "art house" audience apparently prefers filmed Shakespeare and films about painting and music—films "about," rather than films as such. As against this, there is a considerable and growing non-theatrical audience, mostly young, organized into film societies, which reveres the primitives and classics of the art and probes their cinematic qualities with almost academic zeal.

Finally, the introduction of the wide screen, like all previous mechanical additions to the art with the exception of color, has temporarily thrown the moving picture back once more into the shadow of the stage. Since on the wide screen the eye must be led from one point of interest to the next, the temptation is great to lead it by the plotting of "business," as in the theater. Stylized backgrounds as in *Caligari*, the moving camera, and long takes with few cuts have also been revived. There are signs that this relapse may be as short-lived as that which attended sound.

Reference has been made to the "animated" picture as one extreme of cinematography's spectrum. No second artist of the stature and popularity of Walt Disney has yet appeared in this field. The other extreme of cinema's possibilities lies in the recording of unrehearsed events by the camera. One school of theory, adhered to by many photographers, holds that photography in its still largely unknown nature "likes" the actual rather than the arranged; that any art so completely based on photography as cinema must take this into account; and that the cinema at its purest is therefore in very large part an art of observation. The leading exponent of this conception of the motion picture was Robert Flaherty. As compared with the editing principle and the sound track, little experiment with moving photography has yet been carried out. What work has so far been done has occurred largely in the field of documentary moving pictures.

RICHARD GRIFFITH.

DOCUMENTARY MOVING PICTURES

The documentary film deals with facts and seeks to provide the spectator with information. This "film of fact" records historic and newsworthy events; preserves the customs, manners, and appearances of societies; explains and teaches scientific discoveries; and expresses controversial opinions—private and public.

Beginnings.—The earliest motion pictures made in France and England from 1895 were pictorial journalism. Itinerant photographers captured exotic scenes, and these fact films were

eagerly sought after by audiences at home. In time the photographers recorded news events with a degree of regularity; these films came to be known as newsreels (*actualités*), and were first produced commercially in 1909 by Charles Pathé and Léon Franconi, in France and the United States. Previously, the Edison Company had photographed President William McKinley's inauguration in 1896. In the next few years cameramen shot miscellaneous footage in millions of feet covering such subjects as the Jeffries-Corbett prizefight, an Easter parade on Fifth Avenue, New York, the San Francisco, California, earthquake and fire, the first flight by Wilbur Wright in France, Theodore Roosevelt, and some of the exploits of Harry Houdini.

When the narrative film became the feature of the theater program, the fact film was relegated to the single reel, or to semifactual and factual features, in some of which history was re-created as well as recorded. One such short fact film was *The Horse in Action*, produced by the Pathé Company around 1911. Still a remarkable work, the film demonstrated the movements of the horse at normal and at one eighth of normal speed. An American group a little later documented the life of a typical family of Blackfoot Indians in Montana, and the communal life of birds that nested on an isolated island off the South African coast.

By 1922, the young Soviet Union had developed a powerful propaganda arm through the use of documentary film called Kino-Eye. Directed and edited by Dziga Vertov, Kino-Eye applied the peculiar resources of the cinema to develop an international film language capable of recording social and political events, and expressing approximate sensory experiences to give spectators a sense of actuality.

The Work of Robert J. Flaherty.—Robert J. Flaherty (1884–1951), an American-born and Canadian-trained mineralogical explorer, is identified as "the father of the documentary film." From 1910 to 1920, Flaherty led expeditions into the sub-Arctic regions of eastern Canada. Not satisfied simply to record his experiences of life among the Eskimos on photographs, Flaherty learned the technique of motion pictures in order that he might return to Hudson Bay and make a full film on the life of an Eskimo family. The fur merchants, Revillon Frères, whose trading posts dotted the north country, gave him financial support on condition that the completed film carry their name as its sponsor. Thus was the first sponsored documentary film born. *Nanook of the North* (1920–1921) was a saga of a primitive people's fight for existence against the pitiless weather of the sub-Arctic.

In Samoa in 1926, Flaherty produced *Moana*, recording the ritualistic practice of the tattoo and other features of island life. Subsequently, in a short unhappy association with Fred W. Murnau, a renowned German director, Flaherty participated in producing a commercially distorted motion picture of a South Sea idyl, *Tabu* (1930). In 1933–1934 Flaherty went to a rocky island off the Irish coast where he beautifully dramatized the eternal conflict of man against the sea in *Man of Aran*. After a visit to India where he produced another commercial film, *Elephant Boy* (1937), a cinematic retreat from the uncompromising standards he had previously set for himself, Flaherty entered the service of the United States Department of Agriculture

(1939-1942) for which he directed *The Land*, a study of soil erosion and the dislocation of farmers by the machine. After World War II Flaherty obtained funds from the Standard Oil Company to make a romanticized feature documentary on the life of the people of the Louisiana bayou country, *Louisiana Story* (1948).

In the 1920's, films of realism were being produced all over Europe. In France, Alberto Cavalcanti caught the essential quality of metropolitan life in his film on Paris called *Rien que les heures*; others, Jean Painlevé and Jean Benoit-Lévy, for example, produced brilliant educational and nature shorts totaling hundreds of titles. Walther Ruttmann composed another "city symphony" in *Berlin* (1927), in which the actuality of city life, the contrasts of rich and poor, took on the drama of fiction.

Joris Ivens and Others.—In Joris Ivens, the world documentary movement found powerful leadership. A free-lance global cameraman-director, his work from 1927, in his native Holland, showed strong social awareness. *The Bridge* (1927) was a simple, nondramatic portrait of a Rotterdam bridge. Another of his early films was *Rain* (1929), a sort of tone poem, in which he captured the quality of a short rainstorm in the city. Later, Ivens made films for a few industrial firms in Holland. In 1932 he went to the USSR where he produced *Komsomol*, a political film that searched for contrasts in the cultural life of German and Soviet youth. With Henri Storck, a Belgian collaborator, Ivens turned his camera on the *Borinage* (1933), depicting the misery of the miners with whom the artist Vincent van Gogh had spent some of his unhappy youth. Next he directed *New Earth* (1934), a story of the dyking of the Zuider Zee, and *The Spanish Earth* (1937), a deeply felt reportage of the Civil War in Spain as seen through the eyes of the common people. This latter film he made in association with the American novelist, Ernest Hemingway. In the years to 1950, Ivens made trips throughout the world to areas of social unrest—China, Indonesia, eastern Europe—recording current history and using the motion picture as a social weapon.

In Mexico, the distinguished American still photographer, Paul Strand, found financing and governmental support for producing a classic example of the documentary, *The Wave* (1934-1935). Magnificently photographed and brilliantly scored, this featurette related a tale of the economic exploitation and revolt of a village of poor fishermen.

In England, meanwhile, film makers, scientists, poets, and teachers organized themselves into a British documentary film movement. Under the leadership of an ex-minister and publicist, John Grierson, the group produced a hundred subjects delineating the England of the transitional 1930's. Supported by industrial sponsorship and government subsidy, technicians of the highest caliber were trained, and their work influenced the incipient fact-film productions of the United States, France, and Canada. Their films covered a wide range of subjects: the work of North Sea herring fishermen, a naval survey of the Labrador coast, the survival of English village handicrafts, the social implications of the British Broadcasting Corporation (BBC), the romance of the mails, and the Ceylon tea crop.

The New Deal Era.—Concurrently, an independent American school grew out of the federal government's spectacular use of the film to rally public support for its programs of reforestation, hydroelectric power development, scientific agriculture, and human rehabilitation in the 1930's.

Pare Lorentz, a former magazine critic, in two brilliantly expressive contributions produced the most impressive work of the early New Deal film era: *The Plow That Broke the Plains* (1936), documenting the waste and exploitation of the Great Plains area which, through the over-cultivation of wheat crops after World War I, had been transformed into a desert waste; and *The River* (1937), which warned of the reckless cultivation of cotton in the Mississippi River Valley, resulting in awful human and economic waste.

Out of these lyrical beginnings, Lorentz and others like Ralph Steiner, Willard van Dyke, and Alexander Hammid composed a whole series of celebrated sociological films under public and private subsidies. Probably the foremost of these latter-day essays, *The City* (1939), was a survey of community life in America, from the New England township of yesterday and the unplanned metropolis of today to the planned model city of tomorrow, decentralized and beautiful. Then came Van Dyke's *Valley Town* (1940), a view of technological unemployment in a Pennsylvania steel town; and Lorentz's *The Fight for Life* (1941), a compassionate study of poverty and the inadequate maternity care available to modern slum dwellers.

In Germany, the Nazi woman technician and ex-actress Leni Riefenstahl directed a spectacular series of pictures of the 1936 Olympic Games in Berlin. As the Germans prepared for war, Miss Riefenstahl prepared propaganda films of high brilliance to inspire their friends and terrorize their enemies: for instance, *The Triumph of the Will* (1934-1936), in which the Nazi Party functionaries were introduced to the German people; and *The Baptism of Fire* (1940), an account, of doubtful veracity, of the Nazi conquest of Poland, several versions of which were prepared and shown to officials of other governments to impress them with the irresistible might of Hitler's legions and the folly of opposing the Teutonic "wave of the future."

World War II.—A stream of documentaries flashed on the screens of the Allies from 1940 throughout World War II. Britain, under direct air attack, produced a group of outstanding films that related the human side of life during the blitz: *They Also Serve* (1940), concerning the courage of the average housewife in England; *Target for Tonight* (1941), a thrilling account of the defense of London in the blitz; and *Desert Victory* (1942-1943), a dramatic record of the British 8th Army's triumphant pursuit of Gen. Erwin Rommel's Afrika Korps across 1,300 miles of desert.

Col. Frank Capra, who had been a prominent Hollywood director, produced a series of imaginative and accurate counter-propaganda films for the United States War Department (1943-1945), realizing that good soldiers and citizens of a democracy must know and understand the nature of the enemy and the facts behind the conflict. From this premise films emerged with a most comprehensive grasp of the documentary idea, including *Prelude to War*, *The Nazis Strike*, *Divide and Conquer*, *The Battle of Brit-*

in. *The Battle of China, The Battle of Russia, and War Comes to America.*

As the war reached a conclusion, an Anglo-American group produced *The True Glory* (1945), an eloquent testimony to the Allied armies that fought the war side by side. The film recorded their voices and, in millions of feet photographed by combat cameramen of the United States, Canada, France, Great Britain, Czechoslovakia, Poland, Belgium, and the Netherlands, depicted their victories and heroism.

In 1943 the Soviets made available their coverage of *One Day of War*, in which hundreds of Russian cameramen photographed happenings in a single day along their far-flung war front. *The Story of Stalingrad* was released for exhibition abroad after the war.

Postwar Period.—Even before the death of President Franklin D. Roosevelt, the United States Congress canceled major film subsidies; the balance of production underwritten by the government during the Truman administration consisted largely of films whose purpose was to interpret American political and economic policy to nations participating in foreign-aid programs.

With the formation of the United Nations, film production was blueprinted into the plan for its international information services, first under the direction of the French film maker Jean Benoit-Lévy. Unquestionably, the most distinguished documentary sponsored by UNESCO, the U.N. agency, was the joint effort by the British craftsmen Paul Rotha and Basil Wright, *World Without End* (1952-1953). By depicting economic and social reforms effected by the UN in two depressed regions of Mexico and Thailand, the film helped to dispel the widespread opinion that the postwar fact film had fallen on dark days.

Devotees of the documentary organized an annual festival at Edinburgh, Scotland, shortly after the war, where controversy flared over the complacency of postwar film makers, dependent upon commercial sponsorship, and the plethora of purely expository productions. Such films were widely employed in the United States and Britain as extensions of industrial advertising programs, and they frequently lacked the inspiration and "divine discontent" of the work of earlier craftsmen like Grierson, Flaherty, and Lorentz.

However, two men had made their way to the forefront as outstanding contributors to the film document: the Englishman, Humphrey Jennings, who before his untimely death in 1950 had produced several remarkable, eclectic achievements such as the wartime studies *Listen to Britain* and *Diary for Timothy* and his final film, *Family Portrait*, commissioned by the Festival of Britain; and Arne Sucksdorff of Sweden, whose favorite theme of the conflict of good and evil in all living things was reflected first in short films like *People in the City* and *Divided World*, and then in the feature, *The Great Adventure* (1953).

The stunning, but short-lived, career of Italian "realist" films (in which nonprofessional actors dramatized their ordinary lives) had a strong counterpart in the United States (1954) with the making of a controversial, pro-labor feature, *Salt of the Earth*, performed mainly by members of the International Union of Mine, Mill and Smelter Workers in New Mexico. The film de-

picted an actual, violent strike against a zinc mining company that brought unity to Mexican-American and "anglo" miners and their women. Another picture with a factual flavor, Walter Wanger's *Riot in Cell Block 11*, was an offbeat Hollywood film that dealt with some deplorable aspects of American prison life, and employed real prisoners at California's Folsom State Prison as extras in mass riot scenes.

Continuing the admirable "living" biographies begun after World War II, French documentary people produced a series that by 1954 included Henri Matisse, Pablo Picasso, Georges Braque, André Gide, Colette, Paul Claudel, Arthur Honegger, and Albert Schweitzer. Documentary memorial films honored the film innovators, Louis Lumière and Georges Méliès.

JULES VICTOR SCHWERIN.

EDUCATIONAL FILMS

The tremendous potential of the film in education was appreciated by many of the pioneers in the development of the motion picture. However, the difficulties of handling the complex and heavy equipment and the fire hazard of 35mm. nitrate film kept films out of the schools until the development of the 16mm. size and its acceptance as standard for nontheatrical use in the period 1919-1923. A number of silent films made specifically for classroom use were produced in the 1920's, and the schools began to acquire 16mm. projectors. The visual education movement grew, finding enthusiastic approval from some educators, and opposition from others who feared the "mechanization of learning." The coming of sound in 1928 added a new dimension to 16mm. as well as theatrical motion pictures.

It was the Second World War, however, which helped audio-visual education to come of age. With thousands of men to be trained in new skills with a minimum expenditure in time and personnel, the armed forces turned to the 16mm. sound film and the filmstrip. New techniques and new equipment were developed. Immediately after the war, 16mm. production increased in volume and in quality, new producers joined the old ones, and in many classrooms the projector was accepted as a teaching tool like the blackboard. By 1953 more than 15,000 titles were in current distribution in the United States. Similarly, better understanding of the principles of audio-visual education and improved distribution have brought the motion picture to classrooms and informal gatherings all over the world.

Types of Educational Films.—Modern educational films use all the resources of motion picture photography and recording. Although there is still low-budget amateur production, chiefly for local use, most educational films today are produced by highly professional crews, with writers, cameramen, and editors trained in the special techniques of their field. Color is used frequently; music, sound effects, and synchronized dialogue are used as well as straight narration. All new developments in the motion picture field are scrutinized by the 16mm. producers with an eye to their possibilities in educational films. Both three-dimensional and wide-screen films are now possible in 16mm.; demonstrations were given in 1953, but the expense was still prohibitive.

The educational producer may choose from a wide variety of film types according to the needs

of his particular script. Documentary films show how people live and work in various parts of the world; a number of countries have made films about their own people to send abroad, and whole series of films showing typical families of many nations have been made for geography and social studies classes. The straight demonstration film, known as the "nuts and bolts" film, is used for training in skills. Dramatization is used effectively in historical re-enactments and human relations themes and has been particularly valuable in mental health subjects.

Animated charts, diagrams, and maps have been included in educational films from the earliest days, and their value in clarifying such subjects as the circulation of the blood or the operation of the internal combustion engine is obvious. Full animation, of the Walt Disney type, is less common because of the expense, but a number of animated and semianimated films have been made. New techniques developed for non-theatrical films have included the use of static material—paintings and drawings used under the animation camera to give the illusion of movement. Another type of film developed for 16mm. use is the discussion film, which presents a problem, or two sides of an issue, and leaves the audience to reach its own conclusions through discussion.

It would be a mistake to assume that educational films are used only in the schoolroom. Industry uses films in training technicians and salesmen, and to describe its activities to the public. Governments make films to attract tourists from abroad, and to show farmers or other special groups in their own countries better methods of working. Health organizations rely on films to demonstrate good nutrition and sanitation practices to adults with little formal education. UNESCO units use films in fundamental education in underdeveloped countries. Doctors study film records of complex operations in order to improve their own knowledge and skill. And small children eagerly welcome films shown at the public libraries as another form of storytelling.

Financing and Distribution.—Unlike theatrical motion pictures, educational films are not financed by paid admissions. The producer must either sell enough prints to schools, colleges, film libraries, and other film users to pay his production costs and enough over to make the venture profitable; or the production cost must be underwritten by a sponsor who wants a particular film produced. The nonsponsored film is sold much as a book is sold, except that the unit cost is higher. Most classroom films are nonsponsored, and the producer must make sure that he wins the approval of his customers—the teachers and audio-visual directors. The sponsored film may be paid for, and of course controlled, by a government, a foundation, an industrial corporation, or an educational institution. Such prints are generally loaned to film users without charge except for shipping. The films may range from straight advertising to such classics as *Nanook* or the *The River*.

In many countries educational films are controlled and distributed by a branch of the government, usually the ministry of education. Films are then made specifically for the requirements of the department. In the United States there is no government control of films, although many government departments have produced films at vari-

ous times. Most of the states have film libraries operated in connection with the state universities. In addition, many city school systems have their own film collections, as do some public libraries. Commercially operated film libraries also serve school and nonschool audiences. Religious denominations, labor unions, art galleries and museums, and many national and local organizations also have film collections for rental or loan.

While most films are distributed primarily in their country of origin, there is increasingly an international exchange of educational films. Great Britain, Canada, Australia, and the United States all use one another's productions, unhampered by language difficulties. Some western European countries have contributed to the exchange by re-recording sound tracks in several languages. India has made a large number of films, only a few of which have yet been seen in the United States. UNESCO is producing an international catalogue of film information and evaluation designed to help in sending educational films around the world.

EMILY S. JONES,
Executive Secretary, Educational Film Library Association.

Bibliography.—GENERAL HISTORY: Ramsaye, Terry, *A Million and One Nights*, 2 vols. (New York 1926), the history of the motion picture; Hampton, Benjamin, *A History of the Movies* (New York 1931), an examination of the business; Schulberg, Budd, *What Makes Sammy Run?* (New York 1941), a novel of Hollywood and its people; Moley, Raymond, *The Hays Office* (New York 1945), a study of the industry from the viewpoint of Will H. Hays, president of the Motion Picture Producers and Distributors of America, Inc.; "The Motion Picture Industry," *Annals of the American Academy of Political and Social Science*, vol. 254 (Philadelphia 1947); Inglis, Ruth, *Freedom of the Movies: A Report on Self-Regulation* (Chicago 1947); Quigley, Martin, Jr., *Maine Shad oves* (Washington 1948), the prehistory of the motion picture; Robbins, Harold, *The Dream Merchants* (New York 1949), a novel of little people in a big business; Rotha, Paul, and Griffith, Richard, *The Film Till Now* (New York 1950), a survey of world cinema; Mayer, Arthur, *Merely Colossal* (New York 1953), factual saga of a career in distribution and exhibition; Quigley, Martin, Jr., ed., *New Screen Techniques* (New York 1953), a symposium of articles by inventors and engineers.

MOVING PICTURE ART: Lindsay, Nicholas Vachel, *The Art of the Moving Picture* (New York 1915); Seldes, Gilbert, *The Seven Lively Arts* (New York 1924); Barry, Iris, *Let's Go to the Movies* (New York 1926); Seldes, Gilbert, *An Hour With the Movies and the Talks* (Philadelphia 1929); Pudovkin, V. I., *Film Direction* (New York 1932); id., *Film Acting* (New York 1933); Barry, Iris, D. W. Griffith: *American Film Master* (New York 1940); Eisenstein, S. M., *The Film Sense* (New York 1942); Kracauer, Siegfried, *From Caligari to Hitler* (Princeton, N.J., 1947); Eisenstein, S. M., *Film Form* (New York 1949); Museum of Modern Art, *Film Notes The Silent Era* (New York 1949).

DOCUMENTARY PICTURES: Rotha, Paul, Road, Sinclair and Griffith, Richard, *Documentary Film* (London 1936 rev. ed. 1952); Waldron, Gloria, *The Information Film* (New York 1949); Manvell, Roger, *Cinema 1950* (London 1950); Griffith, Richard, *The World of Robert Flaherty* (New York 1953).

EDUCATIONAL FILMS: *Film Information Bibliography* EFLA Service Supplement (New York 1952); Krahn, Frederick, ed., *Educational Film Guide* (New York 1953); Dale, Edgar, *Audio-Visual Methods in Teaching*, 2d ed. (New York 1954).

MOWAT, mou'ät', SIR OLIVER, Canadian statesman: b. Kingston, Ontario, Canada, July 22, 1820; d. Toronto, April 19, 1903. Admitted to the bar, he practiced in Kingston and Toronto; was vice chancellor of Upper Canada, 1864-1872; and premier of Ontario, 1872-1896. He opposed Sir John A. Macdonald on the question of provincial autonomy, Mowat regarding the provincial legislature as sovereign within its own sphere, and his reading of the British North America Act was in this sense borne out by the

Imperial Privy Council, notably in the Ontario boundary dispute. In 1896, he entered the ministry of Sir Wilfrid Laurier (q.v.) as minister of justice and was made president of the Senate. He was appointed lieutenant governor of Ontario in 1897, and served until his death. Altogether, Mowat gave 45 years to the public service. He was given a knighthood in 1892.

MOWATT, Anna Cora. See RITCHIE, ANNA CORA OGDEN MOWATT.

MOWBRAY, mō'brā, name of an Anglo-Norman baronial house, founded at the Conquest by GILFRIED (DE MONTBRAY), bishop of Coutances. NIGEL, his nephew, founded the second house of Mowbray; WILLIAM, 4TH BARON MOWBRAY (d. 1222?), great grandson of Nigel, was a leader in the rising against King John. JOHN DE MOWBRAY (1328?-1368) gained by marriage the earldom of Nottingham and the marshalship of England; his second son Thomas, obtained a dukedom. The line ended with JOHN, 4TH DUKE OF MOWBRAY (1444-1476), the dukedom passing to the Howard family after his daughter Anne died in 1481.

MOWBRAY, Henry Siddons, American decorative and figure painter: b. Alexandria, Egypt, Aug. 5, 1858; d. Washington, Conn., Jan. 15, 1928. After a year at the United States Military Academy, he abandoned a military career for art. In 1878 he went to Paris where he studied under Léon J. F. Bonnat. From 1886, he maintained a studio in New York where he executed many beautiful murals. He began his work as an illustrator and portrait painter but later confined himself to decorative painting in which he displayed taste in composition, perfection in draftsmanship, and warmth of tone. The *Development of the Law*, in the Appellate Court in New York City is a fine example of his work. His murals may be seen in the Congressional Library, Washington, D.C., the Federal Court, Cleveland, Ohio, Gunn Memorial Library, Washington, Conn., The Morgan Library, New York City. He was elected a national academician in 1891, and in 1903, he became the first director of the American Academy in Rome.

MOWBRAY, J. P., a pseudonym of Andrew Carpenter Wheeler (q.v.).

MOWER, mou'ēr, Joseph Anthony, American soldier: b. Woodstock, Vt., Aug. 22, 1827; d. New Orleans, La., Jan. 6, 1870. After two years at Norwich University and a year working as a carpenter he enlisted in the Engineer Corps and served throughout the Mexican War. Commissioned 2d lieutenant in the regular army in 1855, he attained his captaincy in 1861. His Civil War career was one of the most distinguished. Regular army brevet commissions followed more rapid promotions in the volunteer forces. As major general of volunteers he accompanied the Missouri expedition against Price, then joined Gen. W. T. Sherman in the Atlanta campaign (November 1864) and led a division in the march to the sea. Mustered out as brevet major general in February 1866, he was recommissioned a colonel of infantry. At his death he was in command of the department of Louisiana.

MOWRER, mour'ēr, Edgar Ansel, Amer-

ican journalist: b. Bloomington, Ill., March 8, 1892. In 1913, after study at the Sorbonne, in Paris, he graduated at the University of Michigan, and thereupon returned to France, where he became a contributor to American and English publications. On outbreak of World War I, in 1914, he joined the Paris bureau of the Chicago, Ill., *Daily News*, which was headed by his brother, and reported the campaigns in France, Belgium, and Italy. He represented his paper in Italy until 1922 when he secured transfer to the *Daily News* bureau in Berlin. His frank and critical dispatches reporting the disintegration of the Weimar Republic were republished in book form as *Germany Puts the Clock Back* (1932; rev. ed. 1939), earning him the Pulitzer Prize in journalism for the best foreign correspondence, but incurring for him the hatred of the Nazis. He was ordered to leave Germany and, in 1934, after a lecture tour in the United States, he succeeded his brother as chief of the *Daily News* bureau in Paris. While occupying this post he reported the Spanish Civil War, 1936, and visited the Soviet Union, 1937, and China, 1938. Returning to the United States in 1940 after the German occupation of Paris, he was appointed Washington correspondent of his newspaper. The following year he visited the Orient for a second time, then joined the government service as deputy director of the Office of War Information; he continued in that post until February 1943. Since then he has been active as a columnist and broadcaster on foreign affairs.

His books include: *The Dragon Awakes* (1938); *Global War* (with Martha Rajchman, 1942); and *The Nightmare of American Foreign Policy* (1948); *Challenge and Decision* (1950).

MOWRER, Paul Scott, American journalist: b. Bloomington, Ill., July 14, 1887. He became a reporter on the Chicago, Ill., *Daily News* in 1905 and, in 1910, after two years at the University of Michigan, he was made Paris correspondent for that newspaper. He reported the first Balkan War, 1912-1913, and throughout World War I he directed his newspaper's services in France. Subsequently he reported the proceedings of the Paris Peace Conference, 1918-1919, and of five conferences on limitation of armament, 1921-1933; during 1924-1925 he participated as correspondent in the Moroccan campaign in the Riff. In 1928, he was awarded the Pulitzer Prize for the best foreign correspondence. In 1934, he was made associate editor and chief editorial writer of the Chicago *Daily News*, and the following year he became editor of the newspaper, a position he held until 1944. In 1945 he became European editor of the New York *Post*. He wrote several books, including *Balkanized Europe* (1921); *Our Foreign Affairs* (1924); *The Foreign Relations of the United States* (1927); *The House of Europe* (1945). Among volumes of verse were *Poems Between Wars* (1941). Edgar Ansel Mower (q.v.) is his brother.

MOXON, mōk's'n, Edward, English publisher and verse-writer: b. Wakefield, Dec. 1801; d. Putney Heath, June 3, 1858. He was a close friend of Charles Lamb, whose adopted daughter, Emma Isola, he married in 1833. In 1831, he founded the *Englishman's Magazine*, but it was not a success and ceased to appear the following year. Upon publishing the first complete works

of Percy Bysshe Shelley (q.v.), he was prosecuted and convicted in 1841 because of blasphemous passages in *Queen Mab*; though compelled to delete them, he escaped further punishment. He visited William Wordsworth (q.v.) at Rydal Mount in 1846, and continued as his publisher until the poet's death in 1850. Other well-known authors whose works he published included Southey, Tennyson, Browning, and Landor. Though lacking in original talent, he was a true lover of poetry. His volumes of verse comprised *The Prospect and Other Poems* (1826); *Christmas* (1829); *Sonnets* (1830 and 1835).

MOZAMBIQUE, mō-zam-bēk', or **POR-TUGUESE EAST AFRICA**, colonial possession of Portugal bounded on the east by the Indian Ocean, on the north by Tanganyika Territory, and on the south by the Natal Province of the Union of South Africa; the western boundaries, from north to south, comprise Lake Nyasa, Nyasaland Protectorate, the Rhodesias, the Transvaal, and Swaziland. The area is 297,731 square miles, and at the census of 1940 the population numbered 5,081,266, of whom 5,027,591 were Africans, and whites totaled 27,438. With surrender of sovereign rights on July 19, 1942, by the Companhia de Moçambique, last of the chartered companies operating in the territory, all of Mozambique came under a single colonial administration. Lourenço Marques (pop. 1936, 47,390), the capital and principal seaport, is situated on Delagoa Bay, near the southern extreme of the colony. Other ports include Beira (pop. 12,988), formerly the capital of the lands of the Companhia de Moçambique, and terminus of railways to Southern Rhodesia and Nyasaland Protectorate; and Mozambique, or Moçambique, until 1907 the country's capital.

Topography.—The coastline of Mozambique, nearly 1,500 miles in length, extends southward from Cape Delgado, near the mouth of the Rovuma River, to Oro Point, just above Kosi Bay. Low-lying swamplands fringe the shores as far north as Mozambique, and from there onwards the coasts are rugged. North and south of the wide delta of the Zambezi many rivers flow into the Indian Ocean, among them the Lurio, Ligonha, and the great Limpopo. Numerous lateral waterways connect the large rivers. The Urema and the Zanque, whose waters flow south and north from a marsh at a slight elevation, almost unite the Zambezi with the Pungwe and the Kwakwa, and join the Zambezi with the Bons Sinais; the latter is also connected with the Munguzi, so that a small amount of canalization would render possible an inland waterway from Beira to Quelimane, a distance of more than 300 miles. Inland from the coastal plains the surface rises to a grassy plateau lying generally at an elevation of 6,000–8,000 feet above sea level; at the northwestern end of the country the plateau terminates abruptly in an escarpment, below which, near the shores of Lake Nyasa, the general level is some 4,000 feet lower. While most of the highlands are healthful for white people, they have a relatively small white population because of poor communications; much has been done to improve health conditions in the large coastal towns, but elsewhere in the lowlands, and in the valleys of the largest rivers, malaria is endemic and climatic conditions difficult for those

not reared in the country. For Mozambique as a whole the dry season extends from May to September.

Flora and Fauna.—Many varieties of tropical and semitropical plants flourish in Mozambique. Mangrove trees are plentiful in the deltas of the rivers and along the coast, as are date palms, while the coconut palms are ubiquitous. In the highlands are considerable forests with many kinds of hardwoods, notably ebony and ironwood, and through the grasslands are vast areas studded with acacias. Despite indiscriminate hunting in the past, some parts of the country still teem with large game. Lion, leopard, and other carnivora are plentiful, as are such hoofed animals as the elephant, black rhinoceros, zebra, hippopotamus, and buffalo. There are many varieties of gazelles and antelopes on the open grasslands, and monkeys and baboons in the forests. Since earliest times of Portuguese settlement gold mining has been carried on in Mozambique. By far the most important goldfield is that of Manica, some 220 miles northwest of Beira, the reefs extending across the border into Southern Rhodesia; silver and other minerals are also found in the Manica district. On the north side of the valley of the Zambezi, in the neighborhood of Tete, large deposits of good coking coal have been found in seams ranging up to 25 feet in thickness; other deposits have been located in Chicoo, and at several places between Tete and the border of the Nyasaland Protectorate. In the Tete district, too, rich deposits of magnetite iron have been located, some of the ore containing up to 75 per cent of iron. Copper exists over an extensive area in the Serra Itsitica, on the western boundary of the country, and tin has been found at Inchope and Doeroi.

Population and Education.—The native Africans of Mozambique are almost entirely of Bantu stock. They are expert stockmen and agriculturists, and many thousands of them are recruited annually for labor in the gold mines of the Witwatersrand (q.v.) and for work in Southern Rhodesia. Considerable revenue accrues to the Mozambique government from this employment of its natives in British territory; it receives "pass money" on every native leaving the country as a contract laborer and "customs duty" on his return, besides a subsidy should his stay be extended over six months. Both the central government and the municipalities conduct schools for native and white children, and schools for natives are also attached to many of the Christian missions. Primary schools in 1942 numbered 697 (with an enrollment of 103,081); and there was one high school (614 pupils) and 48 vocational schools (3,232 pupils). The greatest share of missionary work is done by the Roman Catholic Church; the few Protestant missionary bodies operating in Mozambique include that of the American Methodists, whose principal station is in Inhambane. British subjects comprise a large proportion of the white population, otherwise consisting principally of Portuguese; most of the whites live in the towns, as do, also, the Indians (9,147 in 1940), most of whom are engaged in retail trade.

Government.—A governor general appointed for a four-year term by the government of Portugal heads the administration. He is assisted by an Executive Council and by a Legis-

lative Council; besides officials and nominated nonofficials, the membership of the latter body includes elected representatives of the four provinces into which the country was divided in 1942 after the last of the chartered companies surrendered its sovereign powers (see *History*). Lourenço Marques, besides being the capital of Mozambique, is also the seat of the provincial administration of Sul do Save, all that area of the country south of the Save River. The Province of Manica and Sofala extends from the Save to the Zambezi, and northwest to the latter river as far as the frontiers of Northern Rhodesia and Nyasaland Protectorate; Beira is the provincial capital. Northeast of Manica and Sofala is the Province of Zambezia, in which the capital is Quelimane; Mozambique, or Moçambique, is the chief town of Nyassa, or Niassa, the northernmost province. In 1944, the revenue and expenditure of the country balanced at 658,524,000 escudos; the public debt stood at 5,000,000 escudos on Dec. 31, 1943.

Agriculture and Manufacturing.—Mozambique has extremely fertile soil, and, despite great heat and unhealthiness, there is considerable agricultural activity. Sugar, sisal, and copra are produced on large plantations, and corn (maize) and cotton are widely cultivated. Other crops include peanuts, beans, and fruits in wide variety. The cutting of mangrove bark is an important industry along the coasts, and large numbers of men are employed in lumbering, the hardwoods of the forests commanding a good market for furniture making and as railway ties (sleepers); several wild vines yield rubber of superior quality. Stock raising is carried on in many parts of the country, particularly in the Tete district (the northwestern area of the Province of Manica and Sofala) and in the Sul do Save Province. Besides gold and coal, the principal minerals being exploited are copper and tin. Manufacturing industries are few. Cement and soap are made in the vicinity of Lourenço Marques, and paper is manufactured, while vegetable oil is produced at several places. Total exports of Mozambique in 1943 were valued at 469,768,000 escudos.

Communication.—Markets for many of the country's exports are in contiguous British territories. The products are carried on railways across Mozambique built from the seaports with British capital principally for the large transit trade. One line from Lourenço Marques, 57 miles in length, connects at Komati Poort in the Transvaal with the system of the railway system of the Union of South Africa; and a second from the capital runs to Goba, 44 miles distant, on the Swaziland border, whence South African railway motor buses traverse the protectorate to meet the Union's system at Bremersdorp. From Beira, a line extends westward across the country to Macequece, a distance of 183 miles, and continues for 13 miles to enter Southern Rhodesia, eventually connecting with Salisbury and Bulawayo. A second line from Beira runs northward to Muriaça on the Zambezi, crosses the river by the longest railway bridge in the world (12,064 feet), and continues to link up at Port Herald with the railways of the Nyasaland Protectorate. Few of the 20,000 miles of highways in Mozambique are fit for motor traffic during the rainy season (October to March). Seaports, in addition to those mentioned above, include, from

north to south, Porto Amelia, located on Pemba Bay, which is one of the most spacious harbors in the world (8 miles long, 5 miles wide, with an entrance 1½ miles wide); Porto Amelia was the capital of the territory of the Companhia do Nyassa, a former chartered company. Chinde, situated at one of the mouths of the Zambezi River, was the port of entry for Nyasaland Protectorate until river freight services were discontinued following construction of the railway from Beira. Inhambane, 284 miles north of Lourenço Marques, has a harbor 9 miles long by 5 miles wide; a Portuguese settlement was first established there in the middle of the 16th century.

History.—Arab influence was paramount along the eastern seaboard of Africa in 1498, when Vasco da Gama (q.v.) visited Quelimane and the town of Mozambique (q.v.) before continuing his voyage to Mombasa (see KENYA COLONY AND PROTECTORATE) and thence to India. Sofala, a little to the south of Beira, was captured by the Portuguese in 1505, and Mozambique, or Moçambique, in 1507, and from this period dates the commencement of the great dominions of Portugal on the East African littoral. During the height of the Portuguese power considerable progress was made in the exploration of the territory, notably by members of the Jesuit and Dominican orders. Gonçalves da Silveira, a Jesuit priest, traveled to the region southwest of the delta of the Zambezi and visited the *monomotapa* (ruler) at Beira, his capital, on the Mazoe River; the missionary and his converts were strangled here on March 18, 1561. Subsequently the monomotapa's sphere of influence became the Dominican Mission Province No. 14 of the Rosary. For two hundred years the Portuguese settlements along the coast were subject to frequent assault, first by the Arabs and the Turks, and later by the Dutch, and by 1730 all those north of the Rovuma River had been extinguished. Even that which remained to Portugal (the area subsequently known as Mozambique) was overrun early in the 19th century by Bantu tribesmen from Gazaland (q.v.), who captured and for a time held most of the Portuguese seacoast towns. By the middle of the century migration of Dutchmen from Cape Colony had resulted in establishment of the South African Republic in the Transvaal (q.v.), across Mozambique's southwestern frontier; and, following the work of explorers in the interior of Africa, British and German spheres of influence were created in proximity to the other land frontiers of the country. Disputes then arose regarding the precise boundaries of the area of East Africa over which Portugal claimed sovereignty. Her right to Delagoa Bay was established by arbitration in 1875; and at the international Berlin Conference in 1884-1885, and by a convention with Great Britain in 1891, all boundaries of Mozambique were finally determined.

Thenceforth the colony was variously administered, some regions directly through officials appointed by the Lisbon government, and others by chartered companies exercising sovereign rights. The state administered two districts in the south, Lourenço Marques and Inhambane and, across the center of the country, the districts of Tete, Quelimane, and Moçambique. Manica and Sofala, lying between these two divisions, was administered by the Companhia de Moçambique, rights over this area of 65,000 square miles being granted to it by royal decrees in 1891, 1893, and

1897; and the Companhia do Nyassa, or Niassa, received a charter in 1894 to administer the 73,292 square miles situated at the northern end of the colony. Although not chartered, the Companhia da Zambesia administered on behalf of the colonial government much of its Tete district. The last-named surrendered its administrative powers during World War I, and the Companhia do Nyassa, in 1929; while, as noted above, the territory of the Companhia de Moçambique was taken over by the colonial government in 1942. Portuguese colonial forces, during World War I, took a small part in the later stages of the East African campaign against the Germans. The latter, expelled from German East Africa (later Tanganyika Territory), retreated across the Rovuma River into Mozambique in November 1917. By July 1918, the German troops had advanced through the colony to within 25 miles of Quelimane, and then were driven northwestwards (eventually to surrender in Northern Rhodesia). At the Paris Peace Conference in 1919 Portugal obtained retrocession to Mozambique, "as the original and rightful owner," of the Kionga Triangle, an area of 400 square miles on the right bank of the Rovuma River, near its mouth, hitherto administered by German East Africa, which had thus been able to levy export dues on riverine exports from the northwestern end of the Portuguese colony. Consult Prestage, Edgar, *The Portuguese Pioneers* (London 1933) and *Chapters in Anglo-Portuguese Relations* (Watford, England, 1936); Axelson, Eric, *South-East Africa, 1488-1530* (London 1940); *Annuário de Moçambique* (Lourenço Marques annual).

MOZAMBIQUE, or **MOÇAMBIQUE**, seaport of the Portuguese colony of Mozambique, on a small coral island three miles from the shores of Mosuril Bay. Visited by Vasco da Gama (q.v.) in 1498, it was captured by the Portuguese in 1508. Numerous buildings dating from the 16th century still stand, many of the barred windows having the original panes of mica, used in place of glass. The principal fort, which still exists, was built during 1508-1511 of stone brought from Portugal, 8,000 miles distant, in the tiny vessels of the period. From Lumbo, on the mainland south of Mozambique, a railway runs to M'conta, a distance of 58 miles. The commercial importance of Mozambique declined after transfer of the capital of the colony from that town to Lourenço Marques in 1907. Pop. 6,817.

MOZAMBIQUE CHANNEL, the passage between the east coast of Africa and the island of Madagascar, about 1,050 miles long from northeast to southwest, 530 miles wide at its southern entrance, about 250 miles wide in the center and nearly 600 miles wide at the northern entrance, where lie the Comoro Islands (Isles Comores). At one period the Mozambique Channel was a noted resort of pirates. On its west shore, the coast of the Portuguese colony of Mozambique, are several harbors, including those of Mozambique (or Moçambique), Quelimane, Chinde, and Beira.

MOZARABS, term applied in Spain to those Christians who, under the Moorish domination, maintained their old life and religious practices amid the Moslems. The liturgy preserved by these people is known as the Mozarabic; some-

times it is styled *Officium Gothicum* or *Isidore Missale*, because it was in vogue during the Gothic domination and was first revised by the great and learned Isidore of Seville in the 6th century.

MOZART, mō'tsärt, (Johann Georg) Leopold, German musician: b. Augsburg, Germany, Nov. 14, 1719; d. Salzburg, Austria, May 28, 1787. Father and teacher of Wolfgang Amadeus Mozart (q.v.), he was the son of a bookbinder and came to Salzburg in 1737 to study law. In 1743 he joined the court orchestra as a violinist, and later was promoted to court composer and assistant conductor. He was a teacher and composer of high reputation and possessed unusually versatile interests. In 1756 he published his *Violin School*, the very first of its kind, which was translated into various languages. He devoted many years almost exclusively to the education and promotion of his son, repeatedly facing dismissal from the orchestra because of his frequent absences, but was continued in his post until his death.

MOZART, Wolfgang Amadeus (real name JOHANNES CHRYSOSTOMUS WOLFGANGUS THEOPHILUS), Austrian composer: b. Salzburg, Austria, Jan. 27, 1756; d. Vienna, Dec. 5, 1791. Titled archbishops were the rulers of Mozart's native Salzburg and the surrounding country until 1803. Mozart's father, the Swabian Leopold Mozart (q.v.), held a respectable musical position at their court. His mother came from near-by St. Gilgen, on the Lake of St. Wolfgang.

Wolfgang was the youngest of seven children, five of whom died at a tender age. At three he began to play the harpsichord, a little later the violin and the organ; at five he had already tried to compose. He and his sister Maria Anna (Nannerl), who shared Wolfgang's child prodigy career, were taught from notebooks in which their father copied simple pieces by Austrian and German composers.

In 1762 the family started on a series of concert tours which eventually took them all over central and western Europe; in 1769, Wolfgang went to Italy with his father. Mozart was pampered by the imperial family in Vienna and the kings of France and England, and was knighted by the pope. Musicians and scientists tested and appreciated him. At 14 he was made a member of the conservative Philharmonic Society of Bologna, Italy. Only a series of dangerous illnesses, including smallpox and scarlet fever, interrupted constant work. Leopold Mozart's noisy publicity was critically remembered later, when the adolescent Wolfgang tried to obtain a steady position at some respectable court. On the other hand, he gained invaluable experience by hearing a cross section of the important music of his day. Early impressions of immediate effect were the meetings in Paris with Johann Schobert (d. 1767), who introduced the child to the poetical nature of music; and in England with Johann Christian Bach (1735-1782), the youngest and Italianized son of Johann Sebastian Bach. Wolfgang became familiar with Italian and French operas of current taste, as well as those by the innovator Gluck (1714-1787); with instrumental music of Joseph Haydn (1732-1809), and that by older masters of various nationalities. He studied voice with an Italian vocalist and counterpoint with the eminent polyphonist, Padre Mar-

ni (1706-1784), of Bologna. He also gave a concert with the famous Mannheim Orchestra and heard the works of Handel (1685-1759) performed in England, but these experiences were only to bear fruit much later.

At the age of eight, in Paris (1764), he had his first set of sonatas for violin and piano printed, and also discovered the ability to improvise for which he became famous. A few months later, in England, he composed his first symphonies, in Italian style. At 12, in Vienna (1768), he wrote his first *opera buffa* (*La finta semplice*, commissioned by Emperor Joseph II), his first Singspiel (*Bastien und Bastienne*), and his first mass. At 14, in Italy (1770), he composed his first string quartet and his first *opera seria* (*Mitridate, Re di Ponto*, under contract at Milan).

At home between trips, his father taught him languages, mathematics, and counterpoint. His chief model during these periods was Michael Haydn (1737-1806). In 1769 he was made concert master to the Salzburg court orchestra, where his duties later included composition for entertainment and church services.

In the early 1770's, Mozart's style took on a more subjective note. This process was speeded up by his first personal troubles. The new archbishop, Hieronymus Count Colloredo, did not like him and lost no opportunity to belittle him. Mozart's popularity with Salzburg aristocrats and burghers as a teacher and composer could not make up for abuse at court. On leave in Milan, where he was under contract for another *opera seria* (*Lucio Silla*, 1772) his new personal idiom that led away from the traditional Italian operatic style failed to please. He was not asked to return to Italy, but an Italian flavor remained forever attached to his music.

In the fall of 1777, Mozart resigned from the Salzburg court and went on a final journey with his mother. In Munich he was impressed with attempts to present opera in German. In Mannheim, the famous orchestra had a marked effect on his symphonic style. The symphony he wrote in Paris (*Paris Symphony*, 1778) was more fully scored and more colorful than his earlier ones. Among his other Paris compositions were the ballet music to *Les petits riens*, and a set of piano sonatas including the one in A Major with the Turkish rondo. In general, the sojourn in Paris was a failure, heightened by the sorrow of his mother's death. Early in 1779, Mozart returned to Salzburg to a better position with the court orchestra. His aversion to his home town and its sovereign archbishop, however, remained unabated.

Mozart's next important work was *Idomeneo, Re di Creta*, an *opera seria* commissioned by the elector of Munich (1781). It was Mozart's first mature opera, and for the first time he took a hand in the shaping of his libretto. The score is rich and colorful and the treatment of the choruses points to Gluck's influence.

Shortly thereafter, the final break between Mozart and the archbishop developed during a state visit to Vienna. This step carried with it an estrangement from his father, who had long criticized his son's lofty ambitions. Wolfgang Mozart owed valuable teaching and stern discipline to Leopold, but they were fundamentally different in character. The son lacked the cunning yet ponderous mind of his German father. He was emotional and frank, oversensi-

tive and optimistic, and opposed to menial tasks.

Mozart's pleasant demeanor, his superb piano playing, and his reputation as a teacher made him popular with the people of the highest rank, including the emperor, Joseph II. Although the court theater was traditionally Italian, and Gluck's Italian disciple, Antonio Salieri (1750-1825), was a court composer (the other being Gluck himself), Mozart was commissioned to write *Die Entführung aus dem Serail* (*The Abduction from the Seraglio*, 1782) for a group with which the emperor attempted to promote Singspiel in German. It was the first musical comedy in German which can be called an opera.

On Aug. 4, 1782, Mozart married Constanze Weber (1763-1842), a relative of the much younger Karl Maria von Weber, and sister of two excellent singers. Mozart had courted one of the sisters in Mannheim prior to her marriage, and for the other he was later to write the difficult arias sung by the Queen of the Night in *Die Zauberflöte* (*The Magic Flute*). Mozart's married life was happy in spite of Constanze's scanty education and her shortcomings as a housewife. They had five children, only two of whom survived infancy. The younger son, Wolfgang Amadeus, Jr. (1791-1844), had some musical talent and led an inconspicuous existence as a teacher and composer.

The most popular instrumental works from Mozart's first years in Vienna are the *Haffner Symphony* and a series of six string quartets, written under the influence of Haydn's matured quartet style and dedicated to him. During nine years of exemplary friendship, Mozart received valuable hints from Haydn in the handling of thematic material and form, while he in turn considerably affected the older man's treatment of the instruments. Haydn was the only contemporary musician who fully appreciated Mozart; and he repeatedly called him the greatest composer of all time.

In the summer of 1783, Mozart took his wife to Salzburg. On their way back through Linz he composed a symphony for a private performance there (*Linz Symphony*). Although a devout Catholic, Mozart became a Freemason in 1784 and repeatedly wrote music for occasions at his lodge. The winter of 1784-1785 was the most prosperous in Mozart's adult life. From this period date many piano concertos written for his own concerts, which were unprecedented in the interplay of the solo instrument with the orchestra. They became the point of departure for Beethoven's concertos.

Mozart's real desire, however, was directed toward opera. His urge to write for voice found its outlet in a number of songs, the most popular being the setting of Goethe's poem, *Ein Veilchen* (*A Violet*, 1785), until he and the Italian court poet Lorenzo Da Ponte (1749-1838) decided on an adaptation of the much-discussed French play *Le Mariage de Figaro* by Pierre A. C. Beaumarchais. With *Le Nozze di Figaro* (*The Marriage of Figaro*, 1786), Mozart achieved the perfection of *opera buffa*. It was also the high point in his own life. Thereafter his popularity in Vienna declined.

The Italians in the Vienna opera managed to have *Figaro* shelved after nine performances. Mozart had better luck in Prague, where he visited early in 1787 and was lionized as in

his childhood days. In a concert there he conducted a new symphony, the *Prague Symphony* (without a minuet), written in a gloomy mood the preceding year. He returned with an opera contract for Prague. Back in Vienna, he found his operas crowded out and his music called modernistic. In the spring young Ludwig van Beethoven (1770-1827) came from Bonn to play for Mozart, who prophesied a great future for him.

In May 1787, Leopold Mozart died. Mozart's own mind had been preoccupied with death for some time. The string quintets from that period, particularly the one in G Minor, are expressions of profound sadness, but somewhat later works, such as the serenade *Eine Kleine Nachtmusik* (1787), reveal nothing of that nature. Mozart had started on the opera for Prague, for which he and Da Ponte had chosen the legend of Don Juan (*Don Giovanni*, 1787). The opera was classified by Da Ponte as *dramma giocoso* (gay drama). With significant symbolism dictating the treatment of the characters and the orchestra, it was highly unconventional at the time. It has been discovered that Casanova (1725-1798) contributed the words to an important scene. The first performance was the sensation of the Prague season, but the press was not enthusiastic, and the work did not please in Vienna at its première there the following May.

After the death of Gluck in November 1787, Mozart was named court composer—an honor he had long coveted. The only imperial commissions he received, however, were dances for the Carnival. His fee, much smaller than Gluck's, was inadequate, and the news from France heralding the revolution alarmed many potential patrons into thrift. Thereafter, Mozart was almost constantly in debt and dependent upon loans. A fellow Mason, the merchant Puchberg, was more than once responsible for saving him from starvation.

Within six weeks, in the summer of 1788, Mozart wrote his three "big" symphonies: the lyric in E Flat Major, the tragic in G Minor, and the powerful one in C Major that was later named *Jupiter*. They represent the culmination of his symphonic work and, together with Haydn's last 12 symphonies of a few years later, the perfection of classical symphony.

Physical and mental strain had left their marks on Mozart's health. A trip to Berlin (1789) did not bring the expected financial relief, but Mozart was rewarded by a chance to pore over Bach's manuscripts then still gathering dust in the archives at Leipzig. Their effect on his last chamber music and the *Requiem* was tremendous.

A successful revival of *Figaro* led the emperor to order another *opera buffa* from Mozart and Da Ponte, *Così fan tutte* (1790), a parody on a real incident. Reaching back into the earliest stages of comic opera, written in a shadowy delicate idiom, the music is a supreme example of Mozart's ability to detach himself from his personal troubles while composing. The opera was a great success, and might have solved Mozart's financial worries. But Emperor Joseph died and his brother and successor, Leopold II (1790-1792), did not care for music. Mozart was completely ignored. All he could obtain was an unsalaried position as assistant conductor at St. Stephen's Cathedral. In the summer of 1791, when he received a commission to write an *opera*

seria (*La Clemenza di Tito*) for the emperor's coronation as king of Bohemia, he was a sick and depressed man. His interest was absorbed in two other works: *Die Zauberflöte* (*The Magic Flute*) and a *Requiem*.

The Magic Flute, based on a libretto by an old acquaintance and fellow Mason, Johann Emanuel Schikaneder (1748-1812), who operated a suburban popular theater, was originally meant to be a fairy tale burlesque of a type very common in those days. It was written in the form of a Singspiel, poorly worded, its action interspersed with flashy stage effects. A glorification of Freemasonry was introduced in the middle of the first act and caused a break in dramatic logic that was not restored. Yet its deeper dramatic qualities were musically expressed with so much spontaneity, appropriateness, and lightness of touch that it became the point of departure both for German romantic opera and for Viennese operetta.

Mozart's last completed works were a concerto for his preferred orchestral instrument, the clarinet, and a brief cantata for his Masonic lodge. The work on the *Requiem*, ordered by a mysterious stranger in the name of an undisclosed sponsor (who wanted to present it as his own) created in Mozart's overstrained nervous condition the fixed idea that the messenger had been a herald of death. To this was later added the obsession of having been poisoned by Salieri. The last shred of Mozart's strength was spent in the composition of the *Requiem*. His profound Catholicism found vent in the blissful expression of the joys of eternity. By the end of November he collapsed; continuing to write or dictate or even to sing parts of the *Requiem* on his death bed, he passed away in the early morning hours of Dec. 5, 1791. He was buried in a pauper's grave. The *Requiem* was finished by his pupil Franz Xaver Süssmayer (1766-1803).

A few days before Mozart's death, substantial commissions had come in which might have made him a well-to-do man. His fatal illness, a kidney disease, was traced by later research to his early attack of scarlet fever.

Mozart's works were brought into chronological order by Dr. Ludwig Alois Friedrich Ritter von Köchel (1800-1877), an instructor at the Vienna court. The catalogue, first issued in 1862, has been brought up to date several times by more recent findings. The last edition was published by Dr. Alfred-Einstein in 1936. The letter K. (Köchel with a numeral after the classification of a Mozart work therefore stands for its opus number. So far, 626 authentic works have been listed, a very large number in view of Mozart's short life. He wrote very quickly, detached from surroundings or circumstances to a degree that has become legendary. He attributed his apparent facility to the hard studies in his youth.

Mozart is one of the greatest composers in musical history. He lived during the time when our classical forms were evolved, particularly symphony (q.v.) and chamber music, and he used both old and new structures. His most characteristic form of instrumental music was the piano concerto, to the development of which he contributed decisively. His was improvement rather than innovation; he helped to perfect all the branches of music, but made no attempt to create new styles. Even where he established a precedent, as in German opera, he fol-

owed existing rules. The novelty of his music lies in its expressiveness, which he sometimes increased by the then uncommon use of chromatic successions and even dissonances. One of Mozart's most striking qualities is the combination of universality and discrimination. His astounding musical memory and early training in writing any kind of music helped him acquire his technical certainty. While wavering between models, tastes, and trends during his formative years, he chose from among them and retained what he could use for their later fusion into his personal idiom. His music came to represent the blending of vocal and instrumental, melodic and contrapuntal, symphonic, and dramatic elements to a degree that has not been reached before or since.

Mozart's part writing is clear and transparent. His feeling for balance and sound was phenomenal. The flow of his inspiration never ceased. His music, ever fresh and young, is a mirror of the composer himself, who was both naive and complicated, gay and melancholy, courtier and buffoon. He always remained natural, and his fundamental goodness was spoiled neither by his triumphs as a child prodigy nor by the ordeals of later struggles.

While Mozart ranked foremost among the pianistic celebrities of his day, he was, to his distress, not so fully appreciated as a composer. His contemporaries called some of his music ponderous and modernistic. Enthusiasts of 19th century romanticism pictured him as a perumed clavichord player of a remote era. Only in the 20th century has he been recognized as the dramatic composer he considered himself to be.

ANN M. LINGG,
Author of "Mozart."

MOZIER, mō'zhēr, **Joseph**, American sculptor. b. Burlington, Vt., 1812; d. Faids, Switzerland, 1870. He was a merchant in New York from 1831 till 1845, when he retired and went to Rome to open a studio to practice as sculptor. He produced quite a number of figures, the best known being *Pocahontas*, *The Wept of Wish-ton Wish*, *Rispa*, *Rebecca at the Well*, *Jephthah's Daughter*, *Undine*, *Queen Esther*, *Truth*, *Silence*, and *The Prodigal Son*, etc.

MOZLEY, **James Bowling**, English clergyman: b. Gainsborough, Lincolnshire, Sept. 15, 1813, d. 1878. He was educated at Grantham and was graduated (1838) at Oriel College, where he became a close acquaintance of Newman, Pusey, Froude, etc. He participated in the Oxford Movement, but could not accept the Roman communion and some other features. In 1869 he was made canon of Worcester and was created regius professor of divinity at Oxford in 1871. His *Essays, Historical and Theological* (1878), were published in two volumes, with his sister's biographical comment in the preface.

MR. MIDSHIPMAN EASY, published in 1836, is probably the best known of the many sea novels by Capt. Frederick Marryat. This spirited and entertaining story deals with the life of John, otherwise known as Jack Easy, from the time of his birth to his settlement in life by marriage and inheritance of an important estate. A youth of fine qualities, he is spoiled at home by his mother and educated in

ideas of equality by his father. Much against their will he is sent to sea as midshipman at an early age and at the end of four years returns quite cured of odd ideas and with a fine record for bravery. His exciting and humorous adventures in the service of the Royal Navy made up the bulk of the book, which gives a lively picture of sea actions and a sailor's life on shore and on board ship. The galaxy of characters, part serious, part comic, is an especially good one. The deeper purpose of the novel is to show the more humane and chivalrous side of naval warfare and to set forth the finer traditions of the service.

WILLIAM T. BREWSTER.

MR. POIRIER'S SON-IN-LAW. See I.E. GENDRE DE MONSIEUR POIRIER.

MUCH ADO ABOUT NOTHING. *Much Ado about Nothing* is first mentioned in August 1600 and was printed in the same year. It is not referred to in Meres's famous list of Shakespeare's plays in 1598, unless indeed it is to be identified with the mysterious comedy, *Love's Labour's Won*, which Meres includes among Shakespeare's works. That *Much Ado*, in some less finished form than we now have, had been staged as early as 1598 under the title of *Love's Labour's Won*, is a bare possibility which hardly warrants speculation, but there is this to be said in its favor: it occupies among the comedies of Shakespeare's full maturity a position very analogous to that which *Love's Labour's Lost*, has among the early comedies. Each of these plays, when compared with others of the same period (with *The Two Gentlemen of Verona* and *A Midsummer Night's Dream* or with *As You Like It*, *Twelfth Night*, and *All's Well That Ends Well*) impresses the reader as a drama of the intellect rather than of the heart. Intrigue and wit overbalance romance in both, and personal planning largely takes the place of delectable chance. Benedict and Beatrice are finished studies which seem to have developed out of the sketches of Biron and Rosaline in *Love's Labour's Lost*. It goes with what has been said that this is a play of prose rather than poetry, of epigram rather than sentiment. Only a quarter of the lines are in verse, and this verse is seldom notable. The unflinching charm of the comedy lies in the infinitely brilliant superficiality of Beatrice and Benedick, the two archenemies of romance—in the unemotional cut and thrust of their badinage; and, next, in the ludicrous realism of the constables, Dogberry and Verges. All testimonies agree that this comedy is one of Shakespeare's most complete successes. It is also a remarkable evidence of the author's versatility, for it proves that he could execute with unsurpassed spirit and skill a type of play for which his other greater works would indicate that he had little natural inclination. *Much Ado about Nothing* is the only one of Shakespeare's major dramas which one can imagine that Congreve or Sheridan might have written. On the stage it has always been triumphant. When compared with its special corivals among Shakespeare's comedies—the more romantic *As You Like It* and *Twelfth Night*—it impresses one as suited rather more to the theater and rather less to the study. About a quarter-century after the poet's death, it was selected by

Leonard Digges among the special examples of Shakespeare's drawing power:

"Let but Beatrice
And Benedick be seen, lo, in a trice
The Cockpit, Galleries, Boxes, all are full." (1640)

David Garrick was a famous Benedick, and nearly all the greatest actresses have found opportunities for added laurels in Beatrice. The source of this play is relatively unimportant, for the greatest parts of it—the clownery of the constables and the figures of Beatrice and Benedick—seem to have sprung spontaneously from Shakespeare's brain. That part of the plot, however, which concerns Hero, Claudio and Don John is paralleled in several earlier works, in Spenser's 'Faerie Queene' (Bk. IV, ii), in Ariosto's 'Orlando Furioso' (Bk. V), and particularly in the 20th tale of Bandello's Italian *novelle* (printed 1554). It appears to have been from the last (possibly in the French or in some now unknown English version) that Shakespeare drew his hints; but the dramatist, besides altering the material in details, so subordinates it to the newer themes that it is likely to impress modern taste as either repellent or uninteresting.

TUCKER BROOKE.

MUCIC ACID, $C_6H_{10}O_8$, an organic acid formed by oxidizing milk sugar, or galactose, gum arabic and certain other substances, by the action of dilute nitric acid. It crystallizes in colorless tablets which are insoluble in alcohol, slightly soluble in cold water, and rather freely soluble in boiling water; though when boiled with water it becomes converted into an isomeric substance known as "paramucic acid." Mucic acid melts at about $410^\circ F.$, does not reduce Fehling's solution, and combines with ammonia and with metallic and organic bases to form an extensive series of salts.

MUCILAGE, a solution of gum in water. In chemistry, the gum of seeds and roots. The name is also given to commercial adhesive gum made from gum arabic or dextrin. Mucilages, in pharmacy, are water preparations of substances dissolved in water, used to suspend insoluble ingredients or to bind them together in a mass.

MUCIN, an albuminous proteid substance, which is an important constituent of the connective tissue of the animal body, and which gives to the mucous membranes their characteristic sliminess. It may be isolated by extraction with lime water (or with pure water), and subsequent precipitation with acetic acid, in excess of which mucin is insoluble. Mucin is not precipitated by heat nor by tannic acid. It is, however, precipitated by alcohol, or by saturating its solution with common salt, or with magnesium sulphate. When boiled with strong sulphuric acid, mucin yields leucine and tyrosine.

MUCIUS SCÆVOLA. See SCÆVOLA.

MUCKER, nickname of certain mystic fanatics who were thus popularly derided as "canting hypocrites." The adjective is of ancient origin and did not connote a specific sect until it was applied to the followers of Johann Heinrich Schönherr and later Johann Wilhelm Ebel in Königsberg. Schönherr, who was the son of a Prussian non-commissioned officer, and was educated under the theological faculty

of the University of Königsberg, combined odd ends of the Kantian philosophy with gleanings from the Bible into a dualistic neo-Gnosticism. Ebel, a Lutheran pastor, was a convert of his and in 1826 was joined by Johann Diestel, another pastor. The doctrine, which involved peculiar views as to the sexual relations, spread among fashionable circles in Königsberg. In 1835 Count Finckenstein, a former convert, accused Ebel and Diestel of immorality. They were unfrocked, but were not convicted of actual immorality. Consult Mombert, J. I., 'Faith Victorious' (New York 1882); Dixon, W. H., 'Spiritual Wives' (London 1868). See EBELIANS.

MUCORACEÆ, the molds. See FUNGI.

MUCOUS MEMBRANE. The mucous membranes line passages and cavities which communicate with the exterior of the body, where they become continuous with the skin. They constitute the lining of the alimentary canal or tract, which begins at the mouth and ends at the anus, a distance of about 27 feet, and is the passage through which the food for nutrition of the body is introduced, digested and taken up for the preservation and health of the body. They also form the lining of the nose, the throat, the middle ear, the various sinuses communicating with these cavities, the eyes, and of the respiratory apparatus, which comprises the lungs, the windpipe or trachea, and the larynx. The kidneys, the ureter, the bladder, the testes and the urethra in the male, and the Fallopian tubes, womb, vagina and vulva of the female are all lined with mucous membrane, together with the membrane of the ducts of glands which open upon it. In the female it becomes continuous with the peritoneum at the fimbriae of the Fallopian tubes. The surface of the mucous membranes of the body is subjected to the contact of various matters, such as the food, the air, and the different glandular secretions and excretions. They are protected from undue irritation by a viscid liquid called mucus (q.v.), which constantly bathes their surface, and are also well supplied with blood-vessels and nerves. The mucous membranes are not of a single origin, but may be derived from ectoderm, as is the case with the lining of the mouth, entoderm, as with the greater part of the digestive tract, or mesothelium, as in the urogenital ducts. A mucous membrane consists of an epithelium, or layer of lining cells; a connective-tissue basement-membrane, which may be hyaline and apparently homogeneous; and a further connective-tissue support or *tunica propria*. It usually is invaginated into glands, and may be evaginated into villae, as in the case of the stomach and intestine. For the diseases of the mucous membrane, see the respective organs or systems concerned.

MUCUS, a semi-fluid substance, of a viscid, tenacious character, produced by the various mucous membranes of animals, and found covering the exposed surface of such membranes. Thus it is produced in the mucous membrane lining the nose, the mouth and throat, the gullet, stomach, large and small bowel, the air-tubes of the lungs, the kidneys, ureter, and bladder, the gall-bladder, the ducts of glands, the bile-ducts, etc. In all these situations it serves to lubricate

membrane over the surface of which it is ad, and to protect the delicate surface from action of irritating agents. Its viscid character prevents it being readily removed, and enables it more effectually to discharge its protective function. It is to be noticed that many of the mucous membranes have special nodular structures embedded in them, which produce special secretions, not mucus, such as the mucous membrane of the stomach and intestines, whose secretions have special properties connected with the digestion of the food. The saliva from the mouth is a mixture of mucus and the special secretion from the salivary glands, which acts on the starchy elements of food. Other mucous membranes have no such special structures, and only mucus is secreted by them, such as the mucous membrane of the nasal passages. Mucus is secreted by glands situated deep in the mucous membrane, and these glands are found in the mucous membrane of the nose; similar glands of very minute form are found scattered thickly in the mucous membrane of the mouth, and are found of considerable size in the back part of the tongue, in the gullet, and other situations. But mucus is also produced by single epithelial cells, lining mucous membranes. The form of epithelial cell called the "goblet cell" is believed to be a mucous-secreting cell, and it is found in large numbers lining the mucous membrane of the air-passages, the stomach and bowels. So that by their agency the special digestive secretions of stomach and intestines contain a large mixture of mucous material. Pure mucus is transparent, but it is usually turbid from the presence of foreign materials, and epithelial cells from the secreting membrane. Its chief constituent is mucin, a derivative from albumin-bodies, consisting of carbon, hydrogen, oxygen and nitrogen, but, unlike albumin, containing no sulphur. It is held in suspension by water, forming an opaque liquid, but is not dissolved by it. Besides mucin, mucus contains small quantities of proteid substances and salts, chiefly common salt. Water constitutes nearly 90 per cent of its bulk. From fluids containing mucus in suspension, such as bile, it may be precipitated in a flocculent stringy mass by alcohol. It does not coagulate it; and it is dissolved in weak solutions of alkalies and alkaline salts.

MUD (or PEAT) BATH, in which the body is immersed in mud or peat. At Eger, Bohemia, the mud is heated to a temperature of 100°. It contains sulphate of soda, iron, lime, soda and ulmic acid. The body is immersed for 15 minutes, after which the patient goes to water to remove the mud. Such a bath may be of use in chronic skin diseases, rheumatism, gout, etc.

MUD-BUFFALO, a name, in the leather trade, for the Indian buffalo (*Bos bubalus*) as found in a wild or semi-wild condition in the Malay Peninsula, where they frequent swamps and are shot for the sake of their hides. These hides are not tanned, but are sent green to India, Europe and America to be used in the making of loom-pickers, mallets, gears and other tools used in cotton-milling. They become harder than wood, and are tougher and more elastic.

MUD-CAT. See **CATFISH**.

MUD CRACKS, cracks formed in mud surfaces by shrinkage due to drying. The surface of the mud flat is usually broken up into polygonal blocks, by cracks varying from a few inches to several feet in depth. These are also known as sun cracks, and are commonly formed in the muds of flood plains and deltas, and on playa (q.v.) surfaces. They are often filled with drifting sand and preserved in the sediment as the rock solidifies. For a discussion of their geological significance, see the section on *Structure*, in the article on **GEOLOGY**.

MUD-EEL, the amphibian *Siren lacertina*, which has persistent gills but no hind legs. It resembles the *Proteidae* (q.v.) in many ways. See **SIRENIDÆ**.

MUD-FISH, the name of various fishes found in muddy water, or fond of burrowing in the ooze of swamps. The Nile bichir and its relatives, the reed-fishes of the sluggish African rivers, are so called; also the lepidosiren and other dipnoans, which grovel on muddy bottoms. In the United States, the name belongs to some small mud-minnows (q.v.), and to a curious fish (*Amia calva*) of the Mississippi Valley, known as dogfish, bowfin and by various other names. This, like the bichir and the reed-fish, is a ganoid (q.v.). It is a rather shapeless, dark-colored, exceedingly hardy fish, reaching a length of two feet and a dozen pounds in weight. It is carnivorous, feeding voraciously upon crayfish, small mollusks and anything it is able to seize and swallow; and it greedily seizes a baited hook and then fights gamely for its life, so that it is a favorite with anglers, though hardly fit to eat.

MUD-HEN, or **MARSH-HEN**, a sportsman's name for any of several rails, gallinules, coots and similar birds which make their home in marshes; it is most often given in the North to the Gallinule (*Gallinula galeata*), a bird of the rail family, much like the British water-hen (*G. chloropus*), and common in the marshes about the Great Lakes and Mississippi Valley, where its cluckings resound in summer from every reedy marsh. It is about a foot in length, olive-brown on the back, dull black on the under parts and with a red bill. It is migratory; but the Southern States have a smaller and more handsome mud-hen in the resident purple gallinule (*Poronornis martinica*).

MUD-MINNOW, or **DOGFISH**, one of the smaller fresh-water carnivorous fishes of the pike family, the *Esocidae* and the genus *Umbra* related to the Alaskan blackfish (*Dallia*). It lives in muddy bayous, and among weeds at the bottom of clear but sluggish streams, often burrowing in loose mud. There are two North American species: *Umbra limi* of the interior, and *U. pygmaea* of the eastern coast; and one in Austria. Such a distribution increases the probability that this is of "an archaic type, characteristic of some earlier fish-fauna." The mud-minnows reach a length of about four inches and are valued as live bait, since they will long endure with vigor impalement on the hook.

MUD-PUPPY, or **WATER-DOG**, a member of the *Proteidae* (q.v.). In this country usually *Necturus maculatus*, a large newt common in the eastern Mississippi Basin. For its

development and metamorphoses, see EMBRY-
OLOGY.

MUD-SHAD (*Dorosoma cepedianum*), the hickory or gizzard shad. This fish grows to a length of about 15 inches, is silvery blue in color, and occurs throughout the Mississippi Valley and in great abundance from Cape Cod to Mexico.

MUD-SKIPPER, a minute tropical fish of the goby family and genus *Periophthalmus*, which is accustomed to go ashore and skip about the space between tide-marks, exploring the rocks, roots of trees, etc., for food, and skipping about like grasshoppers. Some curious qualities distinguish these little creatures, which are found from West Africa to Japan, and make them highly interesting to naturalists. Consult Day's 'Fishes of India' (1878) and other works on the natural history of the Eastern seas.

MUD-TURTLE, or **MUD-TORTOISE**, any fresh-water turtle usually found in muddy places. In the United States, the ordinary mud-turtle is *Cinosternon pennsylvanicum*, which has a grayish-brown smooth shell, and a dark-colored head, with light dots. See BOX-TURTLE.

MUD-WASP, one of the many kinds of solitary wasps which fabricate out of wet clay cell-like receptacles, variously shaped and placed, in which to store their eggs and the provision for the larvæ. See WASP.

MUDDOCK, Joyce Emmerson, English journalist and author: b. Southampton, England, 28 May 1843. He has been connected with several London journals and beside publishing some 52 volumes under the *nom de guerre* of "DICK DONOVAN" is the author of many other works, among which are 'Basile the Jester'; 'The Great White Hand'; 'Fair Rosalind,' and 'Pages from an Adventurous Life.'

MUDGE, Enoch, American Methodist clergyman: b. Lynn, Mass., 28 June 1776; d. 2 April 1850; the first Methodist clergyman reared in New England. He became an itinerant clergyman of the Methodist Church in 1793, and in 1793-99 traveled on his duties about Maine until hardships affected his health, and he was settled at Orrington (1799-1816). During this period he was twice elected to the legislature, where he obtained the repeal of a law imposing a tax on other denominations for the benefit of the Congregationalists. Having resumed itineracy in 1816, he was stationed at Boston, Lynn, Portsmouth, Newport and other places. From 1832 until his retirement from active life in 1844, he was pastor of the Seamen's Chapel at New Bedford. He was a member of the Massachusetts Constitutional Convention in 1819. He contributed much to the press, and published in bookform 'Camp-Meeting Hymn-Book' (1818); 'Notes on the Parables' (1828); 'Lynn,' in verse (1830), and 'Lectures to Seamen' (1836).

MUDIR, moo-dër', the title of a Turkish or Egyptian official: the governor of a province.

MUEZZIN, mü-ëz'in, in Mohammedan countries the beadle of the mosque, whose duty it is to summon the faithful to prayer at the assigned periods by public proclamation from the minaret (q.v.). His call is the *azan*, and

is sounded five times each day. The call: "God is most great [four times]! I bear witness that there is no god but one God [twice]! bear witness Mohammed is the apostle of God [twice]! Come to prayer [twice]! Come to salvation [twice]! God is most great [twice]! There is no god but God [twice]!" In the morning call the words "Come to salvation" "Prayer is better than sleep!" are repeated twice.

MUFTI, the title of a high Turkish official who assists the judge or *cadi* by interpreting the law of the Koran, of Moslem tradition and of other legal sources. The Grand Mufti (Sheikh-ul-Islam (see SHEIK) is one of the interpreters of the Koran, by whose decision the *cadis* have to judge. The phrase, "in mufti" meaning, "not in uniform; in civilian dress," an Anglo-Indian expression, referring to the loose robes of the Moslem mufti.

MUGGER. See MARSH-CROCODILE.

MUGGLETONIANS, a religious sect founded (1610) by Lodowicke Muggleton in London. He claimed that he and his cousin John Reeve, a tailor like himself, were the two witnesses who should "prophesy a thousand two hundred and three score days, clothed in sack cloth" (Rev. xi, 3). He was 40 years old when he received this commission through visions and mysterious voices. 'The Divine Looking Glass' (1656) contains an exposition of the teaching of the Muggletonians who deny the doctrine of the Trinity and believe in a material God, who suffered on the cross. Penn's 'The New Witnesses proved old Heretics' (1672) was a reply to the attacks of Muggleton. This Muggletonian bible was republished 1846 by a few remaining adherents of the sect. Consult Jessopp, A., 'The Coming of the Friars' (1888).

MUGWORT, an ornamental and culinary herb. See ARTEMISIA.

MUGWUMP, in American politics, a term originating during the Presidential campaign of 1884 between Grover Cleveland and James G. Blaine. It was applied by a New York newspaper to such members of the Republican party as refused to support their party nominee, James G. Blaine, and advocated the election of Grover Cleveland in the interest, they claimed of civil service reform. The word belongs to the Algonquin dialect of the Indian languages and is used by John Eliot in his translation of the Bible to translate the Hebrew word *Alluph*, "leader." Eliot used it in the sense of "chief," a term more comprehensible to the Indian mind than that which appears in the King James' version—"duke." The word was spelled "Mugquomp" in the singular, and "Mugquompaog" in the plural. It appears in many places throughout the Algonquin translation of the Old Testament.

MUHARRAM, (Ar. *muharram*, sacred from *harama*, to forbid), moo-hâr'am, the first month in the Mohammedan year. The tenth day is known as the day of Ashura, and was originally made by Mohammed the great fast of the year, in imitation of the Jewish Day of Atonement, which is celebrated on the tenth day after New Year's Festival. Later on this came to be replaced by the first month of Ramadan. Nowadays among Sunnites the day of Ashura is only a voluntary

fast. The Shutes mourn on this day in memory of the martyrdom of Husein (q.v.) at Kerbela.

MÜHLBACH, mül'bäh, Luise. See MÜNDT, KLARA.

MÜHLBERG, mül'bérk, Germany, town in Prussian Saxony, eight miles from the city of Riesa. Mühlberg is located on the Elbe, has two Evangelical churches, court of justice, inland-revenue office, etc. Its industries consist of a sugar factory, saw-mills, brick kilns, besides commerce in lumber and grain and shipping. It is noted in history through the victory of Emperor Charles V over John Frederick, Elector of Saxony, in 1547. Pop. 3,345.

MUHLEMAN, mül'man, Maurice Louis, American author: b. near Alton Ill., 27 Nov. 1852; d. 12 June 1913. He was graduated from the law school of Columbia University in 1879 and was appointed to the United States treasury service in 1872. In 1888-1901 he was deputy assistant treasurer of the United States. He has published 'The Money of the United States' (1894); 'Monetary Systems of the World' (1896); 'Treasury System of the United States' (1907); 'Banking Systems of the World' (1908); 'A Plan for a Central Bank' (1910); 'Governmental Supervision of Banks' (1911).

MÜHLENBERG, mü'lén-berg, Frederick Augustus Conrad, American Lutheran clergyman and politician; son of Heinrich Melchior Muhlenberg (q.v.): b. Trappe, Pa., 1 Jan. 1750; d. Lancaster, Pa., 4 June 1801. He was educated in Halle, Germany, and returning in 1770 was ordained to the Lutheran ministry. In 1773-76 he had charge of a Lutheran church in New York and then removed to Pennsylvania where he held several pastoral charges. He was a hearty sympathizer with the cause of the colonies and though not participating in the war aided his countrymen politically and ultimately abandoned his pastoral work for a political life. He served in the Continental Congress and was speaker of the first House of Representatives under Washington, and in 1795 he was the deciding vote which rescued the Jay treaty from defeat.

MÜHLENBERG, Gotthilf Henry Ernst, American Lutheran clergyman and botanist: b. Trappe, Pa., 17 Nov. 1753; d. Lancaster, Pa., 23 May 1815. He was a brother of F. A. C. Muhlenberg and son of Heinrich Melchior Muhlenberg (qq.v.), and was educated with him in Halle, Germany. He returned to America in 1770, was ordained to the ministry and became an assistant to his father who was in charge of a Lutheran church in Philadelphia. He served in various charges until 1779 when he accepted a call to Lancaster where he remained until his death. In addition to his pastoral duties he distinguished himself as a scientist and took first rank as a botanist. He published 'Catalogus Plantarum Americae Septentrionalis' (1813); 'Descriptio Ueberior Graminum' (1817), etc.

MÜHLENBERG, Heinrich Melchior, German-American clergyman, organizer of the Evangelical Lutheran Church in America: b. Embleck, Hanover, 6 Sept. 1711; d. New Providence (now Trappe), Montgomery County, Pa., 7 Oct. 1787. He was educated at the University of Göttingen (1735-37), studied theology

there (1737-38) and at Halle (1738-39), was ordained in 1739, and from 1739 to 1741 was deacon of the church at Grosshennersdorf, Upper Lusatia. On 6 Sept. 1741 he was called as missionary to the Lutheran congregations of Pennsylvania, located at Philadelphia, New Providence (now Trappe), and New Hanover. At that time there was a large number of Lutherans in America; but they were unorganized and without pastors, and such religious meetings as they had were conducted by laymen. Muhlenberg, who arrived at Charleston, S. C., 22 Sept. 1742 and at Philadelphia, 25 November, was well qualified for the work of effecting union and order. He at once entered on the duties of his charge, and preached his first sermon in Pennsylvania in an unfinished log-building at New Hanover, 28 November. Though Muhlenberg's local pastorship was largely restricted to the three congregations which had summoned him, his activities were really those of a bishop. He traveled over a wide extent of territory, preached at Lancaster, York and other places in Pennsylvania, in New York, and also occasionally in New Jersey, Maryland and among the Salzburger Lutherans of Georgia. "There was probably," thinks Stoeber, "not a Lutheran church, in his day, in this country in which he had not officiated." He was at first looked upon as an intruder by Zinzendorf and other Moravians, with whom he was for a time involved in conflict. But so successful was he in his labors that by 1745 there was real need for the reinforcement from Halle, consisting of the Rev. Peter Brunnholtz and the catechists Kurtz and Schaum. The first church edifice at Philadelphia, Saint Michael's, was completed in 1743, and on 25 June 1769 Zion's Church, then considered the largest and finest in the United States, was dedicated there. On 14 Aug. 1748 the first Lutheran synod in America was organized under the direction of Muhlenberg, who became its president. In 1754 Muhlenberg prepared the 'Kirchen Agende,' a directory for public worship, and in 1762 reorganized the Philadelphia congregation under a constitution which became the basis of that of most congregations later established. He identified himself with the American cause in the Revolution, and was in consequence subjected to many annoyances, particularly when Pennsylvania was the scene of war (1777-78). He was a linguist of high rank, versed in Hebrew, Greek and Latin (in which he made an address at the synod of 1750), and proficient in English, Dutch, French, Bohemian and Swedish. His large foreign correspondence appeared at Halle in 1787. Consult 'Die erlaubte Klage über den Abschied treuer Knechte Gottes' (1788), a memorial sermon by J. H. C. Helmuth (with biographical sketch); Stoeber, 'Memoir of the Life and Times of Muhlenberg' (1856); Mann, 'Life and Times' (1887), considered the best.

MÜHLENBERG, John Peter Gabriel, American patriot: b. Trappe (then New Providence), Montgomery County, Pa., 1 Oct. 1746; d. near Philadelphia, 1 Oct. 1807. He was the son of H. M. Muhlenberg (q.v.), the founder of the German Lutheran Church in America. He was educated for the ministry, was for a time pastor of German Lutheran churches at New Germantown, N. J., and Bedminster, N. J. In 1772 he went to Woodstock, Va., and

finding that, in order to enforce the payment of tithes, he must be ordained in the Episcopal Church, he was ordained priest in England. He was chairman of the Shenandoah County committee of safety, and in 1774 became a member of the Virginia House of Burgesses. At Washington's request he was made a colonel in the Continental Army. His last sermon was upon the duties men owe their country; and saying, "There is a time for all things—a time to preach and a time to fight—and now is the time to fight," he stripped off his gown after the service, appeared in full uniform, called for recruits and enrolled about 300 of the parishioners. He participated in several battles, was made brigadier general in 1777, and major general at the close of the Revolution. After the war he removed to Pennsylvania, where he was elected a member of the supreme executive council, and in 1785 became vice president of Pennsylvania. He served as representative in Congress from 1789 to 1795, and from 1799 to 1801. In 1801 he was elected United States senator, but soon resigned and was appointed supervisor of revenue for Philadelphia. From 1802 till his death he held the office of collector of the port of Philadelphia.

MUHLBERG, William Augustus, American clergyman: b. Philadelphia, Sept. 16, 1796; d. New York, April 8, 1877. He was graduated (1815) at the University of Pennsylvania and was ordained deacon (1817) of the Episcopal Church and priest three years later, becoming assistant to the rector, Bishop White, of St. Peters and St. James parishes. In 1821 he went to Lancaster, Pa., becoming rector of St. James Church and established there the first public school in the state outside of Philadelphia. He went to Flushing, L. I. (1826), and founded a Christian high school (1828, later St. Paul's College), he remained principal till 1846, when he was appointed rector of the Church of the Holy Communion, New York City, erected by his sister. He started collecting a fund for the erection of a church hospital out of which St. Luke's Hospital was built (1858) on 54th Street between Fifth and Sixth avenues, and he became its first pastor and superintendent, which positions he held till his death. His last very useful work was in founding St. Johnland Christian industrial community on the north shore of Long Island. In 1852 he organized the first Protestant sisterhood in the United States. He wrote several well-known hymns including *I Would Not Live Alway; Like Noah's Weary Dove; Shout the Glad Tidings*. His chief works published are *Evangelical Catholic Papers*, 2 vols. (1875-1877); *Christian Education* (1831). Consult, Ayres, *Sister Anne, Life and Work of William Augustus Muhlenberg* (New York 1880).

MUHLBERG COLLEGE, in Allentown, Pa., founded in 1848 under the auspices of the Lutheran Church. In 1946 there were connected with the college 85 professors and instructors, and about 786 pupils. There were in the library 70,000 volumes.

MUHLHAUSEN, mül'hou-zën, France, a town of Alsace-Lorraine. See **MULHOUSE** (German Mülhausen).

MUHLHAUSEN, Germany, town of Thuringen, in a fertile district on the Unstrut, 29 miles

northwest of Erfurt. It has two interesting old churches, an old town-house, a gymnasium, various technical, commercial and other schools, hospitals, an orphanage, etc. It manufactures woolen and cotton or mixed goods, hosiery, cigars, leather, sewing-machines, wooden wares, furniture; and carries on tanning, dyeing, malting, brewing, etc. The Anabaptist Thomas Münzer, a leader in the Peasants' War, had his headquarters here, and was executed nearby in 1525. The town became part of the Kingdom of Prussia in 1815. Pop. (1939) 44,398.

MUHLHEIM, mül'him. See **MÜLHEIM**

MUIR, mür, John, Scottish Sanskrit scholar. b. Glasgow, Feb. 5, 1810; d. Edinburgh, March 7, 1882. He was educated at Glasgow University and at Haileybury College, whence he passed into the Bengal Civil Service in 1829. He remained in India 25 years, filling various offices in the revenue, educational and judicial departments. His fame will rest on his *Original Sanskrit Texts on the Origin and History of the People of India, their Religion and Institutions*, illustrated (1858-1870). The first volume discusses the legendary accounts of the origin of caste; the second, the primitive homes of the Hindu; the third, the opinions of Hindu writers on the Vedas; the fourth, the contrast between Vedic and later Hindu theology; and the last the cosmological and mythological conceptions of the Indians in the Vedic age. In 1862 he founded a chair of Sanskrit and comparative philology in the University of Edinburgh, following out the plans of the Association for the Better Endowment of Edinburgh University, of which he was the main originator.

MUIR, John, American naturalist and explorer: b. Dunbar, Scotland, April 21, 1838. d. Los Angeles, Dec. 24, 1914. He came to America in 1849 with his father, who settled near Fox River, Wis.; entered the University of Wisconsin when 21; and after a special course of four years commenced his lonely journeys through Canada, eastern and western United States, the West, and the South, that made him a botanist and a geologist. In 1868 after visiting the Yosemite Valley, he made it his main central camp for 6 years while studying the forests, glaciers, etc., of the Sierra Nevada. He discovered in the High Sierra 65 residual glaciers. He made his first trip to Alaska in 1879, discovered Glacier Bay, and Muir Glacier, named after him, and explored some of the upper courses of the Yukon and Mackenzie rivers; in 1880 accompanied the DeLong search expedition to the Arctic, and in 1903-1904 traveled in the Caucasus, Siberia, Manchuria, Japan, India, Egypt, Australia and New Zealand. He wrote much for newspapers and periodicals, urging the formation of national parks—both the Sequoia and Yosemite are in great part due to his efforts—and published *The Mountains of California* (1894), and *Our National Parks* (1901). He was a member of the American Academy of Arts and Letters, and received honorary degrees at Yale and the universities of Wisconsin and California. Among his works are *Stickeen* (1909); *My First Summer in the Sierra* (1911); *The Yosemite* (1912); *Story of my Boyhood and Youth* (1913); and the

posthumous *Letters to a Friend and Unpublished Prose and Letters* (1915).

MUIR, Sir William, Scottish administrator and Arabic scholar: b. Glasgow, April 27, 1819; d. July 11, 1905. He attended lectures at the universities of Edinburgh and Glasgow and at 18 entered the Bengal civil service, where he attained distinction. He became secretary of the government of the North-West Provinces and member of the Revenue Board, and during the mutiny was in charge of the Intelligence Department at Agra. He was lieutenant governor of the North-West Provinces 1868-1874, and financial minister to the government of India 1874-1876. Returning to England he sat on the Council of India, 1876-1885, was elected principal of the University of Edinburgh, 1885-1905. His published works included: *Life of Mohamet* (1858 and 1877); *The Coran: Its Composition and Teachings* (1877); "Ancient Arabic Poetry," *Royal Asiatic Society's Journal* (1879); *The Early Caliphate and Rise of Islam* (1881); *Annals of the Early Caliphate* (1883); *The Old and New Testaments, Tourat, Zubur and Gospel* (1899).

MUKDEN (SHENYANG, earlier FUNG-ANNU), capital of the original Manchurian Province of Liaoning (q.v.) and of the new province of that name, created in 1945. It is on the Hun River (a tributary of the Liao), about 500 miles northeast of Peiping. Mukden is the original home of the Manchus, and is a miniature Peiping. The city proper, which is laid out in regular blocks, is surrounded by a wall of squared stone or brick, thick and massive at the base and tapering to the top, surrounded by a wide moat. Suburbs, including the modern New City, extend beyond the wall for a mile or more on all sides. In the heart of the city there is an inner wall, three miles in circuit, enclosing the imperial residence, government offices, courts, and other buildings connected with them, which are arranged on a plan similar to those in Peiping. In 1631 the Manchu monarchs made Mukden the seat of government, and succeeding emperors did much to enlarge and beautify it. The tombs of the Manchu emperors are at Mukden. Other interesting relics, remains of which are still to be seen in the environs of the city, are the Temple of Heaven and the Temple of Earth, both built by Emperor Tai Tsung (r. 1636-1643). After the building of railways in Manchuria by the Russians, Japanese, and Chinese, Mukden became a strategic center in south Manchuria. During the Russo-Japanese War, Mukden, used by the Russian Army as a base of supplies, was captured by the Japanese in one of the most remarkable battles of modern history. After the defeat of Russia, the Japanese established their sphere of influence in south Manchuria, and Mukden became a base for Japanese penetration in China. A planned "incident" gave Japan an excuse for seizing the city, Sept. 18, 1931, starting aggressions that led to World War II. During the 14 years of Japanese occupation of Manchuria, Mukden was developed into one of the most important industrial centers in the Far East. It was estimated that there were over 3,000 Japanese factories in Mukden, investments in which equaled about half the total investments by the Japanese in their home industries, which

were rivaled in importance by those in Mukden. After the Soviet Army entered Mukden on Aug. 20, 1945, the Mukden plants were stripped by the USSR of their best equipment. When the Chinese national troops arrived in Mukden early in 1946, they found an empty industrial city. In May 1946, President and Madame Chiang Kai-shek paid a special visit to Mukden.

MUKHTAR PASHA, mookh-tār'pāsh'ā, (GHAZI AHMED), Turkish general and statesman: b. Brusa, September 1832; d. Constantinople, Jan. 21, 1919. He attended military schools in Brusa and Constantinople and entered the army. Serving in the Crimean War, he later taught in a military school and became the military instructor of Prince Yusuf Iseddin, favorite son of Sultan Abd-ul-Aziz, and was second in command of the expedition to Yemen in 1870, taking full command in 1871, and consequently being given the title of *müşir* (marshal). In the campaign of 1860 in Montenegro he played a conspicuous part and thereafter received steady and rapid promotion. He became a full general in 1870 and in 1873 was appointed minister of public works. In the wars of Bosnia, Herzegovina and Montenegro in which he commanded he displayed great generalship, gaining 20 victories and never suffering defeat. The campaign of Kars-Erzurum in 1877 went against him and he was defeated by the Russian general Melikoff after a brilliant engagement for which he received the highest Turkish military title, "Ghazi." In 1878 he was made grand master of the Turkish artillery, in which capacity he subdued the Cretan insurrection in that year, and in 1885 was designated to the post of Turkish high commissioner in Egypt. He remained there about 10 years, and then returned to Constantinople.

MULA, moo'la, Spain, town in the province of Murcia, on a branch of the Segura. It has ancient castle ruins, but is chiefly known on account of its iron and sulphur natural hot baths. Pop. about 9,632.

MULBERRY, a genus (*Morus*) of trees of the order Moraceae (q.v.), of which 100 species have been described, but only five are now recognized. The mulberries are characterized by the possession of leaves variable in form even upon the same twigs; monoecious flowers in axillary catkins; and multiple blackberry-like fruits formed by the coherence of the pistillate flowers which become fleshy as they swell. They are natives of the mild parts of Asia, Europe and America, whence they have been taken by man to similar regions throughout the world. In the Old World various species are of economic importance, principally because their foliage supplies the food of the silkworm, and their fruit a dessert and a wine. The wood of most species is of inferior quality, but that of one species, the red mulberry (*M. rubra*), is fine-grained, strong and useful for shipbuilding. The trees are readily propagated by means of seeds, layers, cuttings or by graftage. They thrive upon almost any soil; even on rocky hillsides and gravelly lands, but succeed best upon arable soil in which they may be planted from 20 to 40 feet apart, and cultivated like other orchard fruits until they have full possession of the ground. The fruits,

which are borne in great profusion, are too soft for market purposes, and usually too sweet for preserving alone. They are generally shaken from the trees upon sheets. Pigs are very fond of them.

The following are the most important species. The white mulberry (*M. alba*) is the silkworm mulberry, and has produced most of the named American varieties valued for their fruit, but not those esteemed in Europe. The black mulberry (*M. nigra*) is the European "dessert" species, and is little used for the feeding of silkworms. The red mulberry (*M. rubra*) is a native American tree to be found from Massachusetts to Nebraska and southward to the Gulf States. It has produced several good dessert varieties, the fruits, of which are characterized by greater acidity than those of the Old World sorts. It seems to be ill adapted to the feeding of silkworms. The so-called Russian mulberry is a variety of the white. It produces inferior fruits but is valued in the Plains States for wind-breaks, for which purpose its ability to resist extremes of drouth, cold and neglect specially fit it. All the above species have produced horticultural varieties, some variegated, others weeping, which are planted more for ornamental purposes than for fruit.

Another important species is the Indian (*M. indica*) which is used in silk culture and for its fruit, which is of fine flavor. It is cultivated in India, China and other countries of the East.

The allied paper-mulberry (*Broussonetia papyrifera*) is a native of Eastern Asia. This tree is of a moderate size, bearing leaves which are either simple or divided into lobes, more or less deep, rough above and hairy beneath. It was originally from India and Japan, but is now very commonly cultivated in Europe, and succeeds even in the more northern parts. The islanders of the Pacific make a kind of clothing from the bark of this tree in the following manner: Twigs of about an inch in diameter are cut and deprived of their bark, which is divided into strips, and left to macerate for some time in running water. After the epidermis has been scraped off, and while yet moist, the strips are laid out upon a plank in such a manner that they touch at the edges, and two or three layers of the same are then placed upon them, taking care to preserve an equal thickness throughout. At the end of 24 hours the whole mass is adherent, when it is removed to a large, flat and perfectly smooth table, and is beaten with little wooden clubs till it has attained the requisite thinness. This kind of cloth is easily torn, and requires to be washed and beaten many times before it acquires its full suppleness and whiteness. The natives dye it red and yellow, and also make a similar cloth from the bread-fruit tree, an allied plant; but that from the mulberry is preferred. The paper which is used in Japan and many other countries in the East Indies is made from this plant. For this purpose the annual shoots are cut after the fall of the leaves, tied in bundles, and boiled in water mixed with ashes; after which the bark is stripped off by longitudinal incisions, and deprived of the brown epidermis. The mark of the more tender shoots is separated from the rest, as it furnishes a white paper for writing, while that produced by the

remainder is coarse and gray, and serves for wrapping or similar purposes.

MULCH, any material kept in a loose condition at the surface of the soil for the purpose of checking evaporation, conserving moisture, protecting plant-roots or low-growing plants from frost or heat, preventing puddling and washing of the soil, retarding growth in spring, keeping the surface soil open, supplying plant-food, protecting fruit or flowers from dirt, and keeping down weeds. The materials most frequently applied are straw, marsh-hay, leaves, litter and brush; but the most widely important mulch is the surface soil itself, kept powdery by frequent tillage, given especially after rains when it is desirable to break the crust formed upon the surface. Since mulches keep the soil beneath them moist by breaking the capillary, they are of particular advantage in dry climates; but since the vegetable mulches, such as straw and leaves, cannot be used in summer where the land must be cultivated and since they supply hiding places for insects, they can rarely be used advantageously in fruit plantations, in which they are often also a positive detriment because they encourage the growth of roots near the surface. In climates liable to extremes of temperature this position of the feeding roots is often disastrous to the crop if not to the plants themselves. Except, therefore, for winter protection, when such seems to be necessary, the soil itself is generally best. But the depth of the powdery layer will depend largely upon the climate, character of the soil, and kind of crop; in arid regions, with light soils, and with deep-rooted plants, the soil-mulches are usually deeper than with the reverse conditions.

MULDER, mool'dër, **Gerardus Johannes**, Dutch chemist and physician: b. Utrecht, Holland, 27 Dec. 1802; d. there, April 1880. He was educated at the University of Utrecht and became professor of botany and chemistry there (1840-68), but first practised medicine in Amsterdam for some years. He was also for a short time professor of chemistry at Rotterdam. He became known chiefly through his researches on the proteids, and advanced the belief in a hypothetical substance which he called protein. This he believed to be the essential nitrogenous constituent of food, existing in animals, and derived ready-formed from plants and vegetables. The publication of this theory involved Mulder in a controversy with Liebig, who from the first doubted the existence of protein as an independent chemical compound. The whole theory has been abandoned, and the word protein is now used to indicate the first element in compounds. His principal work 'Chemistry of Vegetable and Animal Physiology' has been translated into English by Fromberg, and his 'Chemistry of Wine,' by Bence Jones. He also wrote 'Chemical Researches'; 'De Voeding in Nederland'; 'De Voeding van den Neger in Suriname,' and his posthumous autobiography 'Levensschets' (1881; 2d ed. 1883).

MULE, in zoology, a term loosely used as synonymous with hybrid, more usually applied to the produce of a male ass with a mare, the mule proper, and to the hinny, the offspring of a stallion and a she-ass. The mule does not

attain maturity as soon as the horse, but is useful a much longer period. As a beast of burden it is in some respects preferable to the horse; it is easily fed, is equally good for carrying and drawing, its less sensitive skin enables it to support exposure to the weather; like the ass, it enjoys comparative immunity from disease, and it is as surefooted as a goat. Mules have been known from the earliest ages; there are frequent references to them in Scripture and in Greek and Latin literature. Kentucky, Missouri and Kansas take the lead in mule-raising in the United States, and the small Mexican mule is a very useful animal. France is the most important mule-raising country in Europe; then come Italy, Spain and Portugal, where they are used for pack and draft. They are largely employed as draft animals in warfare. Fecundation of the hybrid-female by the male ass or the stallion is not very rare, though she rarely throws a living foal. Consult Fegetmeier, 'Horses, Asses and Zebras' (London, 1895), and publications of the United States Department of Agriculture. (See HYBRIDITY). In 1931 there were 5,131,000 mules in the United States, valued at \$351,994,000. The average value per head was \$68.60. For further statistics see DAIRY INDUSTRY, AMERICAN.

MULE DEER, or BLACKTAIL, a deer of the western United States (*Odocoileus hemionus*), remarkable for its disproportionately large ears. Its common name "blacktail" among the hunters is due to the black color of the terminal part of the tail, distinguishing it from the "whitetail" or eastern deer (q.v.); but is better reserved for the Pacific Coast species. (See BLACKTAIL). This deer is rather larger than the eastern one and is a deer of the rocky plains, and especially of the mountains, which it climbs in summer as high as it can go, pasturing upon alpine slopes and resting upon the summits of cliffs and ledges where it has a wide outlook. Its gait is very distinctive, also, consisting of a series of jerking bounds very effective on declivities, but looking strange on a level plain. The character of the sport afforded by this deer depends much upon the kind of country in which it is hunted, the method of pursuit being very different in the chaparral of southern California from that followed among the broken plains of Montana. When hiding in summer it will often wait until almost touched before starting off. In winter it gathers into herds and wanders among sheltering hills and vales. It is therefore the characteristic deer of the Rocky Mountain region and was formerly exceedingly numerous and one of the principal sources of food and clothing for the Indians. Originally the species occurred commonly as far east as the plains and prairies extended; but was early exterminated in the central Mississippi Valley; and from about 1875 to 1895 was the object of persistent slaughter by hide hunters. At the beginning of the present century, therefore, it had nearly disappeared from the plains south of the upper Missouri, was scarce in the central Rockies and numerous only in the less frequented parts of the Northwestern States and adjoining provinces of Canada. Its hide makes the best tanned deer-leather (buckskin) and its flesh is excellent. The mule deer is not much taller than the Virginian deer, standing about

three feet four inches high at the shoulder, but is heavier and of coarser build. The ears are very large and thickly haired, the tail roundish and white with black tip. The coat is dull yellowish in summer, palest in the southern desert varieties, but becomes bluish gray with the autumnal molt; face between the eyes dusky, elsewhere white; throat, abdomen and inside of the legs white; antlers forking equally and each prong again bifurcating. Consult Baillie-Grohman, 'Fifteen Years' Sport and Life in the Hunting Grounds of Western America' (1900); Caton, 'Antelope and Deer of America' (1877); Lydekker, 'Deer of all Lands' (1898); Roosevelt (and others), 'The Deer Family' (1902).

MULE-KILLER. See MANTIS.

MULE MACHINE, a spinning-machine in which the rovings are delivered from a series of sets of drawing rollers to spindles placed on a carriage, which travels away from the rollers while the thread is being twisted and returns toward the rollers while the thread is being wound. It was invented by Samuel Crompton, of Bolton, England, and perfected in 1779. The combination which gave rise to the term mule was the junction of the drawing rollers of Arkwright with the spinning jenny of Hargreaves. The object of the machine is to deliver the roving with the required degree of attenuation and twist it as delivered. For this purpose the spindles, instead of being stationary, are placed on a movable carriage which is wheeled out to twist the threads and wheeled in again to wind on the spindles.

MULE AS A WORK ANIMAL, The. The use of mules for doing the work of the world is almost as old as history. The historical records that have come down to us recounting the exploits and industrial achievements of the more civilized peoples of the earth have all mentioned the mule. The impression which one gathers from reading the opinions of the earlier peoples is that the mule was highly regarded, particularly as a burden bearer.

So far as the writer has been able to determine, there are no unfavorable reports of the work of mules. On the other hand the unanimous opinion of those who have had most to do with the utilization of mules is that they are in many respects the most efficient and satisfactory work animals employed by mankind.

In more modern history the evidence of the value of mules is still more thoroughly recognized. The number of mules in the United States has increased rapidly. One hundred years ago the mule was not generally used as a draft animal except in a few Southern States. At the present time the mule is used to a greater or less extent in every State of the Union. He is particularly valued in the South, in the Middle West and the West. In these great agricultural regions the mule has won a place in competition with horses and he will not be replaced unless we should ultimately come to a type of farm practice which will make it possible to employ mechanical motors exclusively for agricultural production.

The favorable opinion of mules as work animals is not due to any accident nor indeed to any peculiar psychology of those who have used the mule largely in their industrial occu-

pations. There are certain outstanding qualities characteristic of the mule which single him out from among other types of draft animals and have made him what he is to-day—undoubtedly one of the most popular and economical of draft animals.

The mule is recognized as possessing unusual endurance, exceptional courage, sure-footedness, steadiness and is exceptionally free from excitability and harmful nervousness. The mule is also given credit for the possession of an unusual amount of instinctive wisdom which protects him against many of the dangers and accidents to which horses are subject.

No draft animal so far developed has the endurance of the mule under all kinds of hard working conditions. In the excessive hot climate of the tropics mules will work steadily day after day without injury to themselves and will accomplish an astonishingly large amount of productive labor. Under similar conditions horses are far less efficient and indeed it is plain that under many such conditions horses are entirely unable to accomplish the work. On the arid plains and in the desert regions of the world the endurance of the mule has been recognized and particularly where the trails are rocky the mule outlasts any other draft animal.

A part of the endurance of the mule is due to his temperament, a part to his sound, thoroughly good feet and a part to his instinctive food habits. The mule is not so well adapted to the sandy stretches of the arid regions because his small, somewhat pointed foot causes him to sink more deeply into the sand than flat-footed horses. The mule is sure-footed. Over the dangerous trails of the mountains the mule rarely meets with an accident. He is wise in selecting his foothold and will carry the rider or pack safely along precipitous trails where under similar conditions horses would be unsatisfactory.

On the farms, particularly of the Middle West and the South, the mule is more economical. The statement is frequently made that the mule requires less food for the performance of a given amount of work than the horse. This is the general opinion among farmers experienced in the use of mules. Investigations on this point are not numerous and are not thoroughly convincing, but in the main the conclusion that mules will consume less food than horses is probably true. It is certainly true that mules will thrive on a coarser character of fodder. They will thrive under conditions which would be impossible for horses.

The mule will rarely if ever injure himself by over-heating, over-eating or drinking when he is too hot. Under similar conditions horses are frequently injured and their usefulness greatly diminished.

This interesting hybrid, descended from the ancient wild ass of the deserts, has inherited a certain type of wisdom which protects him from the dangers incident to civilization. The mule avoids accidents. On the farms of Missouri where mules attain their highest development the risk from rearing young mules, so far as acquiring blemishes is concerned, is much smaller than the risks from similar accidents among young horses. This is an economic factor which is clearly recognized and one which constitutes an argument for the increased profit

in the raising of mules. In the earlier use of mules in this country the small, active, hardy mule of good quality was universally favored. In more recent years with the larger use of heavy farm machinery, larger mules have been in demand. At the present time (1919) the large draft mule of good quality sells for the highest price on the market. The draft mules are not only used in the cities for heavy hauling but farmers also now more often demand the heavy mule than in former years. The smaller mules, known on the market as "cotton" mules, are more generally sold in the South. The draft mules are sold in the mining regions, for city drayage and on larger farms of the Middle West. The "sugar" mule is a larger mule than the "cotton" mule and is demanded in the cane-growing regions of the South. The demand for large draft mules has caused the breeders of jacks and jennets to produce a large jack of good quality. This animal mated to the mares belonging to the principal draft breeds of the United States is the source of the draft mules of America. These draft mules may perhaps lack somewhat in quality as compared with the smaller, more active mules of earlier history but they do possess a power and efficiency in the hauling of heavy loads which is comparable to the similar power of great draft horses so long used on the city streets.

This brief article on the value of the mule as a work animal would not be complete without recognizing the great value of the mule in war. During the great European War the Allies made large use of the mule in transporting artillery and supplies, particularly in carrying supplies to the front. The mule because of his courage and steady, reliable subservience was dependable under fire and could be used where horses could not be employed.

The rearing of mules has come to be as much an art based upon scientific principles of breeding as has the production of any other class of domestic animals. While it is true that the mule is a hybrid and always sterile, the principles of breeding which may be applied in his production are more complicated and involve the successful breeding of two distinct species, it is nevertheless true that the value of the mule for industrial purposes is to-day as largely dependent upon the skill of the breeder as is the breeding of cattle, horses, sheep or swine.

FREDERICK B. MUMFORD,

Dean and Director of the College of Agriculture, University of Missouri.

MULFORD, Elisha, American Episcopal clergyman and philosophical writer: b. Montrose, Pa., 10 Nov. 1833; d. Cambridge, Mass., 9 Dec. 1885. He was graduated from Yale in 1855 and subsequently studied theology, law and philosophy. He entered the Episcopal ministry and held several rectorates, but from 1881 lived in Cambridge, Mass. He wrote 'The Nation' (1870), a treatise on the philosophy of the State, and 'The Republic of God' (1881), relating to the philosophy of religion. From 1881 till his death he taught at the Episcopal Theological School at Cambridge, Mass.

MULHALL, Michael George, Irish statistician: b. Dublin, Ireland, 1836; d. Killiney, Ireland, 12 Dec. 1900. He was educated in the

Irish College at Rome, and in 1861 went to Buenos Aires, where he founded the *Standard*, the first English daily paper in South America. He gained a wide reputation as a statistician, and in 1880 made a calculation of the census of the United States for 1900 which came within 95,000 of the number given by the census report in that year. He was a frequent contributor to the *Contemporary Review*, and published *Rio Grande do Sul and Its German Colonies* (1873); *A Dictionary of Statistics* (1883); *Fifty Years of National Progress, 1837-87* (1887); *Industries and Wealth of Nations* (1896). His wife, MRS. MARION MULHALL, wrote *Between the Amazon and the Andes* (1883); *Celtic Sources of Dante's Divine Comedy*.

MULHEIM, mül'him, Prussia, two towns of the Rhineland area: (1) Mülheim-am-Rhine, with a bridge spanning the river, is almost opposite Cologne with which it was incorporated in 1914. During the 17th century the town received many expelled Protestants from Cologne. The town's manufactures include machinery, cables, velvet, and chemicals. (2) Mülheim-an-der-Ruhr is 14 miles north of Düsseldorf. The city is located on the Ruhr, a tributary of the Rhine, and has coal and iron mines, blast furnaces, rolling mills, foundries, and engine works. While its chief industry is ironmaking, it also manufactures leather, beer, paper, and tobacco. One of its churches, St. Peter's, dates from about the 12th century. Pop. (1939) 136,805.

MULHOLLAND, mül'höll'änd, William, American hydraulic engineer: b. Belfast, Ireland, Sept. 11, 1855; d. Los Angeles, Calif., July 22, 1935. He was educated at the Christian Brothers' School, Dublin. Coming to the United States, he became superintendent and chief engineer of the waterworks of Los Angeles, Calif., from 1886. He devised the plans and estimates, then superintended the construction of the Los Angeles aqueduct to bring to the city water from Sierra Nevada Mountains, a distance of about 250 miles, at a cost of \$24,500,000. He had been consulting engineer on many projected water supply and irrigation plants.

MULHOUSE, mü'lōōz', (German, MÜLHAUSEN or MUHLHAUSEN), France, a town of Alsace-Lorraine, on the Ill River and the Rhine-Rhône Canal, 66 miles by rail southwest of Strasbourg, and 18 miles northwest of Basel, Switzerland. It is an important commercial and manufacturing center, cotton-spinning being one of the largest industries. The town carries on calico printing, dyeing, the spinning of woolen and worsted yarn, the manufacture of machinery, railway material and numerous other industries. Its industrial importance dates from 1746, when a cotton factory was established. It is noted for its model dwellings for the working classes in the *cité ouvrière*, workingmen's colony, on the northwest, founded by Mayor Dollfus in 1853. A migration to the suburbs, however, left the artisan colony in the occupation of small tradesmen. Mülhausen is first mentioned in 717; it became an imperial free city in 1273, and in the 15th century entered into an alliance with the Swiss, which lasted till 1798, when it became French. It was included in the cession of Alsace to Germany in 1871. In

World War I it was the scene of considerable military activity. In 1918 it reverted to France. Pop. 1936, 96,011.

MULITA, a small armadillo, with head and ears like those of a mule, native to southern South America.

MULL, Scotland, an island of Argyllshire, the largest of the Inner Hebrides next to Skye. Its length is 35 miles; greatest breadth, 30; superficial area, 347 square miles. It is irregular in shape, and the large bay on the west side contains a number of islands, including Ulva and Staffa. Iona lies off its southwest extremity.

The island is rugged and mountainous; Benmore, the highest mountain, is over 3,000 feet above the level of the sea. The principal town is Tobermory; other villages include Salen and Lochbuie. Pop. (1931) 2,903.

MULLANY, mül-lä'nī, James Robert Madison, American naval officer: b. New York, Oct. 26, 1818; d. Bryn Mawr, Pa., Sept. 17, 1887. He was appointed to the navy as midshipman in 1832 and received steady promotion, becoming lieutenant in 1844. He served with distinction in the Mexican War, and at the outbreak of the Civil War in 1861 was promoted commander. He commanded the *Onesida* in the Battle of Mobile Bay and performed valiant service with her on that occasion, losing his left arm.

He was commissioned commodore in 1870 and rear admiral in 1874, and until 1876 was in command of the North Atlantic squadron, and in conjunction with General Emory and General Sheridan at New Orleans protected American interests on the Isthmus of Panama. From 1876 until 1879, when he was retired from active service, he was governor of the naval station at Philadelphia.

MULLEIN, a genus of biennial and perennial herbs (*Verbascum*) of the natural order Scrophulariaceae. The species, of which more than 100 have been described and more than 30 are cultivated, have tap roots, woolly foliage in rosettes during the first year, and terminal spikes or racemes of small, usually yellow, flowers which appear from midsummer until late autumn. Some species were formerly reputed medicinal. In America they are usually considered as weeds, but in Europe they are valued as ornamental plants, particularly for mixing with shrubbery and planting in the rear of flower borders. Though natives of the Mediterranean region, some species are known in England as American flannel or velvet plant. The best-known species in the United States are probably the moth mullein (*V. blattaria*), the common mullein (*V. thapsus*), the white mullein (*V. lychnitis*), and *V. phlomoides*.

MÜLLER, mü'l'ër, Adam Heinrich, German economist: b. Berlin, 1779; d. 1829. In his 19th year he went to the University of Göttingen, where he at first occupied himself with theology and then became a student of jurisprudence, in which he was a pupil of Hugo. He afterward sought to complete his education by the private study of the natural sciences, which he had previously neglected.

He early formed a close intimacy with Friedrich Gentz, his elder by 15 years; and this connection exercised an important influence both on his material circumstances and his mental development in after life. The two men differed widely in character and in their fundamental principles, but agreed, at least in their later period, in their practical political aims, and the friendship was only terminated by death. Müller's relations with the Junker party and his co-operation with them in their opposition to Hardenberg's reforms made any public employment in Prussia impossible for him. In 1805 he was in Vienna, where he became a convert to Roman Catholicism, and through Gentz was brought into relations with Metternich, to whom he was useful in the preparation of state papers. In 1806-09 he was in Dresden, being occupied in the political education of Prince Bernhard of Saxe-Weimar. In 1813 he entered the Austrian service, and in 1815 accompanied the Allies to Paris. He was ennobled by the emperor in 1820. In 1827 he settled a second time in Vienna, and was employed in the state chancellery. He was one of the principal literary instruments of the reaction and took part in framing the Carlsbad resolutions. He was distinguished as a writer not only on politics and economics, but on literature and aesthetics. His principal work is his *'Elemente der Staatskunst'* (1809), which contains the substance of a course of lectures delivered at Dresden to statesmen and diplomatists. In political economy he represents a reaction against the doctrines of Adam Smith, whom, while he highly commends him in certain respects, he censures as presenting a one-sidedly material and individualistic conception of society, and as being too exclusively English in his views. Müller's leading idea is that of the organic unity and continuity of the state and of social institutions in general. Some of his higher tendencies, freed from much of their alloy, are reproduced in the writings of the historical school of German economists. Other works by Müller are *'Die Theorie der Staats-haushaltung und ihre Fortschritte in Deutschland und England seit Adam Smith'* (1812); *'Versuch einer neuen Theorie des Geldes'* (1816); *'Vermischte Schriften über Staat Philosophie und Kunst'* (2 vols., Vienna 1817); and *'Von der Nothwendigkeit einer theologischen Grundlage der gesammten Staatswissenschaften und der Staatswirthschaft insbesondere'* (1819). Consult biographical notice of Mischler in *'Allgemeine Deutsche Biographie.'*

MÜLLER, Charles Louis, French painter: b. Paris, 22 Dec. 1815; d. there, 10 Jan. 1892. He was the pupil of L. Cogniet, Baron Gros and others in the Ecole des Beaux-Arts, and in 1850 was made director of the manufactory of Gobelins tapestries. His fertility in the production of historic pictures and portraits was amazing. Among them are *'Heliogabalus'* (1841); *'Primavera'* (1846); *'May-day'*; *'Lady Macbeth'*; and his masterpiece, *'The Last Victims to the Reign of Terror'*; the last two being in the Luxembourg; *'Vive l'Empereur'* (1855); *'Marie Antoinette'* (1857); *'A Mass During the Reign of Terror'* (1863); *'The Madness of King Lear'* (1875); *'Mater Dolorosa'* (1877). He executed the frescoes of the Salle d'Etat in the Louvre, and

as a painter is more to be commended for clever drawing and composition than for his somewhat flat and mediocre coloring. In 1864 he became a member of the Institute.

MÜLLER, Friedrich, called "Maler Müller," or "Müller the Painter," German artist and poet: b. Kreuznach, 13 Jan. 1749; d. Rome, 23 April 1825. Some of his etchings, animals, compositions in the Flemish style, pastoral scenes, etc., were remarkable for their originality and freedom. He deserves more credit as a poet, for at a time when German poetry had degenerated, Müller helped to give a new impulse to German literature. His best works, *'Nible'*, *'Faust'* and *'Genevieve'*, are characterized by richness, warmth and elevated delineation of character, though sometimes wild and disconnected.

MÜLLER, Friedrich Max (known as Max Müller), English philologist: b. Dessau, Germany, 6 Dec. 1823; d. Oxford, 28 Oct. 1900. His father was Wilhelm Müller (q.v.), a famous German lyricist, and his maternal great-grandfather Basedow, the educational reformer. His bringing up was in his mother's hands, as his father died when the boy was four. He studied in Leipzig, at the Nicolaischule; had some thoughts of becoming a musician, but entered the University of Leipzig in 1841, and there, under the leadership of Hermann Brochhaus, devoted himself to Sanskrit, publishing a German version of the *'Hitopadesa'* in 1844, worked under Bopp in philology and Schelling in philosophy at Berlin for a year; in 1845 went to Paris, where Burnouf suggested to him an edition of the *'Rig Veda'*; and in 1846 went to England and interested the East India Company in this work, which he undertook at the expense of the company. He was in Paris in 1848, and brought to Palmerston, in London, the first news of Louis Philippe's flight from Paris. In the same year he settled in Oxford, where the *'Rig Veda'* appeared, with Sâyana's commentary, 1849-74. He became deputy Taylorian professor in 1850, and Fellow of All Souls' in 1858; but in 1860 was defeated in his candidacy for the chair of Sanskrit by Monier Williams, after a fierce fight on the part of his opponents, who objected partly to his foreign birth and partly to his very free and unorthodox religious views. The result for linguistic science was unfortunate, as it turned Max Müller from the narrow field of Sanskrit, in which he easily outranked his contemporaries, to comparative philology and the science of religion, in which his achievements were less exact and scholarly, to say the least. In 1868 he became professor of comparative philology at Oxford. He was made a privy councillor in 1896. His greatest single work was as editor of the *'Sacred Books of the East'*, a series of English versions of Oriental scriptures, to which he contributed three volumes, and which was begun in 1879 and is not yet complete. He is possibly even better known as a popularizer of the first principles of linguistic science, so that he became in the lay mind the main exponent of this science, whereas his grasp of its detail was inadequate, and many of the etymologies he advanced showed that he was not conversant with the strict rules of phonetics. But the charm of his style, his general grasp of so large a subject, and his admitted pre-eminence in Sar-

skrit, make interesting and valuable, if not absolutely authoritative, reading of *The Science of Language* (1861-63); *Essays on Language and Literature*, and *Biographies of Words* (1888), all of which have passed through new editions. Max Müller's works on mythology and religion also have a higher repute among general readers than with the specialist, but it cannot be denied that they did much good in stimulating research, as the *Sacred Books* did in supplying a field for such research. In this class of writings mention should be made of the *Essay on Comparative Mythology* (1856); 'Introduction to the Science of Religion' (1873); 'The Origin and Growth of Religion' (1878); 'Natural Religion' (1889); 'Physical Religion' (1891); 'Anthropological Religion' (1892); 'Theosophy, or Psychological Religion' (1893); the 'Essays on Mythology and Folklore' in the 4th volume of 'Chips from a German Workshop'; and 'Contributions to the Science of Mythology' (1897). His versions from the Sanskrit and the Pāli have been alluded to; 'A History of Ancient Sanskrit Literature' (1859), and a 'Sanskrit Grammar' also should be mentioned, and it should be borne in mind that it is in this field that the scholar spoke with authority. From his youth Max Müller was interested in philosophy; he wrote an excellent version of Kant's 'Critique of Pure Reason' (1881); also 'The Science of Thought' (1887), urging that thought was inconceivable without language, and the Oriental studies, 'Three Lectures on the Vedānta Philosophy' (1894), and 'The Six Systems of Indian Philosophy' (1899). An entirely different side of the man is disclosed by 'My Indian Friends' (1899), which shows much of his broad and charming personality; or by 'Deutsche Liebe' (1857), a romantic and popular story translated into French, Italian and Russian, and appearing in English in two versions, one American, unauthorized and very successful, and a later one (1873) by Mrs. Max Müller. He also edited his father's poems (1868), and Scherer's 'History of German Literature.' His collected works, including the four volumes of 'Chips from a German Workshop' (1867-75), appeared 1898 et seq. Consult his own 'Auld Lang Syne' (1898), and 'My Autobiography' (1901); his wife's 'Life and Letters of Max Müller' (1902); and Whitney, W. D., 'Max Müller and the Science of Language' (New York 1892).

MÜLLER, Georg Friedrich, German-English philanthropist: b. Kroppenstädt, Prussia, 27 Sept. 1805; d. Bristol, England, 10 March 1898. Entering the University of Halle as a student of theology in 1825, although he had fallen into irregularities of life, he was converted before the end of that year, and in the following year began to preach and teach. In 1829 he went to London, whither the Society for Promoting Christianity Among the Jews had invited him, settled at Teignmouth as pastor of Ebenezer Chapel, where he gave up pew-rents and substituted box-collections, finally refusing a salary and depending on voluntary gifts. In 1832 he joined Henry Craik, a prominent member of the sect of Plymouth Brethren, in ministerial work at Bristol. In 1835 he published a proposal for the establishment of an orphan home, which took shape in 1836 at Bristol. The ex-

periment was successful, the work grew from year to year, and by 1875 no less than 2,000 children were lodged, fed and educated without other financial maintenance than that received in donations from all parts of the world. The orphanage was moved in 1849 to Ashley Down, a suburb of Bristol. With his wife Müller made evangelistic tours in Europe, America and Asia. He published *A Narrative of Some of the Lord's Dealings with Georg Müller* (1837). Consult biographies by Pierson (New York 1899); by Warne (New York 1911).

MULLER, Johann Friedrich Theodor, yō hān frēd'rih tā'ō-dōr (better known as FRITZ MÜLLER, and also known as MÜLLER-DESTERRO), German naturalist: b. near Erfurt, 31 March 1821; d. 1897. After studying at the universities of Greifswald and Berlin, he went to South America in 1848, and settled on the island of Santa Catharina, Brazil, living there the ordinary pioneer's life until appointed (1856) to teach natural history and mathematics in the Desterro gymnasium. From 1874 he was engaged for a time as collector for the museum at Rio de Janeiro. His published papers on crustaceans, insects, worms, jelly-fishes, etc., were many, most of them appearing in the 'Annals' of the Rio de Janeiro Museum, Wiegmann's 'Archiv für Naturgeschichte,' and similar publications. In his 'Facts for Darwin' (1864), a book written under the stimulus of Darwin's 'Origin of Species,' he made valuable applications of Darwinianism in new fields, and won reputation among men of science for the originality and fertility of his observations and deductions. Among the more important pieces of work which he did were researches on mimicry (q.v.) and the first clear statement of the theory of recapitulation (q.v.).

MÜLLER, Johann Gotthard von, German engraver: b. Beinhausen, near Stuttgart, 4 May 1747; d. Stuttgart, 14 March 1830. After studying under Guibal, the painter, he turned to engraving, and in 1770 went to Paris, where, under Willic, he studied for six years, and after winning several prizes was elected to membership in the French Academy. Returning in 1776 to Stuttgart, he taught there for nine years. While there he was called to Paris to engrave a portrait of Louis XVI. This is regarded as his most important work, next to which may be ranked his 'Battle of Bunker Hill,' after Trumbull; 'Madonna della Seggiola,' after Raphael, etc. He was knighted in 1818.

MÜLLER, Johannes, German physiologist: b. Coblenz, Prussia, 14 July 1801; d. Berlin, 28 April 1858. He studied, from 1819, at Bonn and Berlin, started service (1824) as private dozent of physiology and comparative anatomy at Bonn, and became assistant professor (1830), then (1833) professor of anatomy and physiology at Berlin. His first important works, 'Zur vergleichenden Physiologie des Gesichtsinns' (Leipzig 1826) and 'Über die phantastischen Gesichterscheinungen' (Coblenz 1826), are of a subjective philosophical tendency, the first concerning the most important facts as to human and animal sight; the second sounds depths of difficult psychological problems. He soon became the leader in the science of the morphological treatment of zoology as well as

of experimental physiology. To his active researches (1830) are due the foundation of the Bell law concerning the work of the roots of the nerves of the spinal marrow, the settlement of the theory of reflex action, the more exact knowledge of the blood's constitution, lymph, chyle, etc. He even investigated the vocal organs and sound expression, producing fundamental work on the sense of hearing. He finished his great work 'Handbuch der Physiologie des Menschen' (Coblenz 1833-40; 4th ed., 1841-44) in Berlin. It has been translated into English under the title 'Elements of Physiology' (1837-43). The work discloses an entire knowledge of physiology, including comparative organology and medical histology from their microscopical and chemical viewpoints. The work was epoch-making. From 1833 he issued numerous treatises on comparative and pathological anatomy and systematic zoology. Of such should be cited 'Der vergleichende Anatomie der Myxinoiden' (Berlin 1835-41); 'Beschreibung der Plagiostomen' (ib. 1838-41), in collaboration with Jacob Henle; 'Ueber den Bau und die Grenzen der Ganoiden und das natürliche System der Fische' (ib. 1844); 'Ueber die Larven und die Metamorphose der Echinodermen' (ib. 1849). His 'Ueber den feineren Bau der krankhaften Geschwülste' (ib. 1838), which was never finished, was a pioneer for microscopical research in pathological anatomy. From then on he worked almost exclusively in the realm of comparative anatomy and brought forth numerous researches concerning the lower animals. He took 19 trips to the Baltic and North Sea, the Adriatic and the Mediterranean to investigate salt-water life. It is declared of him that he was the most versatile, fruitful, genial and lucky investigator of modern days, and he maintained his vitality till the end. He never questioned the rights of philosophy or even faith nor positive religion, but no single being has done more toward placing physics and chemistry in their correct place in physiology and establishing the true method in contrast with the errors of natural philosophy, spiritualism and orthodoxy, for all time. From 1834 he published *Archiv für Anatomie, Physiologie und wissenschaftliche Medizin*. In 1899 a bronze statue was erected in his memory at Coblenz. Consult his biographies by Virchow (Berlin 1858) and De Bois-Reymond (ib. 1860).

MULLER, Johannes von, German-Swiss historian: b. Schaffhausen, 3 Jan. 1752; d. Cassel, 29 May 1809. He studied at Göttingen, and in 1772 became professor of Greek at the gymnasium at Schaffhausen, and published 'Bellum Cimbricum,' his first work. He lived and taught in Geneva 1774-80, where he began his 'Allgemeine Geschichte' (3 vols., 1810), and published the first volume of his 'Geschichte der Schweizer.' From 1781 to 1786 he taught history and statistics at the Collegium Carolinum at Cassel. In 1786 he became librarian and councillor of state to the Elector of Mainz. Here he wrote his 'Geschichte der schweizerischen Eidgenossenschaft' and several other works. In 1792, when Mainz was taken by the French, he went to Vienna, where the Emperor Leopold nominated him a member of the Privy Council. In 1804 he left Vienna for

Berlin, where he was appointed historiographer of the Hohenzollern family. He also published 'Ueber die Geschichte Friedrich I'; 'Ueber den Untergang der Freiheit der Alten Völker'; 'Versuch über die Zeitrechnungen der Vorwelt.' After the battle of Jena, he was appointed by Napoleon (1807) Secretary of State in the new kingdom of Westphalia. His 'Sämmtliche Werke' appeared in 27 volumes (1800-17); (new ed., 40 vols., 1831-35). Consult lives by Heeren (1820); Döring (1835); Monnard, in French (1839), and Thiersch (1881).

MULLER, Julius, German theologian: b. Brieg, Prussia, 10 April 1801; d. Halle, Germany, 27 Sept. 1878. He was educated at Breslau and Göttingen, and abandoned the study of law for theology. He was opposed to the Rationalists, and in 1825-31 was in charge of several small parishes. In 1831 he was preacher at Göttingen University, and in 1834 was elected professor of theology there. From 1835-39 he was professor in Marburg, and for the remainder of his life filled the chair of theology at Halle. His greatest work is 'Die christliche Lehre von der Sünde' (1829; trans. Edinburgh 1868), and among his other books are 'The Evangelical Union' (1854); 'Dogmatische Abhandlungen' (1870), etc.

MULLER, Karl Otfried, German archaeologist and philologist: b. Brieg, Silesia, 1797; d. Athens, 1 Aug. 1840. The son of a field preacher, his education began at the gymnasium of his native town. He was then sent to Breslau, and afterward went to Berlin, where, as a pupil of Böckh, he devoted himself to the study of the life and art of the ancients. After publishing the 'Ægineticorum Liber' (1817) he was appointed instructor in the Magdalum at Breslau. Here he made an elaborate analysis of Greek mythology, separating allegorical inventions from true history. In 1819 he was made professor of philology and in 1823 became professor ordinarius at Göttingen. He was a great traveler, and his writings embrace the whole circle of antiquity. His intention was undoubtedly to concentrate the results of his whole life of scholarly activity in his great work, 'Geschichte hellenischer Stämme und Städte.' He only completed two volumes, however: Vol. I, 'Orchomenos und die Myner' (1820), and Vol. II, 'Die Dorier' (1824). One of his best-known works, 'A History of the Literature of Ancient Greece,' a translation by Lewis and Donaldson from the author's manuscript, was published in London in 1840, and the continuator, Donaldson, published another edition in 1858. His 'Kunstarchäologische Werke,' in five volumes (1872-73), is a valuable work. Müller's 'Æschylus's Eumenides' (Göttingen 1833) was the object of a profound controversy in which Gottfried Hermann and his followers attacked him with great bitterness. Karl Müller was also prominent as an editor. Consult the biography by F. Ranke (1870).

MULLER, Morten. See MORTEN-MULLER.

MULLER, Victor, German historical painter: b. Frankfort, 29 March 1829; d. Munich, 21 Dec. 1871. Beginning his artistic career at the Frankfort art school, he continued it at Antwerp and ultimately went to Paris (1849), where he stayed for 11 years. dili-

ently studying the methods and manner of Couture, Delacroix and Courbet. He settled in Munich in 1865, and for the castle of Kronberg the Taunus painted a series of scenes from the history of Baron Hartmuth von Kronberg. He also produced his famous 'Hero and Alexander.' Following these works came 'Hamlet with Horatio in the Churchyard'; 'Ophelia'; 'Romeo and Juliet,' and his last and unfinished work, 'Faust on a Stroll.' Among his other works are 'Wood Nymph'; 'Tannhäuser in Venusberg'; 'A Scene from Les Misérables.' His last finished picture was a 'Flower Girl.' All of his works are distinguished by a certain literary or poetic character which appeals to the fancy like a strain of lyric music, although the coloring sometimes runs in its vividness to the verge of extravagance.

MÜLLER, Wilhelm, German poet: b. Dessau, 7 Oct. 1794; d. there, 30 Sept. 1827. He studied at Berlin, but the war of 1813 called him from his books, and he was present as a volunteer in the Prussian army at the battles of Lutzen, Bautzen, Hanau and Kulm. In 1814 he returned to his studies at Berlin. His journey to Italy (1819) produced his ingenious work 'Rom, Römer und Römerinnen' (1820), and on his return to Germany he became teacher of Latin and Greek in the newly-established school at Dessau, where he was also appointed ducal librarian. In 1824 appeared his 'Gedichte aus den hinterlassenen Papieren eines reisenden Waldhornisten.' His 'Lieder der Griechen' (1821-24) celebrate the awakening of an oppressed nation, its struggle and its victory. His 'Lyrische Spaziergänge' (Leipzig 1827) displays the same truth to nature, freshness and fire and the same harmony of language which characterizes his other poems. Many of his poems imitate with utmost perfection the true German Volkslied. Several of the 'Müllerlieder' are familiar through Franz Schubert's remarkable musical settings. His 'Bibliothek deutscher Dichter des 17. Jahrhunderts' (1822-27) is a valuable collection of the best lyric poems of that period. His works were collected in five volumes (1830). He was the father of Prof. Max Müller, the well-known philologist. A critical edition of his works appeared at Berlin in 1906. Consult Hako, B., 'W. Müller, Leben und Dichten' (Berlin 1908).

MULLER, Wilhelm Max, American Orientalist: b. Gleissemberg, Germany, 15 May 1862; d. 12 July 1919. He studied at the universities of Erlangen, Leipzig, Berlin and Munich, obtaining the degree Ph.D. at Leipzig. In 1888 he became a resident of the United States, but spent much time making researches in Egypt (1904, 1906 and 1910) under the auspices of the Carnegie Institution. He was professor in the Reformed Episcopal Seminary at Philadelphia after 1890 and assistant professor of Egyptology at the University of Pennsylvania. He wrote 'Asia and Europe after the Egyptian Monuments' (1893); 'The Love Poetry of the Ancient Egyptians' (1899), both of which are in German; 'Egyptological Researches' (1906-10); 'Mythology of the Ancient Egyptians' (in 'Mythology of all Races,' 1918). He was also a contributor to the 'Encyclopædia Biblica,' 'Jewish Encyclopædia' and joint

editor of 'Gesenius Hebrew Dictionary' (1905).

MULLER, mül'ler, William James, English painter: b. Bristol, 28 June 1812; d. there, 8 Sept. 1845. He studied painting under J. B. Pyne, and first exhibited in the Royal Academy in 1833, his picture being entitled 'The Destruction of Old London Bridge—Morning.' In 1833-34 he visited Germany, Switzerland and Italy, and in 1838 Greece and Egypt; while in 1843 he accompanied the Lycian expedition under Sir Charles Fellows, bringing back many sketches and pictures of Oriental life and scenery. He lived for some time in London, but returned to Bristol in later life. His pictures, though not numerous, are of exceptional power and merit, among the more notable being the 'Baggage Wagon'; 'Dredging on the Medway'; 'The Slave Market'; and the 'Salmon-weir.' He painted both in water-color and in oils, and was remarkable as a colorist. Consult the 'Memoir' by Solly (London 1875).

MULLER-URY, Adolfo, Swiss-American portrait painter: b. Airole, Switzerland, 28 March 1864. He was educated at the public schools and at Sarnen and became a pupil of Deschwanden at Stans, Switzerland, after which he entered the Munich Academy and then went to Paris to study under (1881-83) Cabanel. From 1883-85 he worked at Rome and came to the United States in 1886. He has done numerous canvases on religious subjects but his paintings are mostly portraits, among which figure Popes Pius X and XI, several cardinals including Mercier, Bishop Kennedy, English nobility and other celebrities. In America he has painted among other portraits those of President McKinley, General Grant, Senator and Mrs. Depew, Senator Hanna, J. Pierpont Morgan, J. J. Hill, Mrs. Woodrow Wilson (1916). President Wilson (1917), etc.

MULLET, the name of several distinct kinds of fishes having external similarities. (1) The red mullets or surmullets are a group of elongate marine fishes of moderate size, renowned for the delicacy of their flesh, and the esteem in which they were held by the ancients. They with the goat fishes (*Upeneus*) and others form a family *Mullidae*, with five genera and about 40 species, found in all tropical seas, and some species straying northward. Jordan, who classifies them in the suborder *Berycoidei*, remarks: "The family is a very natural one and not closely related to any other." It resembles the barracudas (*Polymixiidae*) in having two long unbranched erectile barbels at the throat, which are of service in exploring the muddy bottom along which these fishes creep and search for animal food, mainly small crustaceans. The best-known species is that of the Mediterranean (*Mullus barbatus*), which is a small fish, rarely exceeding six inches in length, and is carmine red on the upper parts and silvery white on the lower surface. This is the fish held in so high esteem by Roman epicures, and reared in ponds where they were attended and caressed by their owners, and taught to come to be fed at the sound of the voice or bell of the keeper. Specimens were sometimes sold for their weight in silver. Pliny instances a case in which the sum of about £60 sterling was

paid for a single fish; and an extraordinary expenditure of time was lavished and wasted upon these slow-learning pets. Juvenal and other satirists descanted upon the height to which the pursuit of this luxury was carried as a type of foolish extravagance. Hortensius, the rival of Cicero, we are told, had a canal of water constructed below the festive table, in which the mullets were allowed to swim, and from which they might be carried to table, and thence to the fire to be cooked and dressed. Apicius invented a mode of drowning or suffocating these fishes in a certain sauce or pickle, which process was said to add highly to their flavor. A similar fashion prevailed of old in England with regard to lampreys, which were drowned in wine previously to being cooked and eaten. This mullet is still esteemed as an article of food, the flesh being white, fat and nutritious. They are caught mainly in nets and are hawked about the streets of Italian cities, not under the old Latin name *mugli*, but by one from the Greek, *trigle*. The roes are preserved as condiment called *botargo* and resembling caviar.

A closely related fish, the striped red mullet or surmullet (*M. cephalus*), is caught abundantly about the British Islands and along the Continental coast, and is seen sparingly in the local markets. By some naturalists these mullets are thought to be only the females of the Mediterranean species. A smaller form of the same species is frequently taken on the eastern coast of the United States. Another genus (*Mullolides*) is represented in the Gulf of California by a single species.

(2) The gray mullets are a group of spiny-rayed marine fishes forming a family (*Mugilidae*) of the suborder *Percesoces*, allied to the silversides and barracudas. They are oblong fishes of moderate size, without a lateral line, very numerous in species common in all warm parts of the world, and often appearing in vast schools, so that they may be captured by wholesale in large nets. Though the flesh is not so good as that of the red mullets it is nutritious, and many species are economically important. These mullets are short-finned, small-mouthed, bottom-feeding fishes, subsisting chiefly upon the little animals or organic matter found in sand and mud; and they have a special straining apparatus in the pharynx for the purpose of preventing objects of too large size from entering the stomach, or foreign substances getting into the gill-chamber; after grinding a mouthful between the pharyngeal bones (for teeth are absent or feeble) the mineral matter is rejected. Another peculiarity of the mullets is to be found in the structure of the oesophagus and stomach, the former being lined with long threadlike papillae, while the latter has its second portion furnished with muscular walls like the gizzard of a bird, but not divided. The common species is the striped or liza (*Mugil cephalus*) which seems to be almost cosmopolitan, as it is known not only on both Atlantic shores but abundantly from California to Chile. It is one to two feet long, dark bluish above, sides silvery, with conspicuous dark stripes along each row of scales. A smaller, more thoroughly marine species, dark olive and without streaks, is the white mullet or liza blanca (*M. curema*) numerous on both American coasts. Several other species are taken in the Gulf of Mexico and southward, one of which (*M. gyrans*) has

the curious habit of swimming round and round at the surface in schools, and is called whirling mullet.

(3) In the Mississippi Valley, several suckers (q.v.) of the family *Catostomidae* are called mullets in reference to their mulletlike appearance and behavior.

Consult Günther, *Study of Fishes* (1880); Goode, *Fishery Industries*, sec. 1 (1883); *American Fishes* (1888); Jordan and Evermann, *American Food and Game Fishes* (1902); La Gorce, John Oliver, ed., *The Book of Fishes* (National Geographic Society, Washington, D.C., 1939).

MULLIGAN LETTERS, in American political history, a series of letters written by James G. Blaine (q.v.) to Warren Fisher, a business associate, which it was alleged proved legislative corruption upon the part of Blaine in the matter of bills in Congress concerning the Little Rock and Fort Smith, and the Northern Pacific railroads. The letters were obtained by one James Mulligan, a clerk of Fisher, who appeared as a witness before a Congressional committee appointed to investigate Blaine. On 5 June 1876 Blaine secured these letters and read them before the House, after defying the committee to compel him to surrender them. The letters were freely used as campaign documents in the presidential contests of 1876 and of 1884, by Blaine's enemies. Consult Peck *Twenty Years of the Republic* (New York 1906).

MULLINGER, mül'ling-gér, James Bass, English historian: b. Bishop Stortford, England, 1834; deceased. He was graduated from Saint John's College, Cambridge, in 1866 and in 1881-83 was lecturer at Bedford College, London. In 1885-95 he was lecturer on history of education to the Teachers' Training Syndicate at Cambridge and in 1890-94 lecturer on ecclesiastical history at Trinity College, Cambridge, after which he became librarian and lecturer in history in Saint John's College. He published among other works, *Cambridge Characteristics in the 17th Century* (1867); *The Schools of Charles the Great* (1876); *The Age of Milton* (1897); *History of Saint John's College, Cambridge* (1901). He was also the author of encyclopedia articles on various subjects.

MULLION, in architecture, a vertical division between the lights of windows, screens, etc. The term is also applied to the division between the panels in wainscoting.

MULOCK, mū'lök, Dinah Maria. See CRAIK, DINAH MARIA.

MULOCK, mū'lök, Sir William, Canadian educator and politician: b. Bond Head, Ontario 19 Jan. 1844; d. Toronto, 1 Oct. 1944. He was graduated from the University of Toronto in 1863 and in 1868 was admitted to the bar. He was elected to the Parliament of Canada in 1882 and was vice-chancellor of the University of Toronto from 1881 until 1900. He was Postmaster-General of Canada from 1896 to 1905 and was instrumental in establishing penny postage within the empire. He was Minister of Labor 1900-05, Chief Justice, Exchequer Division of the Supreme Court of Ontario (1905-23), and then Chancellor of the University of Toronto.

MULREADY, mŭl-rĕd'ĭ, **William**, Irish genre painter: b. Ennis, County Clare, Ireland, April 1, 1786; d. London, England, July 7, 1863. He was born to working-class parents and brought up in London, where with the assistance of the sculptor Thomas Banks, he entered the Royal Academy as a pupil in 1800. He first exhibited at the academy in 1804, and became a member in 1816. Mulready's work was influenced by Dutch painters of domestic scenes and by his contemporary Sir David Wilkie (q.v.). He chose scenes from common life, and his canvases had a high moralistic and anecdotal quotient, as indicated by some of their titles: *Lend me a Bite*, *Choosing the Wedding Gown*, and *The Wolf and the Lamb*, which was purchased by the royal family. He also illustrated Oliver Goldsmith's *Vicar of Wakefield* and in 1840 made the design for the first British postal envelope. Most of Mulready's best work became the property of the nation after he died.

MULTAN, mŭl-tān', or **MOOLTAN**, city, Pakistan, capital of Multan District, in southern Punjab. The District of Multan, with an area of 5,653 square miles, grows grain, cotton, sugar, fruit, indigo, and silk. The city manufactures textiles and a variety of metal products; handicrafts like pottery, leather, ivory, and silver work are also important. Multan is a banking and export center for the area west of the Indus. So ancient that Herodotus mentions it, the city was fought over by many nations and finally conquered by the British from the Sikhs in 1849. It has ruined Moslem shrines, elaborate fortifications, and a Hindu temple to Vishnu. Pop. (1951) district, 2,107,603; city, 190,122.

MULTIGRAPHING MACHINES. See BUSINESS MACHINES AND EQUIPMENT.

MULTIPLE SCLEROSIS, sklĕ-rō'sis, is a widely distributed disease of unknown origin in which myelin, a fatty complex, which envelops certain areas in the central nervous system, is altered and replaced by scars or sclerotic plaques. It usually affects the 20 to 40 age group and patients have disturbed vision, gait, speech, balance and loss of bladder and bowel control.

A large number of theories have been advocated as to its cause but none is accepted by authorities. Any part of the brain or spinal cord may be involved but the white matter in the cerebellum, cerebrum, and spinal cord is most commonly damaged. The great variety of clinical signs is considered to be a consequence of the scattering of sclerotic plaques irregularly throughout the nervous system.

The course of the disease is uncertain and it may progress rapidly, remain unchanged for years, or show remissions. It was once thought that the average duration of the disease was about one decade but a recent study showed that 17 years after the onset of the disease 42 per cent of its victims were walking and working.

While there is no specific therapy for this disease it is the consensus that patients should be observed very closely by their family physician in order to avoid intercurrent infection and other conditions which by decreasing general resistance may make patients less able to resist the multiple sclerosis process. Psychological and rehabilitative therapy are of the greatest value. Such a therapeutic program is described as "management" of

multiple sclerosis by the National Multiple Sclerosis Society, New York, N. Y.

MULTIPLE SERIES. See SERIES.

MULTIPLICATION. See ARITHMETIC.

MULTITUBERCULATA, mŭl-tĭ-tŭ-bŭr-kŭ-lă'tă, a group of fossil mammals of small size, which lived from Mesozoic to Paleocene times. See ALLOThERIA.

MUMFORD, mŭm'fĕrd, **Lawrence Quincey**, librarian of Congress: b. Ayden, N. C., Dec. 11, 1903. He was educated at Duke and Columbia universities, and from 1929 to 1945 was associated with the New York Public Library. In the latter year he became assistant director of The Cleveland Public Library, and five years later its director. In 1954 he was named librarian of Congress, the first professionally trained librarian to hold the position.

MUMFORD, Lewis, American author and sociologist: b. Flushing, N. Y., Oct. 19, 1895. He was educated in New York City schools and colleges, and began his literary career as an editor on the *Dial* (1919). Among his earlier books were *The Story of Utopias* (1922) and *Herman Melville* (1929). Later he taught at Dartmouth College, Stanford, and North Carolina universities; was a member of the New York City Board of Higher Education (1935-1937); and, from 1951, professor of regional planning at the University of Pennsylvania. His chief work is as a social critic, especially of city living and machine-age culture. These themes are explored in his trilogy—*Technics and Civilization* (1934), *The Culture of Cities* (1938), *The Condition of Man* (1944)—and in a later work, *Art and Technics* (1952).

MUMMERS, mŭm'ĕrz, bands of costumed men and women who in ancient and medieval Europe led festal rites, especially at the Saturnalia and Christmas. Hence it has also become a facetious term for actors. Sir James George Frazer associates the Whitsuntide mummers with ceremonies in which the vernal god was killed in primitive cults.

MUMMICHOG. See KILLIFISH.

MUMMIUS, mŭm'i-ŭs, **Lucius** (surnamed ACHAICUS), Roman general and statesman: fl. 2d century B.C. While consul in 146 B.C., he brought to completion the Roman conquest of Greece, destroying the city of Corinth and removing its art treasures to Rome. He was censor in 142 B.C. with Scipio the Younger.

MUMMY, mŭm'i (Arab. *mumiya*, bitumen; Pers. *mum*, wax), a dead body preserved by embalming. The wider use includes bodies preserved dry by any process but it was among the ancient Egyptians that the art and practice of embalming the dead was carried to the greatest extent and highest perfection. From Egypt the practice spread southward along both coasts of Africa and to India, Malaysia, Polynesia, Australia, and Arabia. On the Western con-

tinient it reached Peru, Colombia and Mexico and also Alaska. In the last-named country it may have been sporadic for it was first in vogue there about 1720. All the dead of Egypt, including many animals, were embalmed in some manner, partly, it is supposed, from religious motives and partly for sanitary reasons. The notion formerly prevalent that the Egyptians preserved the body in order to keep it in a fit state to receive the soul when it should have passed through its allotted transmigrations is inconsistent with the facts that tombs were sometimes sold to later occupants. The origin of embalming among the Egyptians has been attributed to their first merely burying in the sand, impregnated with natron and other salts, which dried and preserved the body, which natural process they afterward imitated, drugs and bitumen being later improvements. Comparatively few mummies of children have been discovered in Egypt, though even those just born were embalmed. Embalming was practised by the Hebrews to some extent. Joseph commanded the physicians to embalm his father and in the time of Christ it was "the manner of the Jews" to bury the body "wound in linen cloths with spices." The practice continued in Egypt from 4500 B.C. till the 7th century, and was common among the Greeks there, and even among the early Christians. It seems to have fallen gradually into disuse. See also **EMBALMING**; **EGYPT**. Consult Meany, E. S., 'Alaskan Mummies' (Seattle 1906); Pettigrew, J. J., 'A History of Egyptian Mummies' (London 1834); Smith, G. E., 'The Migration of Early Culture' (Manchester, England, 1915).

MUMMY WHEAT, a variety of wheat said to have been produced from grains found in an Egyptian mummy, but there is no good reason to believe the legend. It has long been in general cultivation in Egypt and neighboring countries in Africa. The spike is compound

MUMPS, a popular name for a contagious epidemic inflammation and enlargement of one or both parotid salivary glands, occurring usually in youth, males being more frequently affected than females. In some localities it disappears for years, in other places it is endemic. Epidemics usually occur in the spring or fall. One attack generally gives immunity. The period of incubation is from 7 to 20 days. The disease is sometimes preceded for a few days by malaise, loss of appetite, irritability and feverishness. Its onset is marked by stiffness and pain about the jaws, followed by heat, pain and swelling about the lobe of the ear, earache and tinnitus aurium, fever (100°–104° F.), more or less rigidity of the neck, with distortion of the side of the head and difficulty in chewing, swallowing and talking. The inflammation is usually at its height by the third day of the disease, and the disease has subsided generally by the 7th or 10th day. Very seldom is there any suppuration of the affected gland. In some cases the subsidence of the gland inflammation is followed by pain and swelling of the testes of the male, and of the ovaries, vulva and breasts of the female, the complication being more common in males than in females. Occasionally a meningitis supervenes. Not infrequently a middle ear catarrh follows, leading to total deafness. The term **mumps** is sometimes applied to a parotiditis

following a local injury, diseases of the mouth, diphtheria, occlusion of the salivary duct by a foreign body, etc. There is a secondary symptomatic or metastatic form of mumps which sometimes follows dysentery, scarlet fever, small-pox, measles, etc. The parotid gland in this form of mumps tends to suppurate. The best treatment for mumps consists in rest, preferably in bed, the giving of saline laxatives and soft food, relieving the fever, and securing sleep by mild remedies and keeping the face warm with flannel or some other agreeable application. In cases of slow convalescence tonics should be given.

MUN, mèn, Albert, **COUNT DE**, French politician: b. Lumigny, Seine et Marne, 23 Feb. 1841; d. 1914. He was graduated (1862) at Saint Cyr, and entered the army and fought in the Franco-Prussian War (1870–71), to become a captain and ordnance officer of the governor of Paris. He devoted himself to the Ultramontaine party and founded the Catholic Labor Circles. Owing to the complaints of the Liberals concerning such activities on the part of an officer he resigned (1875) his commission and, with the aid of the Clerical party, was elected (1876) as deputy. He took his place among the extreme "Rights," representing both Church and monarchy. He led mass-meetings to agitate for the union of Church and State and social reform in the Catholic sense. In 1897 he was made member of the Academy. In 1913 he advocated the abolition of the Three-Year Military Law, but when war broke out next year his eloquent oratory was exerted exhorting his fellow-citizens to show courage and persistence. His speeches were issued in collective form (Paris 1888–1904) in seven volumes. He wrote 'Les congrégations religieuses devant la Chambre' (1903); 'Contre la séparation' (1905); 'L'heure décisive' (1913).

MUN, Thomas, English merchant and political economist: b. London, England, June 1571; d. there, July 1641. He engaged in mercantile business when very young, was interested in the Mediterranean trade and in 1615 was a director of the East India Company. As a writer on economics he presents really the first clear and systematic treatment on the subject and his is admitted to have been of great influence. He published 'A Discourse of Trade from England into the East Indies,' in 1621, and his greatest work, 'England's Treasure by Foreign Trade,' was published posthumously in 1664.

MUNBY, Arthur Joseph, English poet b. Bulmer, Yorkshire, England, 22 Aug. 1828; d. Ripley, Surrey, 29 Jan. 1910. He was graduated at Trinity College, Cambridge, in 1851, and was admitted to the bar of Lincoln's Inn in 1855. He was the author of 'Verses Old and New,' which contains the much admired pastoral poem 'Doris' (1865); 'Dorothy' (1880), which has been widely circulated in the poet's own country and in America; 'Vestigia Retrorsum' ('Steps Backward,' 1891); 'Vulgar Verses, by Jones Brown' (1891), mostly in dialect; 'Susan' (1893); 'Ann Morgan's Love' (1896); 'Poems, Chiefly Lyric and Elegiac' (1901); 'Relecta' (1909).

MUNCH, moonn, Peter Andreas, Scandinavian historian: b. Christiania, Norway.

Dec. 1810; d. Rome, 25 May 1863. He was educated at the University of Christiania and studied deeply the old Norse language and antiquities. In 1841 he was appointed professor of history at the University of Christiania. He was accorded the unusual privilege of access to the papal archives in Rome, where he spent much time in study. His principal work is 'History of the Norwegian People' (1852-63). Munch published several works of a linguistic character, and, repudiating the term 'Icelandic,' maintained that the so-called Icelandic literature was really Old Norse. He also translated several of the Old Norse sagas. A collection of his essays was edited by Gustav Storm (1873-76).

MUNCH, Peter Andreas, Norwegian poet: b. Christiania, 19 Oct. 1811; d. near Copenhagen, 27 June 1884. He was originally a student of law, but became an editor (1841-46) and professor in the university (1866) at Christiania. Among his writings are 'Sorg og Tröst' ('Grief and Consolation'), of which seven editions have been printed; 'Ephemera' (1836); 'King Sverre's Youth' (1837), a drama; 'The Singer' (1838); 'Poems Old and New' (1848); 'Pictures from North and South' (1848), in prose; 'New Poems' (1850); 'Lord William Russell' (3d ed., 1888), a tragedy, and 'An Evening at Giske' (1855), a historical drama. Munch translated into Norwegian many works from such authors as Tennyson and Walter Scott, and wrote some popular Norwegian songs.

MUNCH-BELLINGHAUSEN, münk-bēl'-ling-how'zēn, **Eligius Franz Joseph**, FREIHERR VON, also known under the pseudonym FRIEDRICH HALM, Austrian dramatist and short-story writer: b. Krakau (Cracow), 2 April 1806; d. Vienna, 22 May 1871. He came to Vienna in 1811 and began studying law there in 1822, making the acquaintance while a young student of such prominent literary men as Bauernfeld, Lenau, Seidl, etc. In 1826 he entered the employ of the Austrian government as a lower official and remained in the bureaucracy from that time until his death, his chief positions being custodian (later director) of the court library and general superintendent of the Vienna Hofburgtheatre. As a dramatist, Halm's position in German literature is that of a constructor of correct dramatic outlines, often banal in their conventionality, which are always surrounded with resounding rhetoric and a peculiar union of romanticism and pessimism, together with occasional real feeling. His first play, 'Griseldis' (1835) had a great stage success and passed over most of the stages of Germany. There followed a number of less successful productions: 'Camoens' (1837); 'Adept,' tragedy (1838); 'Imelda Lambertazzi,' tragedy (1842). His greatest success and his best-known play is 'Der Sohn der Wildnis' (1842; known on the English stage as 'Ingomar'), although 'Der Fechter von Ravenna' (1857) also was very popular. Of his short stories the best are 'Die Marzipanliese' and 'Das Haus an der Veronabrücke.' His works have been published: 'Werke' (8 vols., Vienna 1856-64; 4 additional vols., 1872); 'Ausgewählte Werke' (4 vols., Leipzig 1904; another ed. by Bong, Berlin 1910). Consult Schneider, 'Friedrich Halm und das spanische

Drama' (Berlin 1909); Schachinger, R., 'Briefwechsel zwischen M. Enk und Halm' (Wien 1890); Pachler, F., 'Die Jugendjahre Halms' (Wien 1877).

MUNCHEN (mün'hēn) **GLADBACH**. A town in the Prussian Rhine province.

MÜNCHHAUSEN, mün'h'how-zēn, **Hieronymus Karl Friedrich**, BARON: b. Bodenwerder, Hanover, 1720; d. there, 1797. He was a German soldier and served in his youth as a cavalry officer in the Russian army. He was possessed of an adventurous and dare-devil spirit and an imagination that knew no bounds. He told the most wonderful stories of his adventures in the Turkish campaign of 1737-39, and soon became famous as the most unique exaggerator that ever lived. The tradition of the baron's story-telling is supported by the evidence of a clergyman, who says that in his old days the officer used to relate his most surprising adventures "in a cavalier manner, with a military emphasis, but without any passion and with the easy humor of a man of the world, as things which required no explanation or proof." His tales are thought to have been first compiled by Rudolf Erich Raspe, a man of letters, who, being compelled to flee from his position as curator of the museum at Cassel to England on account of a charge of embezzlement, was engaged in London in literary pursuits, and is generally believed to have published anonymously an English edition of the stories under the title of 'Baron Münchhausen's Narrative of his Marvelous Travels and Campaigns in Russia' (1785). A second edition, enlarged and ornamented, was published at Oxford in 1786 under the title of 'The Singular Travels, Campaigns, Voyages and Sporting Adventures of Baron Munnikhouzen, commonly pronounced Munchausen; as he relates them over a bottle when surrounded by his friends.' A third edition, published by Kearsley in London the same year, bore the title of 'Gulliver Revived.' The story passed through many editions by different hands, gaining more and more accretions each time, whether in form of borrowings from Lucian or of topical 'hits' on Baron de Tolt, Montgolfier, the first balloonist, or Bruce, the explorer of the Nile. One of the best editions is that by Shore (1872), illustrated by Doré, with additions by Theodore Gautier. It is said a large proportion of the hunting tales are derived from Henry Bebel's 'Facetiæ' (1508), while other incidents are borrowed from Castiglione's 'Cortegiano' and Bidermann's 'Utopia,' which are included in Lange's 'Deliciæ Academicæ' (1765). Consult Müller-Fraureuth, 'Die deutschen Lügendichtungen auf Münchhausen' (1881). See ADVENTURES OF BARON MÜNCHHAUSEN, THE.

MUNCHHAUSEN: A Story in Arabesques: a satirical romance by Karl L. Immermann (q.v.) originally published in four volumes in Düsseldorf during 1838-39. The eponymous hero is presented as the nephew of the famous prevaricator, while the author has also taken at least a part of his ideas from 'Don Quixote' in attaching to the hero a droll serviteur who closely resembles the materialistic Sancho Panza. Other influences are traceable in the work, notably of Rückert's translation of Hariri's 'Makamen,' Swift's 'Gulliver's

Travels and Gil Blas. The story may be described as a formless mass of episodes played in Westphalian villages. The *New Münchhausen* is a traveller like Humboldt; like Gulliver, he sojourns among and converses with animals; like *Gil Blas* he serves as kitchen boy; like Cagliostro he lives indefinitely on rejuvenating medicine. He appears in different roles, and in each character successfully exploits the credulity of his audiences. As a disinterested financier and company promoter he is eminently and humorously successful.

MUNCIE, mŭn'sī, Ind., city and Delaware County seat, altitude 950 feet; on the White River, not navigable; on the Chesapeake and Ohio; the Cleveland, Cincinnati, Chicago and St. Louis; and the Indiana Railroad System, 57 miles northeast of Indianapolis. State and federal highways, an airport, and electric lines also furnish transportation facilities. The county is agricultural, with grains and hay as principal crops, although there are many dairy, fruit, and truck farms. Of the county's 250,880 acres, 237,000 are under cultivation. Among the industrial products of the city are automobile parts, boilers, glass, iron and steel wire and various wire products; metal furniture, silverware, and novelties; and various items of electrical equipment. Muncie's public school system links with the Ball State Teachers College in courses and in teaching personnel. The plant includes a building for vocational and physical education. The courthouse, city hall, post office, library, Masonic temple, and Ball Memorial Hospital are the most notable buildings. Cultural interests include a civic theater and the Ball State Art Gallery. Twelve social agencies unite in support of the Muncie Community Fund. First settled in 1827, incorporated as a town in 1847 and as a city in 1865, Muncie attained its present status as a city of the second class in 1921. Its name, fixed by act of the legislature in 1845, is derived from the name of an Indian tribe, the Munsees. The city has mayor and council, with city treasurer, auditor, clerk, and judge elected; other officers appointed. The water, light, and power systems are all privately owned and operated. Pop. (1930) 46,548; (1940) 49,720; (1950) 58,479.

MUNDE, mŭn'dē, Paul Fortunatus, American gynecologist: b. Dresden, Saxony, Sept. 7, 1846; d. New York, Feb. 7, 1902. After coming to the United States in 1849, he attended the Boston Latin School and then studied medicine at Yale. He left before completing his course, entering the Union Army as medical cadet in 1864. He was afterward graduated from the Harvard Medical School in 1866 and went to Germany, where he enlisted in the Bavarian Army. He was decorated by the emperor with the Iron Cross for heroism in saving the lives of patients from a burning hospital near Paris. After devoting himself to study and practice in hospitals in Berlin, Heidelberg, Paris, London and Edinburgh he took up his residence in New York in 1873, and practised obstetrics and gynecology. He was appointed professor at Dartmouth Medical College and in the New York Polyclinic in 1882. He edited (1874-1892) the *American Journal of Obstetrics*, and was president of the American Gynecological Society in 1897-1898. Among his works are *Minor Surgical Gynecology* (1880); *Appendix to the Mid-*

wifery of Caseaux and Tamier (1884); *Pregnancy and the Puerperal State* (1887); and *Diseases of Women* (1891).

MUNDELEIN, George William, American cardinal: b. New York, July 2, 1872; d. Mundelein, Ill., Oct. 2, 1939. He was educated at St. Nicholas School, De La Salle Institute Manhattan College, New York, N. Y., St. Vincent's Archabbey, Latrobe, Pa., Propaganda College, Rome. Ordained priest at Rome in June 1895, he returned to the United States and was named secretary to the bishop of Brooklyn and pastor of the Lithuanian Church at Williamsburg. In 1897 he was made chancellor of the diocese of Brooklyn; named domestic prelate with the title of right reverend in 1906; consecrated titular bishop of Loryma and auxiliary bishop of Brooklyn on Sept. 21, 1909. On Dec. 6, 1915, he was named archbishop of Chicago and on March 24, 1924, was elevated to the Sacred College of Cardinals, becoming "The First Cardinal of the West." He was host to the 28th International Eucharistic Congress in Chicago, June 1926, and papal legate to the 8th National Eucharistic Congress in New Orleans, La., in October 1938. In that same year he presided at the beatification ceremonies of Mother Francis Xavier Cabrini in Rome, and, in 1939, participated in the election of Pius XII.

During his administration of the archdiocese of Chicago for nearly 24 years, he emphasized the importance of the parochial school system in the development of Catholic and American citizenry, founded 91 parishes, and had some 600 buildings erected for religious purposes. Always the champion of human and civil rights, he vigorously assailed the anti-Catholic and racial propaganda of the Nazi government in the pre-war years. During and after World War I he showed himself a prelate, patriot, and world-citizen by his earnest support of Liberty bonds and his aid to the starving people of Europe. He died of a heart attack at St. Mary of the Lake Seminary, Mundelein, Illinois. This edifice, perhaps the outstanding memorial to the cardinal in tangible form, preserves the remains, which are buried beneath the high altar of the main chapel.

SAMUEL CARDINAL STRITCH,
Archbishop of Chicago.

MUNDT, mŭont, Klara Müller ("MÜHLBACH, LUISE"), German novelist: b. Neubrandenburg, January 1814; d. Berlin Sept. 26, 1873. She was married to Theodor Mundt (q.v.) in 1839. She was an extremely prolific writer of popular historical novels, which though quite without merit in point of style are by no means wanting in descriptive excellence. They were all published under the pen name "LUISE MÜHLBACH" and have had as many eager readers in this country and England as in the writer's own land. Among them are *Queen Hortense* (5th ed., 1861); *Emperor Joseph II and his Court* (9th ed., 1866); *Marie Antoinette and her Son* (1867); *Emperor Alexander and his Court* (1868); *Mohammed Ali and his House* (1871); *Frederick the Great and his Court* (8th ed., 1882).

MUNDT, Theodor, German author: b. Potsdam, Prussia, Sept. 19, 1808; d. Berlin, Nov. 30, 1861. He was the husband of Luise Mühlbach. He studied at the University of

Berlin, and in 1842 became privat docent there. In 1848 he was appointed professor of literature and history at Breslau, and in 1850 was recalled to Berlin as university librarian and professor. He belonged to the "Young German" school, was a Radical in politics and favored the emancipation of women. His writings include *Madonna, Unterhaltung mit einer Heiligen* (1840), a memoir of Charlotte Stieglitz; the novels, *Thomas Münzer, Carmela* (1844); *Mendoza, der Vater der Schelme* (1847); *Die Matadore* (1850); the critical and historical works, *Kunst der Deutschen Prosa* (1837); *Geschichte der Gesellschaft; Geschichte der Weltliteratur; Geschichte der Literatur der Gegenwart* (1852); and political sketches included in *Pariser Kaiserskizzen* (1856); *Paris und Louis Napoleon* (1858); *Italienische Zustände* (1859-60). He also published Luther's *Pölitische Schriften*, and with Varnhagen von Ense edited Knebel's letters and posthumous works.

MUNDY, a family of English musical composers: (1) William Mundy (d. about 1591) was a gentleman of the Chapel Royal (1564-1591) and author of the anthem *O Lord, the Maker of all things*. (2) His son John (d. 1630) was also gentleman of the Chapel Royal, an organist at Eton College and St. George's Chapel, Windsor. He wrote anthems, madrigals and songs. Consult Grove's *Dictionary of Music and Musicians*.

MUNGER, Robert Sylvester, American inventor and manufacturer: b. Rutersville, Fayette County, Texas, July 24, 1854; d. Birmingham, Ala., April 20, 1923. He was educated in the Rutersville public schools and the preparatory department of Trinity University, Tehuacana. After taking charge of his father's small plant for the manufacture of cotton gins he evinced considerable inventive talent in improving ginning machinery. His earliest inventions included three saw cleaners patented in 1878 and 1879 and a saw-sharpening tool patented in 1882. In 1885 he established a manufacturing plant at Dallas to exploit his patents and in 1888 organized the Munger Improved Cotton Machinery Company. Resigning the presidency a year later, he soon afterward moved to Birmingham, Ala., and organized the Northington-Munger-Pratt Company in 1892 for the manufacture of cotton gin machinery. The same year he patented what was perhaps his most important invention, a machine "for handling, cleaning and distributing seed cotton." The Munger system, as it was soon called, was a great improvement over the former system and became standard throughout the cotton states and in foreign countries. He also invented a duplex cotton press, a baling machine, and a cotton elevator, cleaner and feeder.

MUNGER, Theodore Thornton, American Congregational clergyman: b. Bainbridge, N. Y., March 5, 1830; d. New Haven, Conn., Jan. 11, 1910. He was graduated at Yale in 1851, and at Yale Theological School in 1855. He held pastorates at Dorchester, Mass., 1856-60; Haverhill, Mass., 1862-70; Lawrence, Mass., 1871-75; San José, Cal., 1875-76. He was for several years pastor at North Adams, Mass., resigning in 1885 to become pastor of the United

Church, New Haven, Conn. He was prominent in his denomination as well as an active supporter of municipal reform. He published *On the Threshold* (1880); *The Freedom of Faith* (1883); *Lamps and Paths* (1883); *The Appeal to Life* (1887); *Horace Bushnell* (1899); *Character Through Inspiration*. Consult Bacon, B. W., *Theodore Thornton Munger, New England Minister*. (New Haven 1913).

MUNGO, Saint, or **KENTIGERN**, the patron saint of Glasgow: b. Culross, about 518; d. Glasgow, Jan. 13, 603. He was baptized and brought up by Saint Serf, the head of a monastery at Culross. His name, Kentigern or Cyndegyrn (from *ken* and *tycarna*), means head lord, and it is said that it was exchanged by the brethren of the monastery for Mungo, the beloved, on account of the affection they bore him. On leaving Culross Kentigern took up his abode as a missionary priest near the site of the present Glasgow. Here he was chosen bishop, but having troubles with the king of the Strathclyde Britons afterward took refuge at Saint David's in Wales, and while in that region founded a religious establishment under a follower named Asaph, which afterward became the seat of the bishopric of Saint Asaph. Redderech, king of the Strathclyde Britons, recalled him to Glasgow, where he acquired a character of great sanctity. The city arms of Glasgow are associated with various legends concerning Saint Mungo, and the cathedral is supposed to be built on the site of his monastery. The parish of Saint Enoch, in Glasgow, is so called from a corruption of his mother's name (Theanu). A life, written by Jocelyn of Furness about 1180, was published in Pinkerton's *Vitae Antiquae Sanctorum Scotiae*.

MUNICH, mü'nik, or **MÜNCHEN**, mün'-chen, Germany, the capital of Bavaria, one of the most beautiful cities in Europe, lies on an extensive but uninteresting plateau, about 1,700 feet above sea-level, on the left bank of the Isar, with suburbs on the right, the river being crossed by nine bridges. The original nucleus of the town was at one time surrounded by walls and ditches, and entered by lofty turreted gates. The ditches have been filled up and the walls removed, but three of the old gates, with their loopholed and embattled flanking towers, still remain. In the older part of the town there are many old houses, irregular both in size and form, and of quaint but not picturesque architecture. This quarter, though it contains the government offices and many public edifices, is surpassed, both in extent and magnificence, by the new town, which has risen chiefly to the north and west, with almost unexampled rapidity and splendor, due to the art-loving proclivities of King Ludwig I and his successors, who spent over 7,000,000 thalers in beautifying the city, and adorning it with buildings of almost every style of architecture, wide and handsome streets, and squares and gardens decorated with statues and other monuments. Near the center of the city, between the Max-Joseph-Platz and the palace gardens, is the royal palace, consisting of an old central building of vast extent and two modern wings. From this great pile run at right angles to each other the two finest streets in Munich—the Maximilianstrasse and the Ludwigstrasse. The chief pub-

lic buildings are the old town-house and the new, the latter in the Gothic style, considerably enlarged in 1899; the old palace and the Herzog Max Burg, now used as public offices; the post office; the central station (1880); the chief customs house (1876-79); and the new palace of justice (1897). Buildings connected with art embrace the gallery of sculpture, or Glyptothek, an edifice of the Ionic order, containing a series of the finest ancient and modern sculptures; the Old Pinakothek or picture-gallery (1826-36) another beautiful edifice, containing one of the richest collections of pictures in the world; the New Pinakothek, adorned externally with frescoes and containing only paintings by recent masters; the academy of arts, an imposing building in the renaissance style; the academy of the plastic arts (1885); the Schack Gallery of paintings (1894), named from its donor; the Schwanthaler and Kaulbach museums, etc. The Crystal Palace (1854) is used for the annual art exhibitions. Other collections are the Hof-und-Staats Bibliothek, with 1,100,000 printed volumes and over 50,000 MSS.; the old Bavarian national museum, now used for art collections; the new Bavarian national museum (1899), etc. The German Museum is in all probability the finest museum of technology and the physical sciences in the world. The chief theatre is the Royal and National Theatre, with a lofty Corinthian portico. Munich is rich in monuments, which adorn its squares, gardens and public promenades. Among the chief are the monument of Maximilian II, with his statue 26 feet high, and the colossal bronze statue of "Bavaria," 65 feet high. It is a hollow female figure, designed by Schwanthaler and cast from foreign cannon. From the head a fine view of the city and the Alps is obtained. It stands on a low eminence in front of the "Hall of Fame," a Doric building of horse-shoe shape, containing busts of notable Bavarians. The "Gate of Victory," in imitation of the arch of Constantine at Rome, and the Propylæa, in imitation of that at Athens, should also be mentioned. There is a fine statue of Maximilian I by Thorwaldsen, and statues of Schiller, Gluck, Schelling, Fraunhofer and Gärtner, a bronze monument to the Bavarian soldiers who died in the war with Russia and a monument to the chemist Liebig. The Hofgarten is a garden near the palace, finely planted, and surrounded by an open and richly ornamented arcade; the so-called English Garden is an extensive and beautiful park. The cemeteries of Munich are noteworthy for their artistic tombs, probably the most beautiful in Europe. The ecclesiastical buildings, include the cathedral or Frauenkirche, founded in 1488, a vast pile, entirely of brick, with two lofty towers, terminating in domes 333 feet high; Saint Michael's or the Jesuits' Church (1583), a handsome Italian structure; the church of the Theatines, another Italian structure, beneath which are the burial vaults of the royal family; the church of Saint Louis, a modern building of brick, faced with white marble, decorated externally with statues by Schwanthaler, and internally by the finest frescoes of Cornelius; the church of All Saints; the basilica or church of Saint Boniface; the Marienhilf church on the right side of the river; the three Protestant churches; and the Jewish synagogue. At the head of the educational institutions is the university. (See MUNICH,

UNIVERSITY OF). Closely associated with it are the university library with 600,000 volumes and 2,500 manuscripts, together with 3,000 incunabula; the Collegium Georgianum (1494), a priests' seminary; the Maximilianum (1852), etc. There is also a high school of technology and numerous other high class institutions for educational purposes. The industrial development of Munich lags behind its æsthetic development. Its stained-glass works, iron, brass and bell foundries, lithographing and engraving works and manufactories of optical and mathematical instruments and various artistic articles, are, however, deservedly noted. Still more famous are the enormous breweries of Bavarian beer, which annually produce about 49,000,000 gallons, of which 37,000,000 are consumed in the city itself. The brew-houses and beer-gardens are world famous. Munich carries on a large trade in grain and in objects of art.

In 1158 Henry the Lion raised the *Vilh München* from its previous obscurity by establishing a mint and a salt-emporium within its precincts, the name (also appearing as *Lorin*, *ad Monachos*) being derived from the monk who owned the site. In the 13th century the dukes of the Wittelsbach dynasty selected Munich for their residence and fortified the town. In 1327 the old town was nearly destroyed by fire, and was rebuilt by the Emperor Louis the Bavarian; it was not until the fortifications were razed at the close of the 18th century that the limits of the town were enlarged to any extent. The true history of modern Munich is the account of its artistic development in the 19th century, closely identified with which are Klenze and Gärtner, the architects, Schwanthaler, the sculptor, Cornelius and Kaulbach, the painters, and Wagner, the composer. The modern Munich school of painting, headed by K. von Piloty, W. Diez and Grützner, is characterized by marked realism in color and detail, in contrast to the romanticism of the older masters. Because of its elevation and proximity to the Alps, Munich is subject to sudden and pronounced changes of temperature. The Republic of Bavaria (now extinct) was proclaimed here 8 Nov. 1918, and here, on 30 Sept. 1938, was signed by Germany, Italy, Great Britain and France the agreement that eventually doomed Czechoslovakia. See also SECOND WORLD WAR, Vol 28 p. 782 et seq. Pop. (1939) 828,325.

MUNICH, University of, a German institution located at Munich, Bavaria. It was founded in 1472 by the Bavarian duke, Ludwig the Rich, after he had received (1459) the necessary dispensation from Pope Pius II. (Piccolomini). The university was at first located in Ingolstadt, on the Danube, where it won high repute from the important humanists who taught in its classes—Celtis, Aventin, and Agricola. During the Reformation period the university gained a European significance through its rector, Johannes Eck, the opponent of Luther.

During the Counter Reformation it stood for a time under the influence of the Jesuits, who were fiercely opposed by the society of the *Illuminati* founded at the university. Goethe also belonged to this society. As a consequence of the Napoleonic wars, the university was removed, under King Maximilian I, to Landshut in 1800. Here, in the circle of the German Romantics, it played an important spiritual

historical role. Under King Ludwig I. of Bavaria the university was moved to Munich in 1826. In this location it quickly became one of the most important cultural centers of German research and education. Then followed a wide expansion in the domain of natural science (Röntgen). There are also faculties of law, medicine, economics, government, etc. at the university, and many seminars and modern lectures are conducted here. It has a botanical garden, several museums, laboratories, and an observatory. It has access to the libraries, museums, and art galleries of the city. The university library contains some 200,000 volumes, numerous pamphlets, valuable records, and medieval manuscripts. The teaching staff numbers 550; the average number of students enrolled is 7,000.

DR. FREIHERR VON POELNITZ,
Rector, University of Munich.

MUNICIPAL ACCOUNTING IN THE UNITED STATES. Accounting is the art which provides the principles and rules for the classification, summarization, and presentation of financial data. Municipal accounting is the application of the art to the financial transactions of municipalities. The term «municipalities» is used here to denote any governmental unit below or subordinate to the state. Examples are counties, townships, cities, towns, and villages, school districts, and park districts.

Most accounting principles apply alike to municipalities and private enterprises. One of the main differences is that a municipality is not operated for profit. Consequently, the accounting system of a municipality, unlike that of a private enterprise, is not designed to show whether the operations have resulted in a profit or loss. On the other hand, a municipality is subject to legal restrictions; its accounting system must, therefore, provide for the classification and recording of the financial data in such a manner as to show compliance with the applicable provisions of statutes, charters, and ordinances. Common aims of the two accounting fields are: (1) to show financial condition, (2) to account for changes in financial condition, (3) to gauge the efficiency of operations, and (4) to insure that (a) the private enterprise or municipality receives all the revenues to which it is entitled, (b) expenditures are made for authorized purposes only, and (c) cash or other assets are not misappropriated.

History.—Names of taxpayers together with the amounts due from them and data relating to receipts and disbursements were the only financial data that the early accounting systems produced. Moreover, no attempt was made to classify properly the meager financial information. The movements for improving municipal accounting have aimed at (1) developing principles, (2) obtaining more financial data, and (3) having these data properly classified as an aid both to the municipality itself in the preparation and execution of the budget and in the preparation of national municipal statistics. Although many of the movements aimed at improving municipal reporting, it was realized early that reports are only as good as the accounting records from which they are derived.

The first attempt at improving municipal accounting was made by Indiana in 1852 when it passed a law establishing state supervision over county accounts. Other states soon followed, and

state supervision of municipal accounting has continued to grow. The quality of such supervision has not been the same in all states, and consequently the degree of improvement has varied.

The National Municipal League was among the first nongovernmental agencies to attempt to improve municipal accounting. It not only took the lead in getting other organizations interested in the subject but made some notable contributions of its own. In 1897, the league prepared a classification of accounts for municipalities. This classification was adopted within the next few years by the states of Ohio and New York for their municipal reporting forms, by the United States Bureau of the Census for compiling comparative municipal financial statistics, and by many municipalities.

A «National Fund for Promoting Efficient Municipal Accounting and Reporting» was established in 1910 by Herman A. Metz, a former controller of New York City, to be administered by the New York Bureau of Municipal Research. The bureau published a series of bulletins called *Short Talks on Municipal Accounting and Reporting* and distributed them to mayors, accounting officers, and to other persons and organizations interested in the advancement of municipal administration. The «talks» were published in book form as *A Handbook of Municipal Accounting* (New York 1913).

The next major step to improve municipal accounting was taken in 1934 with the organization of the National Committee on Municipal Accounting. This committee is composed of representatives from accounting, governmental, and citizens' organizations. The Committee has conducted extensive research and has issued publications dealing with accounting principles, classification of accounts, terminology, and statements (see *Bibliography*). The committee's classification of accounts has been adopted by the United States Bureau of the Census. Due to a large extent to the efforts of the Municipal Finance Officers Association, the committee's recommendations have been made known to and have been adopted by many municipalities. Methods employed by the association include conducting schools for finance officers, publication of procedural manuals and pamphlets embodying the committee's recommendations, and reviewing financial reports of municipalities.

Accounting Organization.—The accounting organization of a medium size or large municipality consists of three principal units: (1) systems, (2) pre-audit, and (3) bookkeeping. The systems unit designates the methods of accounting to be followed by all departments, prescribes the records to be kept, and provides for standardized accounting documents such as purchase orders, invoices, and payrolls as well as forms of reports. It reviews from time to time the methods, records, and reports with a view of improving them. On this unit rests the responsibility of seeing that the accounting principles and rules are being given effect and that the accounting system produces the desired information accurately, promptly, and at the lowest possible cost. Sometimes outside consultants are called in, particularly if major changes are to be made.

The pre-audit unit has two functions. First, it checks the financial transactions to see that they are in order. For example, it sees that the

materials being paid for have actually been received and that the quantity, quality, price, and other conditions under which commodities or services have been furnished to the municipality are as agreed upon. Second, it designates, on the basis of the rules set up by the systems unit, in which records and accounts each transaction is to be reflected.

The bookkeeping unit records the transactions. Bookkeeping, as distinguished from accounting, is a mechanical process. The bookkeeper is not called upon to determine the propriety of the transaction or to classify it for recording. All he or she does is to follow the instructions indicated by the pre-audit unit. This unit also takes off trial balances and prepares some of the financial statements. The forms for such statements are designed by the systems unit; the bookkeeping unit merely fills in the information called for.

Supervising all of these units is the head of the accounting department. He is responsible for all phases of the accounting and bookkeeping work. In a large organization, his work is primarily supervisory. In a small organization, he does all of the work performed by the systems unit of a large municipality. Sometimes he is even called upon to do the pre-audit work.

Accounting Records.—A municipality's records, like those of a private enterprise, are classified into (1) accounting documents, (2) books of original entry, and (3) ledgers. Examples of municipal accounting documents are tax bills, licenses, receipt forms, vouchers, and checks. As in a private business, books of original entry are used to classify the information for posting to the accounts. Examples of municipal books of original entry are (1) a cash receipts register—to record receipts; (2) a voucher register—for recording accounts payable and classifying the accounts to be charged; (3) a check register—for checks issued; (4) payroll registers—to list the names and earnings of employees; (5) a bond and interest register—to show the legal history of each bond issue together with the amount of interest and principal to be met each period; (6) a general journal—to enter transactions not recordable in any other book.

Every municipality must have a general ledger and subsidiary ledgers. The general ledger contains all of the principal accounts. Subsidiary ledgers carry the accounts which support and are controlled by the principal accounts in the general ledger. Examples of municipal subsidiary ledgers are: (1) Revenue ledger. An account is provided in this ledger for each revenue source showing both actual and estimated revenues. (2) Appropriation expenditure ledger. This ledger contains an account for each appropriation to show the amount appropriated, expenditures, encumbrances (purchase orders or contracts), and the unexpended and unencumbered balances. (3) Tax ledgers contain an account for each taxpayer showing the amount billed, the amount paid, and the balance, if any, receivable. (4) Special assessment ledgers carry an account for each assessment payer showing the amount originally receivable, amount paid, and balance. (5) Bond and interest ledger. A separate account is provided to show bonds and interest originally payable, amounts paid, and balance. (6) The property ledger contains an account for each fixed asset owned by the municipality.

Bases of Accounting.—There are two prin-

cipal bases of municipal accounting, cash and accrual, although in practice some combination of the two is frequently found. Under a strict cash basis, revenues are accounted for only when received in cash, and expenditures are accounted for only when paid. Under a strict accrual basis, revenues are accounted for when earned, or in the case of taxes and similar levies, when bills are rendered, and expenditures are accounted for as soon as liabilities are incurred.

The accrual basis is the more accurate because it recognizes transactions when they take place, regardless of when the cash is received or paid. Cash must, however, be taken into consideration even by a municipality which operates on an accrual basis. In the first place, only those taxes and other receivables should be considered as revenue which will be converted into cash within a reasonable period of time. What is a reasonable time must be considered in the light of the particular circumstances, but it would probably be more than one year. Secondly, in planning the municipality's expenditures, if short-term borrowing is to be avoided, it is not only important to consider revenues but cash receipts as well.

Appropriations and Funds.—As pointed out earlier, one of the distinctions between municipal and private accounting is the necessity of giving effect in the municipal accounting system to legal restrictions. Two examples are appropriations and funds. An appropriation is an authorization granted by the legislative body to make expenditures and to incur obligations for specific purposes. The budget is adopted by means of a legislative act known as an appropriation ordinance or resolution. This ordinance specifies the maximum amount which may be spent during the budget period by each organization unit for specific purposes. The accounts must show the amount appropriated for each organization unit, the amount of expenditures and encumbrances charged to the appropriation, and the unexpended and unencumbered balances. The appropriation expenditure accounts are used not only to show the status of appropriations but also to prevent the overexpenditure of appropriations.

The National Committee on Municipal Accounting has defined a fund as "a sum of money or other resources (gross or net) set aside for the purpose of carrying on specific activities or attaining certain objectives in accordance with special regulations, restrictions, or limitations and constituting an independent fiscal and accounting entity." An appropriation represents a restriction of expenditures to be made out of a fund. If there were no appropriations, all the money flowing into a fund could be expended immediately for any activity financed from such fund. An appropriation restricts these expenditures further by indicating which organization units are to spend the fund resources, the amount to be spent by each unit, and the time during which the expenditure may be made (usually a year). Ordinarily, several appropriations are made out of a fund.

In municipal accounting, as distinguished from commercial accounting, a fund represents not only a restriction of money but also an independent accounting and fiscal entity. Each fund is considered a separate and distinct enterprise, and accounts are set up to show the fund assets, liabilities, reserves, surplus, revenues, and ex-

penditures. In many cases, even a temporary loan cannot be made by one fund to another fund within the same municipality. The degree to which a fund is restricted depends on the legal provisions under which it is set up and the authority creating it. For example, if a fund is called for by a charter provision, no changes can be made until that section of the charter is amended. On the other hand, if the fund is set up by the city council, that body can increase, decrease, or abolish it.

Classification of Funds.—To facilitate the use of funds not only as means of complying with legal provisions but also as an aid in financial administration and in the preparation of uniform financial statistics, the National Committee on Municipal Accounting has proposed the following classification of funds: (1) General fund, (2) Special Revenue funds, (3) Working Capital funds, (4) Special Assessment funds, (5) Bond funds, (6) Sinking funds, (7) Trust and Agency funds, and (8) Utility funds. The general fixed assets and the general bonded debt of a municipality are not included in any fund but are each set up in a separate self-balancing group of accounts.

The *General* fund is the most important fund of the municipality. It is used to account for the financing of activities not handled through any other fund. It receives a greater variety of revenues than any other fund and finances more activities than any other. In general, most of the current operations of the municipality are financed from this fund. Its principal assets are cash, taxes receivable, and amounts due from other governmental units or from other funds of the municipality. Its liabilities consist of accounts payable, judgments payable, matured bonds and interest payable, and amounts due to other funds of the municipality.

Special Revenue funds are used to account for revenue derived from specific taxes or other special sources, usually provided by statute or charter to finance special activities. For example, if the statutes provide for a special tax levy to finance recreational activities, a special fund must be established to account for such taxes. The most important assets of the fund ordinarily are cash and taxes receivable, and fund liabilities consist of accounts payable.

Working Capital funds are established to finance those activities which one department or bureau renders for other departments of the municipality. Examples are a central garage and a central purchasing and stores bureau. The fund operates as follows: fund capital is provided either by the General fund or by a special tax levy. Capital is used to acquire equipment and to meet the initial expenditures for material and labor. Departments are charged with the cost of the services rendered for them and at periodical intervals they replenish the fund by the amount expended for their benefit. The revenues of the fund consist of charges made to departments for services; the expenditures, of amounts spent for material, labor, and equipment. Fund assets are cash, amounts due from other departments, inventory of materials and supplies, and fixed assets. Liabilities consist primarily of accounts payable.

Special Assessment funds are used to finance permanent improvements (e.g., the construction of streets) or services (e.g., street oiling) payable wholly or in part from special assessments levied

against benefitted property. Permanent improvement assessments are usually payable in installments over a number of years. The improvement is constructed in a year or two, by which time only one or two installments have been collected. Construction is, therefore, financed by issuing bonds which are retired from special assessment collections. The Special Assessment fund is consequently used to account not only for special assessments but also for special assessment bonds. The important assets of the fund are cash and assessments receivable. The important liabilities are amounts due contractors and bonds payable.

Bond funds receive and disburse the proceeds of all bonds issued by the municipality, except special assessment and utility bonds, proceeds from the latter two being handled through Special Assessment and Utility funds, respectively. For example, a bond issue floated to finance the construction or purchase of improvements is handled through a Bond fund. A separate Bond fund may be established for each bond issue, or all the bonds may be accounted for through one Bond fund, providing supporting records are set up to show the receipts, expenditures, and unexpended balances of each bond issue. Fund assets include cash and bonds authorized but unissued. The liabilities consist of accounts payable.

Sinking funds handle money and other resources being accumulated for the retirement of term bonds. A Sinking fund should not be used to retire serial bonds or to pay the interest on either serial or sinking fund bonds. The retirement of serial bonds or interest should be handled through the General fund or through a Special Revenue fund. The reason is that Sinking fund statements show not only the amount of cash or other resources in the fund at any particular time, but also the amount which *should be* in the fund at that time. The required amount is predetermined on an actuarial basis which takes into account not only the annual contributions to the fund but also the compounded earnings on the contributions.

At the beginning of each year, an account "Reserve for Sinking Fund Bonds" is increased by the required contributions and earnings for that year. At the end of the period, if the amounts actually contributed and earned are as anticipated, the assets of the fund will exactly equal the reserve. If greater than anticipated, the amount of assets in the fund will be greater than the balance in the reserve. The difference represents the amount of fund surplus. If contributions or earnings are smaller than anticipated, total fund assets will be smaller than the balance in the reserve. The difference represents the amount of the fund deficit. The reserve thus shows the financial condition of the Sinking fund. If the fund is used to retire both serial and sinking fund bonds or to pay interest, a confusing element is introduced. The assets of a Sinking fund consist of cash, taxes receivable, and investments. Usually, it has no liabilities.

Trust and Agency funds are used to account for money and property received and held by the municipality as trustee or custodian, or in the capacity of an agent, for certain individuals or governmental units. The difference between a Trust fund and an Agency fund is that the former exists over a longer period of time than an Agency fund and presents additional administrative problems, an example being the investment

of Trust fund assets. The same accounting principles and procedure apply to both of them so that Trust and Agency funds are considered one class of funds.

Trust funds are classified as public and private. A Public Trust fund is one which must be used for a public purpose; for example, public employees' pension funds. Private Trust funds, on the other hand, are those which will ordinarily revert to private individuals or will be used for private purposes. An example is deposits placed by contractors with a municipality to guarantee the fulfillment of contracts.

Trust funds are also classified as expendable and nonexpendable. Expendable funds, as their name implies, are those the principal and income of which may be expended. A pension fund is an example of an expendable fund; ultimately, the fund is used to pay pensions. Nonexpendable funds, on the other hand, are those whose principal must be kept intact. An example is a loan fund. Although loans are made out of the fund, these loans must be repaid so that the fund will be restored to the original amount. Trust and agency fund assets are cash, investments, and loans, and taxes receivable; liabilities consist of the fund balances being held for others.

Utility funds are established to account for the financing of self-supported enterprises which render services primarily to the public. The distinction between a Utility fund and a Working Capital fund is that a Working Capital fund finances activities rendered by one organization unit for other organization units of the same municipality whereas a Utility fund finances services rendered primarily to the public for compensation. Examples of utilities are municipally owned water works, electric plants, gas plants, and central heating systems.

A municipal utility should be accounted for on the same basis as a similar privately owned enterprise. For example, the accounting system must be designed to show whether or not the utility is being operated as a self-supported enterprise. In fact, municipal utility accounting belongs more in the realm of commercial than municipal accounting. Frequently, however, a municipal utility is, erroneously, subjected to the same restrictions as any other municipal fund. In that case, the utility, if it is to produce the necessary information, must in effect set up two accounting systems—one to show its financial condition and operations and the other to indicate compliance with legal provisions.

General fixed assets are all of a municipality's fixed assets except those financed from Working Capital or Utility funds. If these assets were the means of producing revenues, it would be necessary to depreciate them and to charge depreciation against revenues. In that event, the assets would be included in the fund from which they were financed so that their depreciation could be reflected in the fund's financial operations. This is true, for example, in the case of Working Capital and Utility funds. Since, however, a municipality's general fixed assets are not the means of producing its revenues, no useful purpose is served by including them in the funds from which they were financed. On the contrary, such inclusion might lead some readers to assume that the surplus represented by the fixed assets is available for further expenditure. Accordingly, general fixed assets are set up in a separate group of accounts.

General bonds include all bonds except those payable from Special Assessment funds or Utility funds. General bonds are ordinarily payable from taxes and from earnings on Sinking fund contributions. Since the funds which receive the proceeds from the sale of the bonds are not the ones whose resources will be used to retire such bonds, general bonds are not shown as part of any fund but are set up in a separate group of accounts. On the other hand, special assessment bonds and utility bonds, since they are payable from the resources of the Special Assessment fund and Utility fund, respectively, are shown as liabilities of these funds.

Classification of Accounts.—The accounts of each fund affected by budgetary restriction may be classified according to whether they are budgetary accounts or proprietary accounts. Budgetary accounts are those necessary to reflect budgetary operations and condition, such as estimated revenues, appropriations, and encumbrances. Proprietary accounts are those which show actual financial condition and operation such as actual assets, expenditures, etc. Some times, however, the same account may serve as both a budgetary account and a proprietary account. For example, an appropriation expenditure account shows an actual financial operation (that is, the amount actually expended), and a budgetary operation (the amount by which the appropriation is to be reduced).

Fund accounts are also classified according to whether they are balance sheet or operating statement accounts, that is, whether they go to make up the fund balance sheet or fund operating statements. Balance sheet accounts are further subdivided into asset, liability, reserve, or surplus accounts. As is evident from the description of funds above, the assets and liabilities of each fund vary with the type of fund. Operating statement accounts are subdivided into revenue accounts and expenditure accounts.

A distinction must be made between fund revenues and revenues of the municipality as a whole. A fund revenue may not necessarily be revenue to the city. For example, proceeds from the sale of bonds are a revenue of the Bond fund but not of the city. They are a revenue of the Bond fund because the bonds will not be paid from this fund but from taxes. On the other hand, the proceeds are not revenues of the city as a whole because the municipality is obligated to pay the bonds.

Similarly, an expenditure of a fund may not be an expenditure of the municipality as a whole. For example, if the General fund contributed money to the Working Capital fund, the amount contributed is considered an expenditure of the General fund because the General fund thereby suffers a reduction in its assets. The contribution is not an expenditure to the municipality as a whole because the reduction in the assets of the General fund are offset by a corresponding increase in the assets of the Working Capital fund.

The distinction is important in compiling and interpreting financial statistics of different municipalities, an example being the financial statistics of cities, published by the United States Bureau of the Census. In preparing these statistics, fund distinctions must be ignored, and like revenues and expenditures must be combined regardless of the funds in which they originated. Retaining all fund distinctions would make cor

comparative statistics an impossibility. For example, one city may account for all general activities through the General fund while another may have them divided between the General fund and several Special Revenue funds.

On the other hand, from the standpoint of the individual municipality, the identification of revenues and expenditures with the funds to which they apply is fundamental. Otherwise the municipality would not be in a position to know if it is complying with legal provisions. The classifications of revenues and expenditures described below are considered from the standpoint of both the individual funds and uniform municipal financial statistics. Some of these revenues and expenditures are found in only one fund, whereas others are common to several funds.

Revenues are classified by source. The principal municipal revenue sources include general property taxes; licenses and permits; fines, forfeitures, and penalties; revenue from use of money and property, e.g., interest earnings, rents, and concessions; revenue from other agencies, including state-collected locally shared taxes, state grants-in-aid, grants from the federal government, and grants from the county or other local units; charges for current services; special assessments; and earnings of public utilities. From an individual fund standpoint, bond proceeds are also revenues.

Expenditures are classified by *function, organization unit, activity, character, and object*. A function is a group of services aimed at accomplishing a certain purpose or end. Municipal functions include general government, public safety (including police and fire), highways (that is, repair and construction of streets and roads), sanitation and waste removal, conservation of health, hospitals, charities, correction, schools, libraries, recreation, and public utility operations. The foregoing are the main classes of services rendered by a municipality. Of course, some municipalities may not render all of these services. For example, some do not own utilities.

Each organization unit within a municipality carries out a part of a function. The primary subdivision of a function is designated as an activity, and the subdivisions of the activity are known as subactivities. For example, the function of public safety involves among other principal activities those of policing and of fire prevention and fire fighting. The policing activity may be subdivided further into such subactivities as personnel training, crime prevention, activities of detectives, activities of uniformed police, and maintenance and operation of the police communication system. Theoretically, an organization unit should carry on activities which are a part of one function only. Actually, however, one organization unit may carry on activities which belong to different functions. For example, a public works department may construct and repair streets (activities relating to the "highways" function) and also clean the streets (an activity belonging to the "sanitation and waste removal" function).

Comparative financial statistics on expenditures of municipalities are reported by functions. The reason is that variations in the organization structures of municipalities make it impracticable to compile statistics by organization unit. On the other hand, the expenditures as they actually take place are recorded by organization

unit. This procedure makes it necessary for compilers to group the organization units and their activities by functions, and in that way arrive at the total expenditure for each function.

Expenditures are also classified by character, that is, on the basis of the periods presumed to be benefited. The three main groups in this classification are expenses, provisions for the retirement of debt, and capital outlays. Expenses are presumed to benefit primarily the current fiscal period. Provisions for the retirement of debt involve expenditures on account of benefits received, at least in part, in prior fiscal periods, although their benefits may extend to the present period and future periods. Capital outlays represent expenditures for durable assets, the benefit of which applies both to this fiscal period and to some subsequent period or periods.

Both current expenses and capital outlays are further classified by object, that is, on the basis of the nature of the article purchased or service obtained. In some municipalities, the object classification is very detailed; in others, it consists of only a few items. The following is a complete object classification composed of only five objects: (1) personal services, (2) contractual services, (3) materials and supplies, (4) interest charges, and (5) sundry charges. No one object classification can be said to be ideal. The detail with which the expenditures should be broken down by objects will depend on the requirements of management and on legal provisions.

The above object classification applies equally to current expenses and capital outlays. In practice, however, capital outlays are not reported by these detailed objects. The reason is that since some of the fixed assets are purchased, the outlay for them cannot be classified as personal services, contractual services, etc. The only way such purchases can be classified is to show the complete object acquired, e.g., land, buildings, improvements, or equipment. To be consistent, therefore, fixed assets constructed by the municipality, even though they are recorded by detailed objects, must be classified by main objects, e.g., buildings, equipment, etc.

The classifications by character and object are not separate groupings but represent a further subdivision of the activity classification. The following is an example of a complete classification for one activity, namely, registering voters.

General Government (*function*)
 Board of Elections (*organization unit*)
 Registering Voters (*activity*)
 Current Expenses (*character*)
 Personal Services (*object*)
 Contractual Services (*object*)
 Materials and Supplies (*object*)
 Capital Outlays (*character*)
 Equipment (*object*)

Although many functions and activities are financed through the issuance of bonds, no attempt is made to allocate the outlay for debt retirement and interest among the several functions. Instead, interest payments are shown as a separate item under current expenses, and debt retirement as a separate item under capital outlays.

Classification of Financial Statements.—Municipal statements may be classified as (1) accounting and (2) statistical. An accounting statement is one prepared directly from the accounts, ordinarily contains no other data except those taken directly from the accounts, and usu-

ally covers a period of one or two fiscal years. Statistical statements, on the other hand, may cover a period of more than two fiscal years or may contain, in part, data not related to accounting. The purpose of accounting statements is, among other things, to show compliance with legal provisions and fund accountability. Statistical statements show financial trends and the present and prospective financial ability of the municipality to finance its program.

Accounting statements are classified into balance sheets and operating statements. A separate balance sheet must be prepared for each fund or group of related funds, with subsidiary schedules set up for those balance sheet accounts requiring further explanation. Since each fund is an independent entity, it is incorrect to present a balance sheet in which like assets or liabilities of different funds are combined. If a combined balance sheet of all funds is desired, it must be so set up that the assets, liabilities, reserves, and surplus of each fund are exhibited in the same statement.

Similarly, a separate operating statement or statements must be prepared for each fund. It is improper to present a combined statement of revenues and expenditures for all funds for several reasons. First, as explained earlier, fund revenues or expenditures may not necessarily constitute revenues or expenditures of the city as a whole. Second, in the case of some funds, no comparison is made of the revenues and expenditures within the same fund. For example, revenues and expenditures of Special Assessment funds for a fiscal year cannot be compared because the assessments are levied in one period, whereas the expenditures may be spread over several periods. Third, each fund is an independent entity, and the revenues of one fund cannot be used to finance the expenditures of another, unless authorized by law.

Statistical statements present a financial history of the municipality together with forecasts of future financial requirements. All factors relating to the property tax should be reflected in the statistical statements. For example, they should show the assessed valuations, tax rates, tax levies, and tax collections for a number of years. They should indicate the amount of shared state taxes and grants received by the municipality for a number of years. Information should also be shown regarding the municipality's debt such as (1) the ratio of bonded debt to assessed value and the per capita bonded debt for a number of years, (2) the amount of debt which the municipality is authorized to incur after taking into account the bonded debt outstanding, (3) the debt of overlying jurisdictions (such as school districts, county, townships, etc.) which the taxpayers of the municipality will have to pay, and (4) the amount of interest plus contributions to sinking funds or retirements of serial bonds that will have to be made each year until all the present outstanding bonds are retired.

Conclusion.—The ultimate aim of an accounting system is to provide financial information which can be embodied in reports to legislators, administrative officials, and the public. The report must serve a dual purpose: (1) It must show compliance with legal provisions. (2) It must reflect in proper form the financial condition and financial operations of the municipality. The same consistent principles must be

applied from year to year so that the financial statements of one year can be compared with those of another year. If changes become necessary, they must be explained and their effect must be indicated. A uniform terminology must be employed in all reports, and unusual terms must be explained. In general, in determining whether or not a municipality has a proper accounting system, the test is: Can the system produce accurate and informative reports promptly at the lowest possible cost?

MUNICIPAL ART SOCIETIES.—See ART, AMERICAN.

MUNICIPAL COLLEGES AND UNIVERSITIES. *The United States.*—The passion for free public education in the United States has carried well beyond the original intention. At first only the elementary school was free; tuition was free, and the schools were maintained by public taxation. Secondary education was then conducted by private academies and higher education by privately endowed colleges and universities. But before the free elementary school had become universal, free high schools were opened and maintained in the more progressive communities and by the close of the 19th-century the free public high school was practically the uniform policy of public education in every state of the United States. Opposition to such free secondary education in tax-supported schools has entirely disappeared. Most of the states have established universities, supported entirely by taxation and offering free tuition to residents of the state. The municipal college and university, therefore, has grown out of the city high school in response to the public demand for higher education.

England.—England has a type of municipal college but they are not tax supported and, therefore, are not municipal institutions in the truest sense. Nevertheless, although on private foundations and maintenance, many of these English colleges are of local character, reflecting the local industries, local ideals, local pride. Thus the Sheffield College reflects the cutlery interests by its excellent school of metallurgy. The College of Leeds reflects the textile indus-

ries by its school of textiles. Birmingham, Liverpool and Manchester have local universities. The University of London has a long and honorable record.

MUNICIPAL DEBTS. Among those who deal in securities the term "municipals" is used to denote bonds or other evidences of indebtedness of states, cities, counties, school districts, and other public bodies.

Municipal debts may take the form of long-term loans through the issuance of bonds or they may be short-term obligations such as warrants, bank overdrafts, or tax anticipation notes. Long-term bonds are called *serial bonds* when approximately the same amount of the principal is paid each year. *Sinking-fund bonds* are usually payable at a single date, such as twenty years from the time of issue, and the money to pay them is accumulated over the period in such a way that early contributions with the interest they earn will pay the debt at maturity.

Serial bonds are now generally favored over sinking-fund bonds by investors and legislators. Several states permit their municipalities to issue serial bonds only.

Municipalities may borrow in anticipation of the collection of taxes. These short-term loans may be necessary because the taxes are not due until long after the fiscal year begins. Loans of this character may be warrants or notes sold to financial institutions, or they may be issued to subscribers in settlement of claims. They usually bear interest. Sometimes they are recorded in numerical order of their issuance or presentation and they are then called registered warrants. Canadian cities finance short-term loans by bank overdrafts on which they pay a stated rate of interest.

Municipal debts in the United States presented no special problems until after the Civil War. New York City sold some securities about the year 1812 and by 1822 Boston's debt was \$100,000. By 1843 the total municipal debt amounted to about \$27,500,000 according to the report of a congressional committee. The federal debt at that time was even smaller, about \$20,000,000, while the debts of the states aggregated more than \$230,000,000. After 1860 the municipal debt grew rapidly. It reached the \$500,000,000 mark in 1870 and totalled \$15,000,000,000 in 1932. The growth of municipal debt, both as to time and location, paralleled the growth of cities.

Two types of municipal bonds have caused widespread difficulties. Railroad-aid bonds sold in the middle of the 19th century and special assessment bonds issued during the 1920's have caused many defaults and partial repudiations. General-obligations bonds have the best record of payment over a long period of years. The railroad-aid bonds were sold by cities or counties to help finance railroads as a condition to running the railroad through the city or county. Such bonds were often issued illegally and this was used as an excuse to refuse payment. As a result of such refusal present purchasers of municipal bonds of all types require the approving opinion of an attorney who specializes in municipal bond law.

Special-assessment or local-improvement bonds were sold by municipalities in the 1920's to finance the construction of sewers, pavements, sidewalks, and water mains in growing urban and suburban areas. In many cases the bonds

were primarily a debt against the property benefited. However, when the special assessments were not paid the bonds became a debt of the entire city. In these cases the whole city took on a heavy burden. Other types of special-assessment bonds were payable solely from the collection of special taxes and when these assessments were not paid the bondholders could not get their money.

During the years 1930-1940 scores of municipal districts delayed payment of their debts. However, the record of ultimate payment was excellent and excelled only by the record of the United States government itself. Total losses to investors were far less than one per cent of the total debt.

Control of Municipal Debt.—Several controls exist to limit municipal debts. Nearly all limits are based on a percentage of the assessed value of property in the municipality. Thus municipal corporations in Illinois may not incur debts beyond 5 per cent of the assessed value of property in the city. Some limits are fixed by state constitutions, some in general state statutes and others in city charters. Municipal debts are limited by several means:

- (1) Express authority to borrow must be given by the state.
- (2) Debts may be incurred only for public purposes.
- (3) Definite limitations exist for nearly every type of governmental unit.
- (4) Some municipalities may issue bonds only after the approval of the electors. Other require only positive action of the municipal council. Still others may have to obtain the approval of a designated state agency.

Peculiar Characteristics of Municipal Debt.—Bonds issued by municipalities have been sought, since enactment of the income tax law, by persons of large income who wish to have their incomes free from federal taxes. The courts and the statutes, as well as precedent, have exempted from federal income taxes, the income from state and municipal bonds.

Municipal bonds are paid from taxes levied for that purpose. The bonds do not pledge as security the physical properties of the municipal corporation nor the property of the citizens. This contrasts with many corporate bonds which are secured by a mortgage on the corporations' properties. While the municipality does not pledge any property for the payment of its general obligation bonds it does agree to levy unlimited taxes to pay the principal and interest on the debt.

Volume of Debt.—Statistics on municipal debt, issued by the United States Bureau of the Census show the following gross debts as of June 30 each year:

	Total (All amounts are in millions of dollars)	State Debt	Local Debt
1912	\$ 4,498	\$ 423	\$ 4,075
1922	10,256	1,163	9,093
1932	19,562	2,896	16,680
1940	20,201	3,526	16,720
1944	17,426	2,768	14,703
1945	16,552	2,425	14,164
1946	15,887	2,358	13,564

The state governments have kept their debts low. Their conservatism results from the fact that many state constitutions prohibit the government from incurring debt. This restriction on the states was brought about to prevent the states from repeating their spending for canals and banks as they did in the first half of the 19th century.

Revenue Financing.—The most significant development regarding municipal bonds is the widespread use of municipal "revenue" and "authority" bonds. Such bonds are issued to finance enterprises like water works, electric plants, sewage disposal works, and facilities such as bridges and tunnels. These bonds are usually payable solely from the earnings of an enterprise. They may be contrasted in this respect with general-obligation municipal bonds which carry a pledge of the "full faith and credit" of the municipality and for whose payment an unlimited tax levy is usually pledged. When a municipality fails to pay the interest or principal on its general-obligation debt the bondholders must take judgment for the matured debt, and obtain a mandamus compelling the municipality to levy a tax to satisfy the judgment. If there should be a default on revenue bonds payable solely from the earnings of an enterprise, then the bondholders may be able to force higher service charges or they may assume operation of the enterprise.

Interest Rates.—The interest rates on municipal bonds are lower than they are on any other type of security of similar maturity. This is due primarily to the fact that the income from the bonds is exempt from federal income taxes. Interest rates, and therefore interest costs, have gone down as the federal income tax rates have increased. On January 1, 1933, according to an index of such bond prices, the yield was 4.61 per cent. By April 1946 this had declined to 1.29 per cent but rose again to 1.85 per cent in February 1947. Tax exemption and the excellent history of payment of municipal bonds contribute to this low rate. Municipal-bond interest rates tend to rise and fall with general interest rates and more especially with interest rates on United States government loans.

CARL H. CHATTERS,
Executive Director, Municipal Finance Officers
Association of the United States and Canada.

MUNICIPAL GOVERNMENT. Early settlers in British North America brought with them the concept of the municipal corporation as a means of meeting the complex needs of densely populated places. However, there was little need in the colonial period for municipal corporations and only about a score of them were established, the most important being New York and Philadelphia. Independence gave a great impetus to the incorporation of cities. As a result of the rapid growth of population and the accompanying change from a predominantly agricultural to an industrial economy, the incorporated city has become the usual form of local government. In New England there are numerous urban communities still administered by the less formal town governments. Throughout the rest of the country certain areas adjacent to large cities, though to all intents and purposes urban, have

no local government except that of the county in which they are situated. Generally speaking, however, the more than 16,000 incorporated places include the great bulk of our urban population.

The United States census somewhat artificially defines as urban any city or other incorporated place with a population of 2,500 or more. In 1940 there were 3,464 such places, with 56 per cent of the country's population. While some cities of 2,500 are compact, densely populated areas, many present few urban characteristics. A line drawn at 5,000 more nearly represents the actual distinction between urban and rural. In 1940 there were 2,042 such municipalities, containing 69,397,791 inhabitants, or 52.7 per cent of the country's population.

The forms and functions of local government in places ranging in population from 5,000 to nearly 7,500,000, is the subject of this article. In all government in the United States, it is municipal government on which we depend chiefly for the preservation of order and protection from crime, fire and disease; it plays the major role in our educational system; it furnishes basic utilities such as water, light, power, and transportation; and it maintains and cleans the streets, and collects and disposes of refuse and sewage without which service urban life would be impossible.

Relation of Municipality to State.—The power to create municipal corporations belongs to the states. Except for such limitations on its powers as are contained in the federal and state constitutions, the state legislature can make and unmake them at will. The state legislature cannot empower a municipality to do anything which it is forbidden to do by the federal Constitution, such as deprive a person of liberty or property without due process of law. The protection accorded to individuals and private corporations by the first 10 and the 14th amendments to the federal Constitution does not limit the state's authority in establishing, combining, or abolishing municipal corporations, or in altering their powers and privileges. In other words, a municipality cannot invoke the federal Constitution against the state. As a result, such protection as a municipality has against arbitrary action by the state legislature must be found in specific provisions of the state constitution. In the absence of such provisions, and sometimes in spite of them, the legislature's power has been frequently abused, to the detriment of local self government.

The most common restriction on the legislature, in dealing with municipalities, is the requirement that it act by general law. The courts, however, holding that a law affecting a whole class is general, have in many instances permitted such minute classification of cities by population as to practically nullify the constitutional provision. Another and more effective means of giving municipalities greater powers of self-determination has been through optional acts which any city can adopt. Acts relating to specific subjects, such as planning and zoning, are common. Massachusetts offers five basic forms of government among which its cities, except Boston, may choose by referendum. Other states, including Idaho, Iowa, Kansas, Nebraska, New Jersey, New Mexico, New York, North Carolina, North Dakota, Ohio, South Dakota, Virginia, and Wisconsin, offer their cities similar alternatives.

Nine states (Maine, New Hampshire, Vermont, Rhode Island, Connecticut, Delaware, Georgia, Florida, and Tennessee) do not restrict the power of their legislatures to enact special laws for cities.

Eighteen states (Arizona, California, Colorado, Idaho, Maryland, Michigan, Minnesota, Missouri, Nebraska, New York, Ohio, Oklahoma, Oregon, Texas, Utah, Washington, West Virginia, and Wisconsin) permit some or all of their cities to prepare and adopt "home rule" charters. This can be the most satisfactory method of reconciling the right of the people of the city to self-government with necessary state control. Most home-rule charter provisions actually do give cities freedom to choose their form of government. Home-rule charters are otherwise subject to the general laws of the state except as to such powers as cities are permitted to exercise by the constitution. It is at this latter point that home rule is often crippled by too narrow a definition of powers which the city may freely exercise. Efforts of the last half century to encourage municipal home rule have not won for the municipalities much independence of the state legislature. It is true, however, that even where the practice of special legislation for municipalities is at its height, as in Connecticut, the legislature tends to defer to local opinion in adoption of such acts. In the "home-rule charter" states, changes in charters usually require a popular vote. See also MUNICIPAL HOME RULE.

Relations between Municipality and Federal Government.—It must not be supposed that because the municipalities are left by the federal constitution at the mercy of the states, that there are no relations between municipalities and the federal government. For a long time such relations as existed were mostly indirect, the national government approaching the cities through their state government. This is still true in such matters as grants-in-aid for highways, social security, and education. It is significant, however, that the Federal-aid Highway Act of 1944 set apart a definite portion of its grant for urban roads. The only exceptions to the general rule prior to the depression of 1930-1940 were such service activities as those of the bureaus of Standards, Mines, and of the Census. Early in the depression, the Reconstruction Finance Corporation began making loans for relief purposes directly to cities. Later, the work relief programs spent billions in immediate cooperation with local units. Public Works Administration loans were negotiated by the cities themselves, and, in the administration of housing, the federal government bypassed the states almost entirely. During World War II Lanham Act allotments and other funds were disbursed directly to cities on a very large scale. These were all emergency matters, but a deep path was worn between the city hall and Washington which in all probability will continue to be used for a growing variety of purposes.

Relations of Municipality with Other Local Government Units.—Almost all municipalities are parts of the counties in which they are physically located and county taxes are paid on all property within the cities, although, except for maintenance of courts, conduct of elections, registration of deeds, and the like, the county spends its money largely on the area outside the city limits. The exceptions to the rule that the municipality is part of the county are

very few. New York City contains five complete counties. Boston covers most of Suffolk County and pays all the county's bills, while the city council acts as the board of county commissioners. Philadelphia, Baltimore, San Francisco, St. Louis, New Orleans, and Denver are consolidated city-counties, and the same is true of all "first-class" (10,000 population or more) cities in Virginia. Elsewhere the rule prevails, and, whenever a county includes a large city, there is often overlapping overhead and conflicts of jurisdiction.

Metropolitanism.—City-county relations are only one problem of intercommunity relationship which municipalities face today. Whereas cities continued down to the late 19th century to be compact, closely built-up units in which population clung to the commercial and industrial nucleus, the typical modern city, at least from the social and economic point of view, is a sprawling metropolis embracing numerous independent local units. Annexation has failed (except in a few states like Virginia, where it is effected by court decree, or in Texas where unincorporated territory can be annexed by simple resolution of a city council) to keep pace with the expansion of city population. Examples drawn from the 1940 census figures illustrate this. Pittsburgh's population inside the city limits was 671,659. Its metropolitan area as defined by the census bureau had 1,994,060 inhabitants, including the whole or part of 6 counties, 82 townships, and 137 municipalities. The city of New Haven, Conn., had a population of 160,605, but the 10 towns and 6 cities of metropolitan New Haven had 308,228. Kalamazoo, Mich., had 54,097, but 23,116 more lived in 2 townships and 2 municipalities in its environs.

The census definition of a metropolitan area, which includes all adjacent and contiguous civil divisions having a population density of 150 per square mile, is questionable. The true metropolitan area in which there is a daily large-scale movement of population to and from the nuclear center may be smaller or larger than the census area, but this does not alter the essential fact that most municipalities of any size are but parts of a larger urban community. That political boundaries do not correspond with the real city in the socio-economic sense creates endless confusion and difficulty. The regulations of adjoining municipalities often conflict and the smaller units frequently cannot provide for themselves the kind of public works necessary in a metropolis. While there has been a great deal of talk of metropolitan consolidation, very little has been accomplished. There are a few metropolitan districts supplying water, sewerage, parks, or other specific service to several adjacent local units. In cases like Los Angeles, a county government has been entrusted, for the benefit of the municipalities as well as the unincorporated area, with some of the functions of government usually performed by each municipality for itself. On the whole, however, the problem of metropolitanism remains to be solved. The chief obstacle to its solution is the resistance of the individual municipalities to surrendering anything of their independence. This insistence on the preservation of their identity, sometimes based on lower tax rates or supposedly "cleaner" politics, is generally short-sighted.

Early Forms of Municipal Government.—The basic form of municipal government came from England. Its central feature was a city

council composed of two grades of members—aldermen (usually magistrates) and common councilmen—who sat together and had equal voice in the council's deliberations. Members were generally elected by some form of limited suffrage, although in Philadelphia the council was self-perpetuating. The council as a rule chose one of its number to be mayor, who presided over its sessions and exercised important judicial powers as chief magistrate. There was often also a recorder whose functions were primarily judicial, and a clerk. All these officials, except the clerk who was a busy functionary, served ordinarily without compensation.

This simple form of government worked very well for the small cities of colonial and post-Revolutionary times. The principal function of these municipalities was the formulation of police regulations for the maintenance of peace and good order, and the administration of justice. Most of the municipal services to which we are now accustomed were nonexistent. Police protection was handled by elected constables supplemented by a night watch on which citizens served compulsorily in rotation. Fire protection was a matter of supplying leather buckets or a portable hand pump for the use of volunteer firemen. Water came chiefly from wells, and such sewers as existed were for the drainage of low places. Only a few of the principal streets were paved, and those with pebbles, and, sloping toward the channel in the center, had neither sidewalks, curbs, nor gutters. Refuse was generally piled in the poorer streets, and only occasionally carted away. Public health administration was limited to enforcing a quarantine on the victims of small-pox and yellow fever. Street lighting was by lanterns which householders were obliged to hang beside their doors. Down to the first quarter of the 19th century there was nothing which a city government did, except for the occasional services of a surveyor or physician, which could not be done by any reasonably intelligent and passably educated citizen. The population was small and homogeneous, the problems—judged by modern standards—insignificant.

Growth of Machine Rule.—With the second quarter of the 19th century a series of forces arose which transformed municipal government into what James Bryce, writing in 1888, called our "one conspicuous failure." The first of these was a very rapid growth in city population, swelled by a rising flood of foreign immigration. Another was the widespread adoption of universal suffrage. The greatly enlarged electorate, poorly schooled in the ways of democracy, was torn by bitter national issues which put a premium on party discipline and disposed even good citizens to tolerate the misdeeds of a local machine which contributed to party victory on the national stage. The progress of science and invention created new wants and the means of satisfying them, necessitating the multiplication of municipal functions. There were thus opened up opportunities for the venal politician on a vast scale. The unhappy results were aggravated by the political philosophy of the time. In pursuit of the "separation of powers" and "check and balance" theories which played so strong a part in determining the form of our state and national governments, city councils came frequently to have two chambers; the mayor became a separately elected officer with power of veto but, like the state governors, sharing execu-

tive authority with a number of elected officials, and the mayor's appointments had to be confirmed by at least the upper house of the city council; and finally, the doctrine of "to the victor belong the spoils" prevented the formation of a respectable municipal civil service. Council committees still played an active part in administration. For the ostensible motive of removing certain departments like police, fire, and public works from political control, they were put under the control of boards appointed for long and overlapping terms, sometimes by some state authority.

There was thus produced more than a half century of bad municipal government, dominated for the most part by political machines, frequently corrupt and inefficient. This era was climaxed by the scandals which surrounded the Tweed Ring in New York and the Gas Ring in Philadelphia, but there were scores of others whose intentions were equally bad though they lacked access to the treasure chests of such great cities.

It is difficult for the present generation to realize what great progress has been made since Lord Bryce passed his sentence on our city government. In 1888 there was no such thing as a merit system of appointment in any city outside the states of New York and Massachusetts. There was scarcely a sound law in the United States governing the registration of voters. The first "Australian" ballot acts were adopted in 1888 in Massachusetts, and in Kentucky for the city of Louisville. Although municipal government had become a large and complicated business, it was still administered on the theory that any intelligent citizen could fill any job in its service, which—interpreted—meant that any citizen capable of service to the machine was qualified for a city appointment.

Since 1888 these and many other things have changed. It is impossible here to trace in detail the progress of municipal government since that time. It is enough to say that around the turn of the century numerous forces became active which have resulted not in the perfection of municipal government but in making it compare favorably with the government of foreign cities and with federal and state government at home. Unlike some European countries, our improved municipal government has not been imposed from above. It has been in large part the result of increased citizen interest, and the creation of a great number of citizen organizations. The proceedings of the first National Conference for Good City Government held in Philadelphia in 1894 described the organization and methods of the 46 municipal reform organizations known to exist at that time. At this meeting the National Municipal League was organized, which has functioned ever since as the country's clearing house for improvement in municipal government. Since then there has been in most cities of over 100,000, one or more citizen organizations for good government. There has also been a tremendous increase in the literature devoted to municipal problems. A complete *Bibliography of Municipal Administration* was published in 1897 as the first quarterly number of a short-lived periodical, *Municipal Affairs*. Today it is necessary, anywhere that municipal government is seriously studied, in universities, city halls or research agencies, to maintain a special library to make available the flood of printed material. Univer-

sity and college courses in municipal government and administration are numbered in the hundreds, while several universities carry on graduate courses for the training of would-be municipal administrators. Municipal government has been under the spotlight of intelligent public interest sufficiently to have brought about many advantageous changes in its organization and procedures. At the same time, grim necessity has taught even the politicians the futility of trying to run a modern city with men untrained except in the arts of politics. Building streets, laying sewers, preventing crime, fighting fire, controlling disease, feeding and clothing the needy, housing the underprivileged, or providing recreation, are no longer tasks for the intelligent amateur or the political henchman. The consequences of bad administration are so serious that even machine politicians do not dare run the risks that attend a clean sweep of trained personnel after an election. The practice of merit appointment and good-behavior tenure has been spread by law, and also by tacit acquiescence of the political magnates.

Classes of Municipal Organization.—There are three distinct types of municipal organization in the United States: independent executive, commission, and manager.

Independent Executive.—The independent executive, or mayor and council type, represents the perpetuation of the fundamental principle of our federal and state governments. Before 1901 it was the almost universal form of municipal government except for small boroughs or villages in certain states where the mayor, chief Burgess, or warden, was little more than the presiding officer of the governing body. It still is found in about two thirds of the cities of over 5,000 inhabitants, and in all cities of over 500,000 except Washington, D. C., which is governed by Congress through a commission of three members appointed by the president. Its essential feature is a mayor elected by the people independently of the city council. There is an infinite variety in the details of municipal governments of this sort, but they fall roughly into two main types, based on whether the mayor has little or much actual authority. The first or "weak mayor" type is by far the more common. It is characteristic of this type that there are other important city officials such as comptroller or auditor, clerk, treasurer, attorney, assessor or board of assessors, street commissioner, and safety commissioner, also elected by the people. The mayor's appointments are subject to confirmation by the council and some departments are presided over by boards appointed for overlapping terms longer than that of the mayor, so that a good deal of his term goes by before his appointees are in a majority on the board. The mayor sometimes has a veto over acts of the council and sometimes is its presiding officer. Where he has either or both of these privileges his influence is increased, but not sufficiently to counteract his lack of direct control of the administrative side of the city's business. In this type of city government the council, even though preparation of the budget is left to the mayor (which is not always the case), has ultimate authority in making appropriations. This control of the purse is vital. The center of gravity in the weak-mayor type is usually in the council or in some machine or boss outside the formal city government.

The second or "strong mayor" type is found

chiefly in the larger cities. It is characteristic of this type that the mayor should have power of appointment and removal of all persons outside the classified civil service without council interference; that his appointees should include the heads of all principal departments, and that these heads should be boards only in the case of the library, parks, and schools; that the mayor should submit the budget and supplementary appropriations, and the council be limited to reducing or eliminating items proposed by the mayor; that he should have a veto over the acts of the council, requiring at least a two-thirds majority to overcome. The extreme example of the strong-mayor form of government is to be found in Boston where the mayor is for his four-year term (he cannot succeed himself) practically dictator of the city's affairs. New York properly belongs in the same class, in spite of the modicum of administrative powers assigned to the presidents of its five boroughs.

The council in 16 mayor-and-council cities, all in New England except New York City and Richmond, Va., and all of the weak-mayor type, except New York, still consists of two houses. The size of the council varies in mayor-and-council cities from 50 in Chicago to as few as 2 or 3 in a few small places. The median number is 19 for cities over 500,000, but only 7 for all cities over 5,000. The 2-year term is most common for both mayors and councilmen, but a 4-year term is in effect in more than a third of the mayor-council cities. They are about equally divided between council election at-large and by wards, with a considerable number having a combination of the two methods.¹

Commission Type.—The most simple form of control of any organization—industrial, commercial, social or political—is a committee of its members. It is not surprising, therefore, that, at various crises in the affairs of cities, resort was had to government by committee or commission. One striking example of this sort occurred in 1874 when, as a supposedly temporary expedient, executive power in the District of Columbia was entrusted to a commission of three appointed by the president, Congress retaining legislative power in its own hands, an arrangement which has become permanent. In 1879 the management of bankrupt Memphis, Tenn., was handed over to a board of 3 fire and police commissioners, supplemented, in the award of contracts, by a board of public works of 5 members. It was, however, the experience of Galveston, Texas, following the disastrous flood of 1900, which actually launched commission government as a normal means of municipal administration. Following the terrible destruction caused by the storm, the old system of government, consisting of a mayor and 12 aldermen elected at large, completely collapsed. In this emergency a body of business men who had been working on plans for harbor development, known as the Deep Water Committee, took over the command. Casting about for an efficient basis for a new, legally constituted government, they hit upon the idea of a commission of five appointed by the governor. In the 1901 legislature the measure was altered to permit the people to elect two of the commis-

¹Complete details of this sort for all cities of over 5,000 population are to be found in the *Municipal Year Book*, published annually by the International City Managers Association.

sioners. Happily, as it turned out, the Court of Criminal Appeals found the appointment of the remaining three commissioners by the governor unconstitutional, so that in 1903 all five members of the commission became elective. So desperate was the situation of Galveston and so ably did the commission handle its affairs, that the dramatic story was repeated throughout the country and the way prepared for widespread imitation of the "Galveston experiment."

The most original feature of commission government was that while complete municipal powers were vested in the commission as the governing body of the city, each of its members was the working head of one of the five city departments. The reasons for its success, however, were to be found in its compactness, its avoidance of the speech making and exhibitionism of large deliberative bodies, the absence of "checks and balances," and the consequent clear-cut responsibility of its five members to their fellow citizens. Great impetus was given to the spread of commission government by the optional law for first-class cities passed by the Iowa legislature in 1907 and adopted that year by Des Moines and Cedar Rapids. This Iowa act—widely publicized as the "Des Moines Plan"—added to the commission plan the initiative, referendum and recall. Henceforth these features went along with commission government and had a great deal to do with reconciling the people of many cities to the unaccustomed concentration of power in the hands of a body of five men. The Des Moines Plan also embodied the idea of non-partisanship in municipal affairs which has since been very widely accepted.

The spread of commission government was extremely rapid from 1909 to 1913 when it began to lag, although several of the larger cities adopted it after that date. It has since steadily lost ground, mostly to its younger competitor, the manager plan. It may now be found in about 325 cities of over 5,000 population. None of them are over 500,000. The largest cities with this form of government are New Orleans, Newark, N. J., Portland, Oreg., Jersey City, Memphis, St. Paul, Birmingham, and San Antonio.

The fact that the commission form of government has been on the retreat for many years is due chiefly to the serious defects which it developed in practice. It has never been conspicuously successful except in places of moderate size like Galveston and Des Moines. Its most serious weakness is that it confuses the functions of representation and administration. For the selection of representatives, popular election is essential. The qualities which make a good administrator are not usually the qualities which make for political success. In the commission plan the same persons who as a group determine the city's policies are individually responsible for their execution. There is a continuance of amateur direction of administration not in conformity with the needs of modern cities. There is a certain artificiality, also, in dividing city administration into five compartments, which brings unlike services together under one head. The usual method of electing commissioners simply as commissioners, and then assigning them to their respective posts, results too often in having two or three men adapted to one post and no one suited to another. Election to specific commissionerships does not improve the situation as the public is

not discriminating in its choice of commissioners of finance, as distinguished from those of public works. Experience has clearly demonstrated that the heads of administrative departments should be appointed, not elected.

Manager Plan.—The manager plan was, in the historical sense, a development from the commission plan. Given a small commission, or council, in which all the powers of the municipality are concentrated, as in the board of directors of a corporation, it was natural that someone should suggest going one step further, by appointing a general manager to carry out the decisions of the council. That is the essence of the manager plan. The council appoints and removes the manager at its pleasure. The council determines what is to be done—often at the suggestion of the manager—and the manager sees to the doing. It thus squarely meets the chief defect of the commission plan. The council represents the people in determining municipal policy. The manager is the agent in the administration of that policy. He appoints and removes, subject to the personnel provisions of the charter, the heads of departments and frequently many, if not all, of the employees of the city.

The first American city to install a manager was Staunton, Va., in 1908. The Staunton managership was an accidental development, here applied by ordinance on top of a mayor and two-chamber council, then prescribed for first class cities in Virginia. Wide publicity was given to the National Short Ballot Organization to the unsuccessful attempt of the Board of Trade of Lockport, N. Y., to get from the 1911 New York legislature an improved form of commission government featuring a city manager. In 1912 Sumter, S. C., received the first actual manager-plan charter.

The turning point for the manager plan came in 1913 when Dayton, Ohio, taking advantage of the home-rule amendment to the Ohio constitution adopted the year before, wrote itself a manager-plan charter. This charter was brief and well drafted, and contained not only such devices for popular control as the initiative, referendum, recall, and nonpartisan elections, but modern budgetary, financial, and civil service provisions. The flood of May 1913 had put Dayton in the limelight. The first council under the charter drew further favorable attention by seeking to employ as manager George W. Goethals, famed builder of the Panama Canal. Though this effort failed, the man selected—Henry M. Waite—proved an ideal manager. Finally, John H. Patterson, president of the National Cash Register Company and chairman of the commission which had drawn the charter, for many years made the success of the Dayton experiment a leading feature of his company's nation-wide publicity. It is no wonder therefore that the Dayton charter was quickly imitated throughout the country. Every year since 1913 has seen a steady increase in the number of manager-plan municipalities. There were on Dec. 31, 1946, according to the National Municipal League, 725 American cities in which the manager plan was in force, while in addition, Hartford, Conn., had voted to adopt the plan and was merely awaiting legislative approval before putting it into effect. At the time this article was written (1946), only 28 cities had abandoned the manager plan. Although the manager plan is in effect in no city of more than

00,000, it is well represented in all other population groups and, contrary to the popular assumption, is in force in a larger proportion of cities from 50,000 to 500,000 than in smaller places, the figures being 28.8 and 16.8 per cent respectively. More than 80 cities adopted the manager plan in 1946, exceeding all previous records.

The manager plan is no novelty in the field of public administration. Our public school systems are administered by boards of education and superintendents who bear essentially the same relation to one another as city council and city manager. Our public institutions are controlled by boards of trustees who act through a superintendent, president, or other executive. Taking into account private corporations, which are our greatest contribution to the science of management as such, the manager principle is the most common and most successful principle of organization developed in America. It has succeeded in the field of municipal government, as attested by its steady and uninterrupted growth for a generation.

There are some concomitant features of the manager plan which need description. All but a very few manager-plan cities continue to have a mayor who presides over the council and acts as ceremonial head of the city. This further emphasizes the position of the manager as the council's business agent. In the majority of cases the mayor is elected by the council from its own number. In something over a third of the cities of over 5,000 population, he is elected directly by the people, and, in a very few instances, he is the candidate for council receiving the highest vote. In only a handful of manager-plan municipalities does the mayor have a veto. The number of councilmen ranges from 2 to 20, but the most frequent number is 9 in cities of over 100,000, and 5 in other places. It is not unusual to find alongside the council and manager one or more officials elected directly by the people—such as a comptroller or board of assessors. Frequently the council appoints other officers besides the manager, such as the city clerk, city attorney, comptroller, planning commission, or library board. Such elective or council-appointed officials tend to weaken the position of the manager, but as long as he can appoint and remove the heads of the principal money-spending departments such as police, fire, public works, and of any utilities the city may own or operate, the manager plan may still function successfully.

Methods of Election.—Nothing has had a greater influence on the betterment of municipal government than improved election procedure. Good permanent registration systems which make it easy for the bona fide voter to remain on the list without opening the door to the fraudulent voter, good ballot laws, and voting machines which assure an honest count, have been vital on the municipal as well as other levels of government. There are two election devices which were local in their origin, which have done much for better municipal government.

Nonpartisan Majority Elections.—The first device, nonpartisan majority elections, gained wide prominence in the Des Moines Plan of 1907. Under this plan a candidate can be nominated by a small petition—25 signatures is the common requirement. The candidates so nominated compete at a first or elimination election, and the two for each office receiving the highest number of

votes become the candidates at the final election. At neither the first nor final election does any party designation appear on the ballot. This put a stop to the old trick of the machine, where a mere plurality of votes was required, of running dummy candidates to split the vote of its opponents. A variation on the same theme first appeared in this country in the Dallas charter of 1907 (slightly antedating the Iowa act). A candidate receiving a clear majority of the votes cast in the first election is thereby elected and the final election is concerned only with those offices for which no one had a majority in the first election. In one or the other of these two forms, nonpartisan elections are now the rule in more than half of all municipalities of over 5,000 population.

Similar results have been accomplished without a double election in a very few instances by the use of one or the other of the several forms of preferential voting. These systems permit the voter to express his preferences among the candidates on the ballot and his second, third and other choices are given weight if his first choice is not elected. This plan, though it saves the cost of one election, has not found favor with the American public.

Proportional Representation.—The second important device developed is proportional representation by the single transferable vote plan. It is in effect in New York City and Yonkers, N.Y., Cincinnati and Toledo, Ohio, Lowell and Cambridge, Mass., and in several smaller places. This plan is intended to give representation in the city council to each group of opinion in the community in proportion to its voting strength. It does this by permitting each voter to express his preferences among the candidates by the use of figures (1, 2, 3), and determining the result by mathematical formulas.

Proportional representation is included in the model charter of the National Municipal League. An excellent brief explanation of the system can be found in George H. Hallett, Jr.'s *Proportional Representation, the Key to Democracy*, distributed by the same organization. It is advocated by many persons interested in municipal reform, not only on theoretical grounds but for the very practical reason that it gives the advantages of electing the council at large without the danger of having all its members of one party. In Cincinnati it has regularly given each of two major parties representation almost exactly proportionate to the votes it has cast. On the whole, this system has commended itself for the quality and representative character of the councils it has produced.

Personnel.—One of the greatest advances in municipal government has been the general recognition that a strong personnel agency is necessary not merely to eliminate politics from appointments, promotions, and removals, but to recruit and train efficient municipal personnel. For this purpose employees are divided into the classified and unclassified service. To the former belong all employees except heads of departments, some confidential assistants, and a few professional and other specially exempted persons. The members of the classified service are selected and promoted on the basis of competitive examinations and can be removed only on definite charges and after hearing.

In the early days of civil service reform, when the emphasis was on breaking the grip of

politics on the service, the personnel agency took the form of a civil service commission made up of prominent citizens drawn from both major political parties, who served without pay. Assisted by a paid secretary, they conducted examinations, made rules relating to their work, and heard appeals in cases of removal or other disciplinary action. These commissioners did a great work in battling with the politicians for the enforcement of civil service regulations. Persons skilled in public personnel problems now favor a personnel department under a director appointed by the mayor or manager, with a consultative board to aid in making rules and in acting on employee appeals. It is felt that the more cordial and intimate relation between the administration and the personnel agency, which this arrangement brings about, makes for a wider and more effective use of its services.

One of the most important functions of a personnel agency is the preparation of classification plans and pay plans under which employees are properly graded and paid in accordance with the nature of their duties. Each class of employment has its range of pay within which the employee advances automatically.

Pensions.—The employees of most municipalities are included in a pension plan which permits retirement after a specified length of service, on reaching a certain age, or both, or upon becoming disabled. Many of these pension plans are not supported by actuarial reserves and the employees' contributions are often so small and the conditions of retirement so easy—after 20 or 25 years of service irrespective of age, for example—that they impose tremendous burdens on the city treasury. Pensions are a proper complement to an enlightened pay schedule but the cost should not be allowed to bear an unreasonable relation to the pay roll itself.

City Planning.—The planning of the physical development of a city is essential to its ordered growth. It is necessary to have a master plan—subject to change from time to time—fixing the location of streets, transportation lines, terminals, public buildings, parks and playgrounds, and indicating the use to which each portion of the city's area should be put. It has been found desirable to have a planning commission make such plans and pass on all variations from them. The commission consists preferably of interested laymen appointed by the mayor or manager for long, overlapping terms, together with representatives of the city council and of the city executive. It is primarily a deliberative body advising, with the help of experts it employs, the city council on the matters within its jurisdiction. It has an administrative aspect when called on to approve or disapprove the plats by which real estate developers propose to subdivide their property. Usually no ordinance affecting the city plan can be passed by the council without first giving the commission an opportunity to express its opinion, and, when it disapproves, many city charters require an enhanced majority in the council to pass the ordinance. Its approval should be necessary to the adoption or amendment of a zoning ordinance.

Municipal Government and the Public Schools.—The operation of the public schools is usually considered a state function and in the United States is regulated by state law. With rare exceptions these laws have made the city school district a corporation distinct from and

often including more territory than the municipality itself. The school department, therefore, is not a department of the municipal government in the ordinary sense, but a separate branch government coordinate with the municipality. In the great majority of urban communities the schools are under the control of a board elected directly by the people. In only two cities are school and general municipal administration completely integrated. These are the commission plan cities of St. Paul, Minn., and Chattanooga, Tenn., where one of the commissioners is commissioner of education. In a number of cities—about a fifth of those of over 50,000, including New York City—the school board is appointed by the mayor, the council, or the two together. In only one city is the school board appointed to the city manager. Even in these cases the control of the municipal authorities over the schools is very limited since their operation is so minutely controlled by state law and the habit of school board independence so well established. The only important exceptions are in those cities where a single powerful political machine dominates both the school board and the municipal government.

About a third of the school districts, related to cities of 50,000 or more, fix their own tax rate and levy their own taxes. The rest have to submit their budgets to the county or city legislative body. In a majority of these cases the city or county has the legal power to reduce the total of the proposed school budget but in few cases does it include the power to revise the school budget in detail. It is only in a serious emergency that a city council will cut a school budget.

In some states, like Massachusetts, Connecticut, and New York, title to school property is vested in the city, and, in these states and some others, bonds for school buildings have to be issued by the city. This does not seem, in practice, to give the municipal authorities much additional influence over the schools. Schools, in fact, sometimes avoid compliance with the city planning ordinance and building code on the ground that they are state agencies.

Where taxes for school purposes are levied and collected by the municipality, the money is kept in the city treasury and paid out in the same manner as other city funds. This saves the keeping of an independent set of accounts by the school department. In about a quarter of the cities of over 50,000 population, the city's personnel department acts for the schools in filling some or all nonteaching positions. The nonteaching staff sometimes participates in city pension systems. In cities of over 50,000 population, the city purchasing department infrequently buys school supplies and only in a few cases do the schools make use of the engineering, architectural, and building maintenance staffs which the larger cities maintain. The public undoubtedly suffers from these failures to cooperate.

Even more serious is the frequent failure to secure coordination between the municipality and the schools in such social enterprises as health recreation, and the prevention of juvenile delinquency. Some extraordinary results have been accomplished where cordial cooperation exists and the school and municipal agencies each devote itself to the part of the job for which it is best fitted, without conflict or duplication. The chief stumbling block is in the allocation of expense. Until there is coordination between

school and municipal budgets there will be little coordination in social services.

Public Libraries.—The public library is another service commonly associated with the name of a municipality, but is by no means always an activity of the city government. Several hundred public libraries, including those of New York, Baltimore, Buffalo, Springfield, Mass., and Providence, R.I., are operated by self-perpetuating boards of trustees or by associations. In Cleveland, Detroit, Indianapolis, Kansas City, and elsewhere, libraries are a school district—not a city—function. Among strictly municipal libraries only a handful, mostly in commission and manager-plan cities, are directly integrated with the city government without the interposition of a board of library trustees. The remaining libraries—about three quarters of all—are city libraries operated by boards. In Minneapolis, Grand Rapids, and many smaller municipalities, especially in New England, this board is elected by the people. In the majority of cases the board is appointed, usually for long, overlapping terms, by the mayor, a mayor and council, or, by the city manager.

A good many are given a certain degree of independence of the municipal government by a fixed tax rate guaranteed by charter or statute. Many libraries, however, are incorporated, and use their own funds which partially support them, and they are usually, and without ill effect, allowed a degree of independence, less than that of the schools, but larger than that usually accorded other departments.

Administrative Organization.—Generally speaking, except in commission-plan cities, there is always at the head of the administrative activities of the municipality a single executive, mayor or manager. The completeness of his command over the several departments and agencies varies a good deal. It even varies somewhat between the manager-plan city and another. Separately elected officers are confined mostly to the financial staff—assessor, auditor, comptroller, treasurer—plus such posts as city clerk and city attorney. No municipality of more than 50,000 population elects a city engineer, a public works director, or police chief, and of lesser places the number that do is small and decreasing. Nearly half the cities of over 5,000 population elect no department heads at all. In other words, there is a general pattern of administrative organization shaped like an inverted pyramid and resting on the mayor or manager.

There is no uniformity as to the number and scope of the several departments and other agencies, or in the form of their internal organization. We have already commented on the artificiality of the commission plan's division of administration into five parts. The same is true of the much imitated fivefold division into departments set up in the Dayton charter—finance, law, safety, welfare, and service. In most other cities the division of administration into departments has grown up without much regard to symmetry or order.

While the division into departments varies so much from city to city as to defy brief description, there are certain functions and activities which appear in very similar form in almost all cities though arranged in different departmental groupings. They may be divided into staff and line functions. Under the first head may be grouped those internal activities which are essential to the operation of the municipal govern-

ment but which do not directly serve the public. Under the second are gathered the service activities to render which the municipal government exists.

Staff Functions.—Among the staff functions are:

(1) Assessment of property for taxation and tax collection—entrusted to an assessor or board of assessors and a tax collector frequently elected by the people, but in modern charters often subordinates of the finance director in an integrated department of finance.

(2) Accounting and budgetary control—usually the duty of the chief financial officer—comptroller, auditor, or treasurer—frequently elective. Appointment, however, by the chief executive of a finance director, with power to pre-audit all proposed expenditures as well as supervise all other financial activities, is a growing practice.

(3) Custody and disbursement of funds—the duty of the treasurer, the most frequently elected of all administrative officers.

(4) Selection, training, and management of personnel—under a civil service commission or a department of personnel headed by a director.

(5) City Planning—under the planning commission.

(6) Legal advice and representation—the duty of the city attorney or corporation counsel.

Line Functions.—The principal line functions are:

(1) Protection from crime and disorder—primarily the work of the police either as a separate department or as part of a department of safety.

(2) Protection against fire—carried on by the fire force which may be a department by itself or a division in a department of safety.

(3) Inspectional services—building, plumbing, electrical, elevator, and weights and measures inspection, frequently uncoordinated but sometimes united as a division in a department of safety.

(4) Traffic safety—the planning and engineering side of that problem may be assigned to any one of various departments.

(5) Protection against disease—the field of the department of health, sometimes grouped with welfare, and even recreation, but properly a separate service.

(6) Protection against the consequences of poverty—usually handled by a department of welfare which covers the charitable activities of the city.

(7) The provision of low-cost housing—under federal policies left to a quasi-public corporation known as a housing authority appointed as are other city officials but independent of the city government.

(8) Hospitals and other institutions—sometimes combined with health or welfare and sometimes set up as separate agency.

(9) Parks and recreation—in many cases united in a single department but often with a separate setup for active recreation.

(10) Design and construction of public buildings and works the function of the city engineer, sometimes the head of a department of his own, but frequently merged in a department of public works.

(11) Maintenance and cleaning of streets and sewers, the collection of refuse, and the disposal of sewage and other wastes—often the job of an integrated department of public works but sometimes handled through separate departments for streets, sewers, and collection and disposal of refuse.

(12) Utility services—undertaken directly by the municipality as to three quarters of all water plants, one third of all electric generating plants (not including numerous distribution systems for which the city buys current), and a handful of gas plants and transportation systems. The last includes the subway system of New York and the street railway systems of some cities such as Detroit, Cleveland, San Francisco, and Seattle. Municipal utilities are sometimes operated through the public works department but more frequently have their own setup.

THOMAS H. REED,

Municipal Consultant, Wethersfield, Conn.

MUNICIPAL HOME RULE. Municipal corporations, in the United States, have no implied right of home rule, no inherent privilege of enjoying untrammelled local self-government. Formerly, considerable rhetoric was expended in attempts to show there was such an inherent right of self-government in local communities, and some courts in a few of the states still assert that it exists. But, the United States Supreme

Court and most state jurisdictions have declared categorically and established that home rule for local subdivisions is not indigenous to them and that it prevails only to the extent, if at all, vouchsafed to them by the state, of which such local subdivision is an arm.

Another postulate to be kept in mind is that all municipal corporations, including, in the broad sense in which the term "municipal corporations" is often used, not merely cities, towns and villages, but counties, school, water, road and utility districts, or so-called authorities, are creatures of the state, called into existence through state enactments for carrying on in various localities the government or some part of the government of the state. Thus, being created as agencies of the state, they exist at the will of their creator. The state may, therefore, incorporate territory and annex it to other territory or dis sever it therefrom, dissolve the municipal corporation, restrict its powers or cancel some of those granted, all without consent of the local inhabitants concerned, or, indeed, against their wishes. The local subdivision has no rights under the federal Constitution which enable it to protest successfully against any such action on the part of the state.

A third thesis is, municipal corporations, not enjoying a grant of home rule, have only such powers as are expressly granted and such as are necessarily implied from the powers specifically granted. In this respect, cities (in the broad sense) differ from private corporations which possess all implied powers that are reasonably incident to or convenient in connection with exercise of powers expressly conferred by the legislature. Moreover, the rule of interpretation of municipal powers, varying from that relating to private corporations, calls for strict construction, so that a fair doubt by the court of the existence of a municipal power means it does not exist.

An added obstacle for nonhome rule cities seeking to obtain permissive legislation for legitimate needs is that many state constitutions have provisions that forbid passage of special acts conferring corporate powers (e.g., Section 1, Article XIII, Ohio Constitution) and which require that all laws of a general nature shall have a uniform operation throughout the state (Section 26, Article II, *id.*). Such constitutional provisions have been interpreted as applying to municipal as well as to private corporations. Often, the clumsy expedient of classification to circumvent the rigidity resulting from such provisions has been attempted by the state legislative body; but when legislative classification becomes so overelaborate as obviously to be a subterfuge and to apply plainly to one or two cities only of the state, the door of this attempted escape from constitutional confinement is bolted by invalidation through court decision. The result is that much overall Procrustean legislation, purporting to fit the needs of large cities and small towns alike, has been enacted. The injustice and crippling effect of such straight-jacket legislation is apparent.

As the population of this country, at first rural, became largely urban, sound development of the cities was retarded by their dependence on grants of power from state legislatures. This situation would have been bad enough in any event, but, in many states, the general assemblies have always been predominantly rural and

the legislators have had a suspicion or jealousy of the cities and reluctance to grant them power necessary for their proper functioning and development. Hence, we have had great metropolises like New York, Chicago or Philadelphia cities, any of which may have as many inhabitants and more property than some states, appear as suppliants for grants of power from a rural general assembly possessing no idea of urban needs, aspirations or possibilities of accomplishment. At the same time, there has been insistence that cities shall assume many new functions. Some of the failure of the cities to obtain from the state legislature needed grants of power was doubtless due to the fault of the city representatives for whom the rural legislators had no respect, knowing them to be boss controlled, of inferior caliber and "city slickers." Some legislatures did grant to cities the choice, by vote of the local electors, of certain optional forms of city government, and such local option laws were upheld by the courts as constitutional against attack for asserted forbidden delegation of legislative power. But grants of home rule by statute, even to the limited extent obtained, are held by insecure tenure; since, the same almoner that confers the boon can always modify it capriciously or withdraw it in part or entirely.

Benefits of Home Rule.—Aside from the great advantage of independence which home rule confers on cities, there are other benefits which result. First, there is opportunity for self government, initiative, experiment and civic pride and education. A city enjoying home rule may use methods of operation and election of its officers which are different from those prescribed by state law for state and county officials. Thus the state law may call for a party column ballot with one cross mark as a sufficient vote for all offices under a party emblem convenient for the ignorant and illiterate. Under home rule, a city may utilize voting under proportional representation in elections, which requires ability to read, and this qualification may be required despite the fact that there may be in the state constitution a provision to the effect that no elector shall be deprived of the right to vote for all elected officials. A state constitution may require that all officers shall be electors when chosen. Yet, a city may adopt a council-manager charter providing that the city manager need not, when chosen, be a resident of the state. Formerly, the Ohio Supreme Court held that the constitutional provision of requiring elections by "ballot" forbade the use of voting machines. But it also held that a city, under its home rule charter, could use such machines in city elections; also, that it could enfranchise women for voting in city elections at a time when benighted constitutions limited the suffrage to males.

Second, the grant of home rule avoids much loss of time of municipal officers and much expense to the cities when seeking, at the capital, needed special legislation in the guise of general laws.

Third, the local government is set up with the approval of the persons concerned and over whom the government is to operate. They, therefore, acquiesce more readily in its functioning under methods of their own choice than if the pattern of government is imposed on them by remote control.

Fourth, the ability to divorce municipal from state and national issues is of first importance.

The separation makes for independent thinking on municipal policies and permits selection of local officials on the basis of merit rather than the irrelevant test of national party affiliation.

Likewise, it is a relief for the legislature, too, and a saving of its time to be rid of the burden and sometimes corrupting influence of demands of municipal lobbies for special legislation.

State Grants to Cities and Counties.—Despite all these advantages, the movement to obtain constitutional grant of home rule was slow in getting under way and its spread has not been rapid and general. Missouri in 1875 was the pioneer, then came California (1879), Washington (1889), Minnesota (1896), Colorado (1902), Oregon (1906), Oklahoma and Michigan (1908), Ohio, Arizona, Texas and Nebraska (1912), New York (1923), Wisconsin (1925). In Pennsylvania (1922) cities were given the right and power to adopt charters, but the provision was too weak to be of substantial benefit. Maryland, Wisconsin, Nevada and West Virginia also have some degree of home rule for cities. Ohio (1932), Virginia and a very few other states have constitutional provisions also for obtaining home rule for counties. But by interpretation of the Ohio Supreme Court, the Ohio provision has been so restricted as to be of little practical utility.

Various patterns of constitutional home rule have been adopted. The phrasing may be something like this:

"Each city is granted full power to pass laws and ordinances relating to its local affairs, property and government; and no enumeration of powers in the constitution shall be deemed to limit or restrict the general grant of authority conferred; but such grant of authority shall not be deemed to limit or restrict the power of the legislature to enact laws of state-wide concern uniformly applicable to every city."

Another usual form is contained in Article XVIII of the Ohio Constitution, part of which is as follows:

"Sec. 3. Municipalities shall have authority to exercise all powers of local self-government and to adopt and enforce within their limits such local police, sanitary and other similar regulations as are not in conflict with general laws."

"Sec. 7. Any municipality may frame and adopt or amend a charter for its government and may, subject to the provisions of section 3 of this article, exercise thereunder all powers of local self-government."

Or the terminology may be that: "Cities may pass ordinances relating to matters of local or municipal concern or relating to municipal or local affairs."

Such expressions are not crystal clear. They require court hermeneutics and, therefore, it eventuates that the measure of home rule the local community enjoys, even in states where it by-passes the legislature and springs directly from the constitution, is what the courts say it shall be; so that the extent of home rule, where it has been accorded by the constitution is not so much a legislative as a judicial question, particularly as in many states the constitutional grant of home rule is self-executing, coming from the people to the people directly through the medium of their constitution and not requiring legislation to put it into effect. Where the constitutional provision is thus self-executing, such direct grant of home rule is a great advantage. This becomes evident when compari-

son is made with constitutional grants requiring or permitting the legislature to put them into effect, such as, for example, the merit system provision in the Ohio Constitution, Sec. 10, Article XV, which includes: "Laws shall be passed providing for the enforcement of this provision." Some of the laws that have been passed and sanctioned by the Supreme Court have not furthered but have severely crippled enforcement of the merit system in that state.

Total absolute home rule is nonexistent even in constitutional home rule states. Matters of state-wide concern are still reserved for state, not local control. When Cincinnati undertook to place all of its municipal court attachés under the merit system and to fix their salaries in conformity with compensation of similar employees in the city service, and Akron tried to do something of the same sort and to place its legal officers also under the merit system in its home rule charter, their efforts were thwarted by court decisions invoking supposedly conflicting state statutes. No completely satisfactory test has been established for determination whether the action in question comes under state or local legislative jurisdiction. But police measures and such subjects as criminal punishment, regulations affecting the courts, taxes and revenues, education, sanitation and health, utilities, boundary limits and others thought to be of state-wide importance are usually decided to be within the jurisdiction of the state legislative body for action by it. Ohio's constitutional Home Rule Magna Charta, Article XVIII, contains the following restrictive provision:

"Sec. 13. Laws may be passed to limit the power of municipalities to levy taxes and incur debts for local purposes, and may require reports from municipalities as to their financial condition and transactions, in such form as may be provided by law, and may provide for the examination of the vouchers, books, and accounts of all municipal authorities, or of public undertakings conducted by such authorities."

But, in certain fields, cities do have absolute home rule and in such areas may adopt municipal regulations inconsistent with and superseding state laws. A general provision in a number of home rule city charters is that state laws, present or future, shall have the effect of ordinances only and shall be considered repealed by conflicting ordinances. Even in matters of state concern, the cities may legislate if and so long as the state has not preempted the field by legislation. But, if the state legislates on matters of state concern (police, sanitary and other similar regulations, *supra*) where the state is supreme, its enactments will govern and nullify city ordinances or regulations in conflict therewith. In a famous New York case, the subject of a multiple dwelling law for New York City relating to tenements was said to be a matter of state concern, as relating to health.

The state statute does not invalidate a municipal enactment relating to the same matter, however, unless there is a conflict between the city ordinances and the state law. Thus, a mere difference in penalty between ordinance and statute defining an offense is said not to be such conflict as invalidates the ordinance. But, if a municipal enactment seeks to make lawful that which is unlawful by state law or aims to make unlawful what is declared by state law to be lawful, the resulting conflict is fatal to the city's pronouncement. Thus, for example, when a state fixes a permissible rate of speed for motor ve-

hicles, a city may not prescribe that a lower rate of speed, within its limits, is illegal; or, if the state prescribes that liquor may be sold at all hours, a city may not provide that sale within its boundaries after, say, midnight, shall be punishable.

From the above, it will be apparent that a city possessing home rule powers operates at a great advantage over cities which do not enjoy home rule. In the latter, the municipality has no powers beyond such as are granted by the state legislature or necessarily implied. In the former, the city is supreme in certain fields; and, even in others where the state retains jurisdiction, it is still supreme as long as there is no conflict to a material degree with state enactments. There is no conflict where the state has not acted in a field reserved to it, and there is no fatal conflict in all instances between state and municipal enactments on the same subject. If the cities of this country (in the broad sense including counties, etc.), are to perform well the vital function of local self-government essential to the democratic process, they must have omnipresent and more home rule.

Former Mayor of Cincinnati.

MUNICIPAL HOUSING. See TENEMENT HOUSE.

MUNICIPAL LAW. In England and America municipal law means the national law or the law of the land, both public and private, in contradistinction to external or international law. The municipal law of America is derived from that of England, which has had a continual development extending over 13 centuries. Largely influenced at times by Roman law, both civil and canon, it has retained somewhat the character of the Teutonic system in which it had its origin. By English colonists it reached all quarters of the earth and in the modern world it is the great rival of Roman law. For the first five centuries after Christ Britain was ruled by Roman imperial law after which it was banished by the invading hordes from the coast of the North Sea. With these came their tribal customs, which we find formulated in the "dooms" promulgated by the English kings from the 7th to the 11th century and by the Danish ruler of England, Canute. These laws, more properly "folk-laws," are largely made up of provisions for punishing breaches of the peace and setting fines as penalties for private wrongs. In the 8th and 9th centuries many of the Roman Church laws were introduced, especially the laws of marriage, deeds and wills, but even these were largely modified to conform to local usages and custom.

With William the Conqueror the law of the Franks, also Teutonic in origin, but highly developed in Normandy, was introduced to Saxon

England. The two systems were now in practice—the Anglo-Saxon for the English and the Norman for the conquerors—while special enactments after the Norman spirit governed the interrelations of the two races. The two systems were gradually merged with the Norman law taking precedence because of its technical superiority. Down to the days of the Tudors the language of the laws was Norman-French. The common law was developed partly by legislation (royal charters, provisions, assizes, statutes), but mainly by judicial decisions. Ecclesiastical law still exerted considerable influence having received independent jurisdiction from the conqueror. This jurisdiction churchmen sought to extend, but were checked by several statutes. In family law, however, they remained supreme as also in the administration of estates, and from the canon law are mainly derived these branches of modern English law. Judicial law-making sprang up toward the close of the Middle Ages, some judges boldly overriding the common law by virtue of the power they believed as inherent in the crown. Since the 18th century, both in England and America the courts have practically confined themselves to administering the law as established by previous decisions. On the continent of Europe the term municipal law has been often employed to designate a local law, as of a city or province, in contrast to the national body of law at present the term usually designates a civil law in contrast to the national law. In the United States within recent decades a great body of legislation concerning cities has grown up, and the term municipal law has come to be the usual designation of such legislation. See EQUITY; COMMON LAW; CANON LAW; MUNICIPALITY; CITIES, GOVERNMENT OF.

MUNICIPAL OWNERSHIP. In a broad sense municipal ownership includes all properties owned by a municipality: land, street, parks, buildings, other structures and equipment used for public purposes. However, as used here in the narrow sense, it will pertain to utility properties which are operated to furnish essential or important services to all or most of the people in the community, and which for that purpose require special use of the streets and other public places.

While utilities are commonly organized in the United States as private enterprises, they are recognized as performing public function and as such are often provided by a municipal or other political subdivision. This applies principally to water supply, electricity, gas, and urban mass transportation; but it extends also to sewage systems, waste disposal, drainage and other services found necessary or advantageous in modern community life. Other recognized utilities, such as railroads, telephones and telegraph, have seldom, or not at all, come within the range of municipal organization, due to the intercommunity and interstate ramification of properties and interconnection of service.

The term municipal ownership usually includes operation. However, utility plants may be municipally financed and owned, but leased to private concerns for operation, as has been common in the construction of rapid transit facilities. Conversely, a city could lease plant for operation from a private company, but such instances are practically nonexistent. Ownership and op-

ation prevalently go together. Even in the case of a lease to a private company, the arrangement is likely to be superseded later by municipal operation, as with the New York City subways.

This article is concerned primarily with municipal ownership of the principal utilities in the United States, but it will present also a general summary of municipal ownership in other American nations and Europe. After surveying the relative extent of municipal and private ownership in the United States, the apparent factors and trends in the prospective developments will be considered. While dealing chiefly with cities and villages, such related areas of public ownership as specially organized utility districts and cooperatives, also state and federal supply systems, will be touched upon.

Water Supply.—There are no definite official figures on the extent of municipal ownership. Based upon a survey published in the 28 September 1939 number of the *Engineering News Record*, Mr. Harry E. Jordan, Executive Secretary of the American Water Works Association, estimates that the total United States waterworks installations at the close of 1944 amounted approximately to 12,800, of which about 3,450, or 27 per cent, are privately owned. A tabulation predicated upon data published by the 1943 *Municipal Index* (p. 151), shows 1,051 waterworks systems in United States cities of 10,000 population and over, of which 263, or 25 per cent, were private.

As to relative numbers, the country's water systems may be placed roughly 25 per cent private and 75 per cent public. However, as to population served or quantities of water supplied, the private systems appear to furnish between 10 and 15 per cent of the aggregate, while public systems supply between 85 and 90 per cent. The difference is due to the fact that the large cities preponderantly have their own systems. Among the greater cities only Indianapolis, Ind., Birmingham, Ala., New Haven, Conn., Bridgeport, Conn., Scranton, Pa., Chattanooga, Tenn., Wichita, Kans., and Peoria, Ill., are reported as having private systems; no really large city is on the list. Furthermore, some central metropolitan cities deliver water wholesale to private distributors in nearby communities. In a few important instances regional supply is furnished publicly, while a considerable part of the distribution is private. In the case of Wichita, Kans., the city owns the supply and transmission properties, but distribution is private. Considering the situation as a whole, one may justifiably place the public supply at about 90 per cent of the total.

Electric Systems.—According to the Federal Power Commission, as of 1 January 1943, among communities of 2,500 population and over, there were 3,754 receiving residential electric service, of which 2,932 were served by private systems and 822 public, or 22 per cent public. The extent of the public systems varies inversely with the size of the communities; of all communities of 250 population and over, about 3,275 are served publicly. But, among cities of 50,000 population and over, only 22 are publicly served, while only two (Los Angeles and Seattle), among cities of 500,000 and over, have public systems.

While the figures are definite for the number of municipalities served publicly, the amounts of electricity delivered to consumers through

public distribution have not been officially stated. However, the volume of public generation was reported for 1942 by the Federal Power Commission at 29,632 billion kilowatt hours, compared with total 189.2 billion, or 15.7 per cent public. While some of the publicly produced energy was delivered to private distributors, the public distributors also purchased to considerable extent from private sources. Roughly 15 per cent of total distribution appears to be public, and 85 per cent private.

Gas Properties.—Again, there are no official figures, but Brown's *Directory of American Gas Companies and Index of Prominent Manufacturers*, 1943-1944 edition, lists a total of 130 municipal gas systems. Of this number, 73 furnish natural gas, 37 manufactured, 15 butane, and 5 not definitely classified. As with electricity, the bulk of the gas industry is private, probably 90 per cent, and only 10 per cent public. Differing from electricity, relatively a greater proportion of large cities have their own systems. There are four among cities of 300,000 to 400,000 population, three between 200,000 and 300,000, two between 100,000 and 200,000, and three between 50,000 and 100,000. The largest four cities are respectively, Indianapolis, Ind., Houston, Texas, San Antonio, Texas, and Memphis, Tenn.

The distinction between supplying natural and manufactured gas is significant. Of the systems in the nine cities of 100,000 population and over, five supply natural gas and four manufactured. Expansion in the industry has centered in the natural gas. This has been due to relatively low price and economical utilization for industrial purposes and residential heating. In contrast, manufactured gas has remained comparatively much more costly, and has come extensively in competition with electricity, especially for domestic uses. It has been distinctly a static or regressive business, and this fact has checked the advancement of municipal ownership. Natural gas has not only furnished an expanding demand, but its mode of supply fits well the conditions of public organization. It is provided chiefly by large interstate transmission companies which usually sell wholesale to local distributing units. A city can thus purchase wholesale and limit itself to distribution.

Mass Transportation.—Nor are there official figures for urban mass transportation. According to the *Municipal Year Book*, published by the International City Managers' Association, there were 34 municipally owned systems at the beginning of 1944. This number includes subway and elevated lines, street railways, trolley coach and gas bus systems. Within the total there are four rapid transit, seven street railways, three trolley coach and thirty gas bus properties, but in most instances the street railways and trolley buses are operated along with the gas bus systems. Three of the rapid transit properties were leased to private operators; only in New York were the rapid transit lines also publicly operated along with street railways and both kinds of buses.

This summary shows that urban mass transportation is provided predominantly under private ownership. However, the public systems appear relatively more in the metropolitan cities as compared with electricity and gas. Thus New York is served almost altogether by the city system. The same is true of Detroit, Cleve-

land, San Francisco and Seattle. Besides, Chicago, Philadelphia, Boston, Newark, N.J., and Rochester, N.Y., own the subway systems, but have leased them for private operation. As a rough estimate, the municipal systems probably serve about 10 per cent of the total urban mass transportation passengers.

Division of Utilities Between Public and Private Ownership.—The above survey shows that water supply is furnished principally through municipal ownership, while electricity, gas and transportation are provided chiefly through private agencies. The difference is due to the character of the industries and the circumstances of their development. First, an adequate and safe water supply is an absolute essential for individual and community life, which has not been true of the other main utilities. Second, water was obtained originally from wells or other individual sources, and the need or advantage of a joint community supply appeared only gradually. The early developments of community water supply systems seldom offered alluring opportunities for profits, and consequently were generally undertaken publicly. When once thus established, they usually continued, and they tended to fix the pattern for all municipal areas. Where private systems were established, there has been considerable public displacement as more extensive and distant regional sources of supply, beyond the reach of the private companies, had to be obtained through special legislation and cooperation with neighboring communities. In important instances, the water supply systems and transmission mains have been provided publicly, while the distribution facilities remained private.

The character and, therefore, the history of the other utilities has differed materially. First, no particular means of furnishing light, heat and power, or transportation, had been an absolute essential to individual and community life. Consequently, each utility emerged as a new kind of service to compete with previously existing ones; while it furnished greater convenience and attractiveness, it had to win its way competitively, and was therefore developed extensively as a private industry. It became recognized effectively as a utility, really important to the community life, only after private organization was firmly established, especially in the larger cities.

Trends Toward Publicly Owned Electric Power.—In the case of electricity, private profitability became rapidly apparent in the large cities, but not in the smaller ones; it was often provided municipally where private capital would not venture. Subsequently, however, the original public plants were absorbed by the private systems as these, during the 1920's, spread their transmission networks over large, contiguous areas. Usually the small cities were able to sell their properties at attractive prices, and the companies included them profitably in their expanding operations at the prevailing rates or at rates authorized under none too strict state regulation. This movement, however, has come practically to a stop, and in some states has been reversed, as in the Tennessee Valley area, the Pacific Northwest, and in states where public districts have become established. There have been increasing challenges to the efficacy of the private systems, due mainly to the following conditions.

Character of the business.—The furnishing

of electricity in a community constitutes a natural monopoly and practically precludes the existence of competitive systems in the same service territory, because of physical and financial factors. As a physical matter, the use of the streets is required for the distribution lines, and more than one system is impracticable. On the financial side, the fixed plant and operating costs are so great that profitable operation is usually impossible if the total business is divided between two or more operators. Maximum economy and minimum rates are available only through monopoly organization. While there are well-known instances of two systems in the same city, one public and the other private, such duplication is generally wasteful and obstructive in the streets. But, the creation of such a monopoly naturally raises the question whether it can wisely be allowed to continue as a private concern.

Conflicts of interest.—A private system is normally managed to produce maximum profits for the controlling group, rather than to obtain minimum costs and rates for consumers. This inherent force affects not only the rates but extends to all the important phases of organization and operation. During the 1920's it led to the perpetration of the far-flung holding company systems, with their notorious over-capitalization, inefficient territorial grouping, extravagant overheads, and absentee control. Such disharmony between public and private interests can be most readily removed through establishment of public ownership.

Failure of regulation.—Because of their monopoly position, the private systems have been placed under state regulation in most of the states. However, because of nonadministrable standards and procedures imposed by past judicial action, rate regulation and other control have not been as effective as had been expected, or as needed for protection and advancement of the public interest. For the future under recent Supreme Court decisions, the state regulatory systems can be reconstructed so that rate making and other aspects of regulation can be systematically administered according to the accounts and records kept under continuous commission control. The extent of such transformation may influence materially the extension of public ownership.

Antipublic activities.—Under past conditions of regulation and conflicts of interest, the private systems injected themselves extensively into the political alignments for the purpose of getting favors in matters of public policy and action, also in the appointment or election of regulatory officials and others. They also penetrated the various quasi-public organizations and spent large sums in advertising and other publicity campaigns to promote favorable attitudes on the part of the publications and the public at large. In some notorious instances they indulged in bribery to influence political action. There is widespread public resentment against such political maneuvers.

Federal taxes.—The private systems, like ordinary business corporations, are subject to federal taxes. These were increased greatly during the Second World War, and they will probably remain high for an indefinite period after the war. In contrast, federal taxes do not apply to the publicly owned systems. Inasmuch as the payments made by the private companies

enter into the rates imposed upon the consumers, they create substantial differentials against the communities served privately and in favor of those served publicly. There is thus basic discrimination against privately served localities, which can be removed through public acquisition of the private systems.

Holding Company Act of 1935.—This federal statute requires break-up and adjustment of the holding company systems so as to leave for each remaining or reconstituted system of integrated properties a simplified corporate and capital structure. Administration rests with the Securities and Exchange Commission (q.v.). While the changes do not directly promote or favor public ownership, the disposition of the properties in any locality naturally raises the question of desirable municipal acquisition as against transfer to different private control. In a considerable number of instances municipalization has followed, and it is known to be considered by several other cities.

Competitive industrial advancement.—Electric power at low rates has become increasingly a basic factor in community industrial expansion. Localities with low rates attract industries; high rates retard industrial growth. Consideration of how adequate power can be obtained most economically at the lowest possible rates is causing many city officials and industrial leaders to study the relative advantages and disadvantages of public and private organization, and to formulate effective postwar programs accordingly. The fact is that on the average for like sized cities, the municipal system rates are substantially lower than the private.

Obstacles to Municipal Ownership.—Against the combined force of the conditions that appear to favor the extension of municipal ownership, there are important obstacles, which will be briefly summarized.

Lack of legal powers.—Municipalities can do only what they are authorized to do by the state laws. In most states they are variously restricted in establishing their own electric plants. First, they may not be permitted at all to establish their own systems, or they may be limited in the acquisition of the existing private properties, or in the mode of acquisition. Second, they may not have adequate financial resources. Usually, because of constitutional debt limits, they cannot finance the plant acquisition through general credit bonds, and they may not be authorized to issue revenue bonds. A city may thus have the general right to establish its own system, but it is stopped by the restrictions on financing. Extensive revision of the state laws is essential to permit reasonable municipalization on the basis of expected community advantages.

Inertia and lack of responsibility.—Municipal officials are usually kept more than adequately busy with the positive duties imposed by state and local laws. Naturally they are reluctant to promote new undertakings not critically pressing; usually they do not have the special understanding of what is involved in municipal ownership, and their tenure in office discourages the starting of long-range policies and programs. Furthermore, with the prevalence of state regulation, they are particularly prone to pass responsibility for reasonable rates and service to the commissions.

Bias for private business.—American middle-class groups are traditionally and emotionally

in favor of private enterprise and against government in business. The business and professional leaders, the newspapers and other publicity agencies, all have strong predilections toward private enterprise. This attitude naturally affects the position of public officials on the issue of displacing private with municipal ownership. Unless conditions become flagrant, and public pressure urgent, they are likely to favor the continuance of the private systems, assuming their greater efficiency and general superiority, without real inquiry as to advantages for the communities.

Entrenched private position.—The companies have franchises, properties and capital structures which are supported by state and local laws. Furthermore, as before stated, they have political and various connections which keep to the forefront their influence in the communities. They are constantly alert to protect and advance their position against encroachment either by more stringent regulation or by public ownership.

Public impotence.—In contrast to the constant zeal of the private systems to maintain and advance their position, there is no organization or group that presents correspondingly the cause of public ownership. Local movements are usually sponsored by public-minded individuals who have little or nothing to gain personally, and have inadequate resources to finance effective campaigns. Municipalization has been defeated repeatedly at elections, not on its community merits, but for lack of organization and financial support, compared with the private opposition that profited from the continuance of *status quo*.

On the whole, the balance of favorable and opposing forces has produced substantial advancement of public ownership. This is best illustrated by the extent of electricity generated through publicly and privately owned plants. According to the Federal Power Commission, the total electric generation amounted to 94.7 billion kilowatt hours in 1930, of which 5.0 billion were produced publicly, or 5.3 per cent. In 1942 total generation was 189.2 billion kilowatt hours, of which 29.6 billion were public, or 15.7 per cent. While this increase includes all public generation, it is indicative also of the advance in municipal generation, and especially distribution. The prospect appears to be for corresponding or more rapid rates of increases in the future.

The factors for and against the extension of public ownership in electricity apply more or less equally to gas and transportation. For gas generally, there is less community importance in the issue. For transportation, there is an additional factor that in many instances favors municipal ownership.

For over twenty-five years motor transportation has come gradually into increasing competition with the existing electric street railway systems. Before the Second World War electric railways had been abandoned altogether in many cities, and in practically all there had been substantial displacements by buses. While this development was halted by the war restrictions upon bus manufacture, after the war street railways seem likely to be replaced rapidly by bus operation, of which the basic advantages as to costs and convenience appear decisive.

However, in many cities the old street railway investment remains largely unamortized or un-

depreciated on the books of the company, and the corresponding securities remain outstanding against the dead plant. This condition naturally obstructs conversion to buses; the managements strive to continue the securities and to require the riders to support both the new bus and the abandoned street railway properties. This double burden is most readily avoided through municipal establishment of bus operation.

Coordinated Public Ownership.—In the postwar utility planning, consideration of municipal ownership by the larger cities will usually transcend the city boundaries and include the adjoining communities which, with the central cities, constitute unified industrial areas. Ordinary municipal powers usually stop at the city limits, but the real economic borders enclose the entire metropolitan region. The basic community services must practically correspond with the larger territorial grouping. District utility organization has become essential in the metropolitan sections.

In the case of water supply, the central cities commonly furnish water wholesale or retail to adjacent communities. In most instances the supply must be developed in common for the entire region, and the sources are often located beyond the metropolitan territory. Under such circumstances, outright district organization has been supplied in a considerable number of instances, in the form of a special municipal corporation for the particular function. The district may develop in common the water resources and transmit the supplies to the individual communities owning their own distribution systems, or it may own and operate all the facilities, including distribution. It may provide also the related utilities of sewage, refuse disposal and drainage, also other district services.

Such metropolitan organization is an enlarged municipal utility to correspond with the industrial area. This development has appeared chiefly with water supply and related utilities, because mostly these services had been furnished municipally. As to electricity, gas and transportation, like district needs have been met by the private systems, which generally are organized on a regional rather than municipal basis. Where these utilities have been municipalized, the central city usually furnishes service to the adjacent communities. For the future, in large population centers the district may supersede extensively the distinct municipal ownership which has prevailed in the past.

In line with such district developments, future municipal ownership, particularly of electricity, will also involve integration with other levels of public organization. For example, the Tennessee Valley Authority (q.v.), a federal agency, owns and operates the generating and transmission properties and furnishes bulk electricity for distribution to many municipalities and cooperatives. A like system is under development in the Pacific Northwest in connection with the Bonneville and Grand Coulee hydroelectric projects.

For the future, to make electricity available at minimum cost to all sections of the country, a comprehensive three-level system of public ownership appears desirable,—federal, state and local. The federal would include the hydro plants, large supplementary steam stations strategically located, and main transmission lines connecting all parts of the country and deliver-

ing main load power to the states. The latter would own and operate supplementary generating stations and the secondary transmission lines, and furnish wholesale power for distribution by municipalities, special districts and cooperatives. Municipal or district ownership would thus be an integral part of a general system of public organization.

In Other Countries.—Municipal ownership outside of the United States can be referred to only in a limited way. In Canada the situation is largely the same as in the United States. Of special interest has been the Hydro-Electric Commission of Ontario, which is a special public corporation of the Province, producing and transmitting power for distribution by the municipalities. It delivers electricity wholesale at cost, while the cities in turn distribute at cost and the rates to consumers have been famously low. In Mexico and in the Central and South American countries, public ownership has not been prominent.

In Europe, municipal ownership, together with other types of public organization, has been much more extensive than in the United States. The difference may be accounted for mainly by two historical circumstances. First, government in Europe has developed largely under the "sovereign" concept, without theoretical restrictions on what could be done; the cities have undertaken varieties of enterprises that are foreign to our traditions of proper municipal functions. Second, the cities have had much longer periods of struggle with the needs and pressures of community life. Apart from theories, they learned from protracted experience that the utility industries are best provided through municipal organization.

In contrast, large cities emerged in the United States comparatively in a short span of years, under the force of private industrial expansion, to which the utility services were incidental. Particularly in electricity and transportation, it was only after the cities were reaching maturity that we began to feel seriously the consequences of entrusting public functions to private organization under monopoly conditions. While our prevalent sentiment strongly favors private business forms, we are also realistic and, under practical pressures and conflicts, we shall doubtless make such utility adjustments as will appear warranted upon consideration of the relative advantages of private and public organization.

JOHN BAUER,
Director, The American Public Utilities Bureau.

MUNICIPAL REFORM ACTS, English.

The body of laws passed by the English Parliament since 1833 dealing with municipal franchises, suffrage charters, etc. In the 14th and 15th centuries the municipal suffrage fell gradually more and more into the hands of restricted bodies of men. Notorious abuses crept into the system and the Parliamentary Reform Act of 1832 left the municipalities well nigh untouched as regarded charters, suffrage, etc. In 1833 a royal commission made an extended report on existing abuses, showing that most municipalities were ruled by venal cliques, funds were wasted or worse, public service was negligible, municipal courts were corrupt, etc. New legislation based on the commission's report was enacted in 1835 known as the Municipal Corporation Act, under which 178 boroughs were reformed and about 125 others created. The more flagrant abuses were corrected and means were provided by which other abuses might be eliminated. The franchise was extended to all property owners and occupiers of property of £10 (\$50) valuation or over and a uniform system of administration was provided under which an elected council of a size proportionate to the population of the borough was made into a bicameral body, the upper chamber to be composed of aldermen elected by the council. The mayor was to be chosen from among the councillors or aldermen by vote of both these bodies. In great part these features still constitute the municipal constitution of England, although various modifications have been made by subsequent act of Parliament. The Consolidated Municipal Code was passed in 1882 and six years later cities and towns with 50,000 or over population were constituted distinct counties, with municipal councils discharging the functions ordinarily exercised by county councils.

MUNICIPALITIES. Municipalities are as old as civilization itself. The story of the

nations of antiquity that flourished in the valleys of the Nile, Tigris and Euphrates is in large part the narrative of what went on in the imposing cities of Thebes, Memphis, Babylon and Nineveh. History gives us little accurate knowledge of these populous centers of the ancient world and the student of municipal government gains little from a scrutiny of the autocratic systems by which they were ruled.

Greece.—Real city life may be said to have been born in Greece. Largely due to geographical and topographical conditions which made community isolation inevitable, ancient Greece never became a unified nation. It was merely a geographical term applied to a group of independent, usually self-governing cities with the areas of land adjacent to them. The Greek city-state was the sole unit of government. The city was the state and the state was the city. A man was a foreigner in any city but his own. There were no distinctions between the duties and functions which in modern times we call national or state and those which were municipal. It is therefore perfectly proper that we should derive our words "politics," "political," and the similar terms by which we describe our public policies, institutions and concerns from *polis*, the Greek word for city. The Greek cities differed widely in government. In Sparta the governing power remained consistently autocratic or oligarchical, while in other Greek cities, notably Athens, the form of government fluctuated between autocracy and democracy.

Rome.—Early Italian history, like that of Greece, is the record of the development and struggles of a large number of city-states. The history of Rome as a nation is the history of the conquest or establishment of numerous cities bound together into one gigantic, unified system by the dominating power of Rome. As in Greece, city life and national life tended to merge. The government of the city of Rome itself, beginning with monarchy, progressed through various stages of democracy and representative government which were never completely lost even under the autocratic forms of the empire. There was little in the government of the cities outside of Rome, however, which could be called truly popular, and such democratic features as existed in the earlier period tended to diminish or disappear as the empire became more centralized. The political and civil rights conferred by Rome upon these tributary cities were usually made the basis for the imposition of heavy taxation. It is from the word *municipium* applied by the Romans to these dependent and partially self-governing cities that we derive our word municipality. In complexity of organization and in diversity of functions it may be safely said that municipal government and life at Rome at the height of its development rivaled that of the modern metropolis.

Medieval Cities.—During the Dark Ages municipalities seem to drop out of sight for the time being. The remnant of their powers and functions which was not lost in the general chaos was taken over largely by the church. The development of the feudal system in Europe, beginning with the 10th century, was destined to exert an important influence upon the life and position of municipalities. Its immediate result was a diminution of their already weakened power. The feudal lord who lived upon his

estate in the country held the cities within his domain as vassals, exercising over them the same feudal prerogatives as over the individuals on his land. In spite of feudal oppression the medieval cities prospered as centers of trade and commerce. With prosperity came wealth and with wealth came the power to bargain or to fight with the feudal barons. Many of the larger cities of Italy, such as Florence, Venice, and Pisa, were able to purchase something like independence, while the cities of northern Europe more frequently freed themselves by the sword. This was true of the powerful free cities of northern Germany, which during the 11th and 12th centuries cemented their commercial interests in the formation of the Hanseatic League. When the struggle for municipal rights was won either by barter or in battle, the cities secured the fruits thereof in a written treaty of peace or bill of rights called a charter. These charters, limited as they frequently were in the scope of the municipal freedom they guaranteed, may be said to have laid the foundations for modern constitutional government.

England.—English municipalities were subjected to the same feudal oppression which the more prosperous towns on the Continent suffered. They were not at first incorporated and had few political or civil rights and little if any self-government. They were small in area and population. London which was the metropolis then as now, had about 40,000 inhabitants at the beginning of the 15th century. As feudalism lost its grip these towns or boroughs became incorporated, and gained in power and independence usually because the extension of privileges made easier the collection of taxes by the feudal lord. It was for this mercenary reason that Edward I gave the English boroughs representation in the historic national parliament called in 1295. The political power which the cities thus acquired was of great potential value to the crown in the struggle it was then waging with the nobles. The establishment of the rule that no corporation was lawful without royal sanction gave the crown the chance it desired to dominate municipal affairs and control the selection of the borough representatives in Parliament. Finding that popular elections afforded an uncertain basis of control, the crown finally built up a sufficiently subservient municipal organization by creating a mayor and council selected in the first instance by the king and endowed with the power of self-perpetuation. It was not until the passage of the Municipal Corporations Reform Act of 1835, made necessary by the inefficiency and corruption in municipal life, that English city government ceased to be oligarchical and took on the general form it now bears—that of a representative governing body holding office for short terms and elected by popular vote.

United States.—American municipal history dates back to the chartered municipal corporations established in the English colonies in the 17th and 18th centuries. The oldest of these charters seems to have been the one given to New York in 1686. The charters were granted by the provincial governors and in the main the government consisted of a popularly elected board of councilmen and aldermen and a mayor appointed by the governor. Although not originally subject to the control of the colonial legislatures, these municipalities finally became so and found themselves under the necessity of

applying to the legislatures for additional grants of power, especially in the matter of taxation. After the American Revolution the state legislatures assumed that position of complete supremacy over American cities which they have ever since held.

Relation Between the City and the Central Government—England.—While cities are the organs for local self-government their functions do not end there, and the modern municipality finds itself bound to the state or nation within which it lies by a complex web of political, legal and governmental ties. The place of the city in the English administrative system may be sketched as follows: The city is a corporation created by Parliament. The municipality which desires a charter petitions for it and its petition is granted or rejected in accordance with a procedure which assures a fair consideration of the merits of the case. Needed amendments to the charter must be secured in the same way. The charters thus granted are similar in general outline but vary widely in the details of municipal organization and power. Powers are usually conferred upon English cities which are broad in scope and which create a system of local legislative autonomy. While Parliament remains the ultimate source of all English municipal authority, there has never been a disposition on its part wantonly to interfere in the affairs of single cities after the fashion of American legislatures. This is due partly to the control over and responsibility for legislation in Parliament which is centered in the Cabinet, making "log-rolling" and "pork-barrel" legislation impossible; it is also due to the essential nature of English municipal organization, politics and traditions which have prevented the English city from becoming the prey of partisan exploitation. Not only does the English national government exercise legislative power over the English city in the manner described, but it also exerts an administrative supervision over it. The most important agency for this central administrative control is the local government board. In a wide range of matters connected with municipal debts, municipal ownership, poor relief, and health, it is necessary for the city to secure the approval of this board for its projects. Administrative supervision of English cities is not centralized in one department however, but the board of education, the board of agriculture, the board of trade and the home office have varying degrees of authority over the municipal activities falling within their respective jurisdictions. The result of this central administrative control has been wholesome. There has been no serious infringement of municipal autonomy but a valuable check on municipal extravagance and inefficiency. The administrative agencies mentioned have been given wide powers and have been able to settle many of the questions of municipal administration and power which in the United States have been fertile sources of ill-advised interference by the legislature in municipal affairs. In short, the English system may be said to be one of legislative decentralization, in view of the whole legislative power given to English cities, and administrative centralization. (R.E.C.)

United States.—Much of interest has occurred in this country during the 20-year span, 1926-1946 in the municipal domain. In general, the technique of government has improved. But

the ideology of the national party system which regards the cities as appanages of the national parties persists and makes extremely difficult and evanescent putting improved methods into effect, or making possible a real merit system and life careers in local affairs for those most qualified to participate actively in them. The commission form of government, the precursor, at the beginning of the century, of the city manager form, is being found unworkable because of conflicts of jurisdiction among the commissioners and is being generally discarded. The city manager form (now preferably referred to as council-manager form, because giving recognition to the importance of the council in the plan) is supplanting the earlier form and spreading until it is utilized by more than 725 cities and towns, large and small. In the period 1941-1946, New England accounted for almost half the increase.

Some municipalities have conducted interesting experiments in efforts to solve their multiple problems. Thus, a few have tried to exert the power of excess condemnation; that is, appropriate more property than that absolutely required for the immediate project. The idea is for the city to acquire some of the enhanced value of property in the vicinity resulting from the improvement, to sell off some or all of such property as an assembled tract, and to control the neighborhood so as to make it harmonize with the principal object of the improvement. This method has been used successfully for years abroad; as, for example, the Kingsway in London. But in this country the effort has met with so much opposition, sometimes successful on constitutional grounds, that very little has been done with it.

The same may be said of setback procedure, whereby a city anticipating, with reasonable certainty, it will have to widen a thoroughfare at some time in the future, but not ready or able presently to do so, establishes a setback line beyond which owners are prohibited for a period of years from erecting substantial, permanent-type buildings. From the city's point of view, there is great economy in setback procedure, since, when condemnation is undertaken, large and costly buildings, or parts of them, need not be appropriated. For the landowner, however, such a caveat may amount to a severe interference with the use of his property. His opposition, therefore, is apt to be vigorous and has so often been effective that, in many instances, the experiment has been thwarted.

With limited access highways or freeways, the cities have had more success. These are similar to the strada or express highways common abroad. In order to avoid obstructions by traffic from intersecting highways and from the ordinary use of the street by abutters, there are no intersections at grade. The abutter has his right of access taken away and is required to reach the circulatory system of highways by other means.

Cities are coming to realize slowly that beauty is not a matter of whim and luxury, but has a certain practical value. One of the most interesting developments in municipal law is the groping toward a formula that will permit legal protection from ugliness. In some places, prohibition of overhanging signs and severe restriction on size and character of billboards, or even prohibition of them, and likewise requirements that

buildings in historic centers, such as the Vieux Carré in New Orleans, shall conform to the spirit of such centers, have been sustained.

These are examples merely of experiments that cities are obliged to make. Concomitantly, the conception of what is a public purpose has been liberalized in the courts. No public funds may be expended except for a public purpose. Formerly, public housing was often said by the courts (for example, in Massachusetts and Ohio) not to be a public purpose, because available only to certain groups. In the 1936-1946 decade, however, such housing was sustained, even in Massachusetts, to provide temporary low-cost housing in view of the housing shortage for returned veterans.

Many new functions have been imposed upon municipalities and they have had to meet rising costs, while, at the same time, their revenues and population have remained stationary or have been, in many instances, materially reduced. During the depression years, the strain of extraordinary relief problems accompanied by reduced income was particularly severe and often menaced their existence. The condition was aggravated by arbitrary tax limitations imposed by constitutions or statutes of the state, or through unfair and inadequate allocation of state collected funds, such as from automobile, gasoline, intangible, income or sales taxes. The movements to the outlying country and the tendency to create business cells in various sections of the city, displacing a single previously prevailing important business center, resulted in blighted areas, necessity of increased services and greatly diminished values of important tax revenue producing districts.

Among new functions imposed on the cities may be mentioned: establishing and maintaining airports, regulation of them and of the surrounding territory; establishment of city radio stations, municipal garages, parking lots, trailer camps, abattoirs, milk and ice stations, a city newspaper for official notices, public housing, advertising, greatly expanded zoning and planning with efforts to maintain these in terms of region, sometime even embracing territory in more than state of location; regulation of buses and bus terminals, as well as taxicabs and jitneys; adult education, pensions, credit systems, health and hospital care for employees, withholding from them of federal income tax and for required bond purchases. The number of functions assumed by municipalities in this country has not equaled that in England, Sweden and other countries. It has not been unusual, however, for municipalities in the United States to have public ownership of utilities, such as water supply, telephones, street railway, gas and electric production and distribution, municipal forests, pawnshops, cemeteries, universities, bands and orchestras, zoological gardens, extensive parks and recreation centers. Traditional activities have been expanded.

Accompanying this expansion, new problems have arisen to be met somehow. As illustrative only, and by no means all-inclusive, may be mentioned the growth of public employee unions with demands for recognition of such as bargaining agent for all employees, a closed shop, strikes or threats of strike involving suspension of vital services. Then there is the political pressure which such organizations can invoke so as sometimes to bring about undesirable legislation and

wage increases so unreasonable as to impose a severe strain on the credit of the city (for example, the transport union in New York City subways) even to the extent of impairing its credit; federal encroachments, such as income tax on salaries, persistent effort to tax income of municipal bonds, federal taxation on so-called proprietary function activities; interpretations of the United States Constitution protecting civil liberties to an extent sometimes preventing ordinary regulation of control of streets; and extension of the constitutional bankruptcy power to include municipal bankruptcies; taking by the federal government of much previously taxable property for federal purposes, such as public housing which entails furnishing of city services, but making the project nontaxable; federal regulations interfering with free public bidding and limiting cities' rent charges of their own properties and allowing federal building not complying with city regulations. Various so-called authorities have been created to conduct, with other than the regular city officials, some intra-municipal function, usually with funds derived only from revenues of the operation. While the revenue bonds which they issue are not general city obligations, these obligations should be taken into account in determining the overlapping debt of the local subdivision, since every community has a maximum of debt-servicing ability.

On the other hand, new conditions, instrumentalities, conceptions, mechanical appliances, have helped the cities. Two-way radios on police cars, motorized fire and police departments, bulldozers, tractors and road making and surfacing materials, dump trucks, consolidated purchasing, automatic check signers and stamping machines, punch cards for tabulation, photostat, microfilms,—all are examples. Then, too, reduced return on capital and the great demand for municipal bonds because interest on them is exempt, under present law, from federal income tax have enabled cities to borrow often at less than half the rate they formerly had to pay. Federal instrumentalities and decisions have lightened the cities' burden in public utility rate cases and sometimes with the threat of municipal ownership (q.v.), have resulted in materially lower charges for essential services. An authoritative ruling that, to determine the rate base, using the "prudent investment theory" instead of the ancient "cost of production less depreciation" formula is not an illegal denial of due process, alone has saved the cities hundreds of thousands of dollars in rate controversies before state public utilities commissions. Also, on the asset side are to be listed the leagues of municipalities, mayors conferences, International City Managers Association, various bureaus of governmental research, municipal reference libraries, agencies for the improvement of local government, such as the National Municipal League and the National Civil Service League, and their publications. These give to officials desirous of conducting municipal affairs economically and well the best experience of what has been done in other municipalities and the incentive to emulate successful achievement wherever it has occurred.

In no sphere of activity is there more stirring and greater opportunity for highest peacetime service than in the local governments. What is needed is not merely the making of studies and giving information which, if used, can make conduct of the affairs of cities more efficient and eco-

nomical. Merely knowing how, and exhortations in behalf of the merit system and the possibility of careers in local administrations are not enough. As a high duty of citizenship, sentiment must be created and maintained, that will require these public corporations to be administered as effectively as the best private corporations are conducted. Only then will what James Bryce termed many years ago "the one conspicuous failure of the United States" be erased. (M.S.)

Ordinance Power.—One of the powers which is invariably granted to municipalities is the power to pass ordinances which shall have the effect of law. The legislature may not, under our state constitutions, delegate its legislative power; but since a city is regarded as an administrative subdivision of the state, the courts have uniformly held it to be proper to endow it with a share of the state's legislative power. The power to pass ordinances is hedged about by many limitations express or implied, which may be summarized as follows: First, where the procedure to be followed in passing an ordinance is set forth it must, save where the procedure prescribed is found to be directory, not mandatory, be adhered to or the ordinance will be void. Second, ordinances must not be passed in excess of the power delegated to the city. Third, there must be no violation of the provisions of the national or state constitutions or statutes. Fourth, since every power not expressed to do the very thing is granted to a municipality under the implied condition that it will be reasonably exercised, any ordinance will be void which is unreasonable by being oppressive, discriminatory, unduly restrictive of trade, in contravention of common right or public policy. The invalidity of part of an ordinance does not vitiate the entire ordinance if the valid and invalid portions are separable, and it can be said the ordinance with the invalidity eliminated can stand and would have been passed.

Power of Taxation.—The power of the American city to tax must be given either by express or implied grant. It is usually specifically conferred, but if not it may sometimes be implied from the grant of other powers for the exercise of which revenues are necessary. When not limited by provisions of the state constitution, the state legislature has complete control over the city's power of taxation. It may in its discretion extend, curtail or revoke it in general or with reference to special taxes, subject to one restriction. It may not take away the power of a city to tax so far as such taxing power is the only means of paying an existing debt. The amount of the taxes which a city may raise for municipal purposes may be left to its discretion but very commonly the city tax rate is limited either by the statutes or constitution of the state. The rules governing the procedure of assessment and collection of municipal taxes are usually set forth in the enabling legislation and must be strictly followed. The courts will compel a city against its will to exercise its taxing power to the extent necessary to satisfy claims of its creditors.

Police Power.—The power to pass ordinances for the protection of the public health, safety, morals and general welfare of the municipality is commonly conferred upon cities by express grant. It may sometimes be implied however, from a general grant of power to pass certain ordinances. It is under this authority

that municipalities make enactments relative to the preservation of peace and order, sanitation, the protection, regulation of amusements and occupations and the control of vice. When exercised by the city the police power is subject to all the usual constitutional restraints against arbitrary and discriminatory enactments. The city is incapable of parting with its police power by making any grant, concession, exemption or contract. Its police ordinance may deal with subjects already covered by state law provided the ordinance does not conflict with the statute. The power to pass police ordinances carried with it a implication the authority to establish and enforce reasonable penalties. Such ordinances may be enforced either by penalties inflicted upon individuals, injunction, or by summary destruction of private property which is a public nuisance.

Municipal Contracts.—The power to make contracts is given to all municipalities by express grant or by implication. Such contracts have the same general legal character as contracts between individuals but the city must not exceed its power. If the procedural requirements in the city charter are not complied with, the contract is void. Where cities enter into contracts for the securing of services or goods, it is commonly required that the city must call for sealed bids based upon plans and specifications and that the contract must be let to the lowest responsible bidder. If it can be clearly shown that a city did not have the requisite authority to make a given contract, such a contract is void. Cities are, however, bound by the principles of common honesty and in cases where its contracts are illegal because of hidden defects of procedure or noncompliance with other formal requirements, the city may still be bound. It may elect to ratify such contracts and ignore the irregularities, or, under what is known as the doctrine of estoppel, it may be prevented by the courts, if not void, from setting up its own illegal acts for the purpose of freeing itself from its just obligations. The contracts of a municipality are enforceable in court before judgment like other contracts and neither the city nor the state legislature may by ordinance or statute impair their obligation. Thus, the statute of limitations may, in almost all cases, be invoked against a city. Municipalities are subject to injunction, in proper cases, and to contempt proceedings for violation of injunctions. But execution against essential city property is not permitted to satisfy judgments. The remedy for enforcement of these is usually by mandamus to compel the levy of a tax sufficient to satisfy the judgment.

Miscellaneous Powers.—The American municipality enjoys several powers which do not call for elaborate discussion. It may appropriate and spend money for purposes within its authority and in accordance with the procedure outlined in its charter. It may, within these same limits, acquire, manage and dispose of property. It may construct public improvements and in so doing may use the power of eminent domain and levy special assessments. Its power to incur debts, own and operate public utilities and services and grant franchises are treated in separate articles. See ASSESSMENTS; FRANCHISES; MUNICIPAL UTILITIES; PUBLIC UTILITIES.

Liability of Municipalities.—A municipality is not like a sovereign state, immune from suit without its consent. On the other hand, since in

the performance of many functions it is an agent of the state, its legal liability is not so wide as that of a private corporation. The rules governing the civil liability of the city are, accordingly, complex. In the first place, its liability upon all contracts which it has legally made is absolute and may be enforced in the usual way. Secondly, the city is not liable in damages for the torts or legal wrongs resulting from the performance of its governmental powers and functions, except in cases of nuisance. This immunity rests partly on the theory that the city performs these functions as an agent of the state which is immune from suit, and partly on the theory that it is contrary to public policy to expose the revenues of the city to the drain which an unrestricted liability might entail. This immunity extends to the injuries resulting from negligence or misconduct of the city's officers and agents, or from faulty construction, repair or maintenance of its property used for governmental purposes. By governmental functions or powers are meant those pertaining to protection of public peace, health, safety, education, and charity, in contrast to the commercial or quasi-private enterprises on which modern cities may embark. The municipality is never liable, furthermore, for the tortious acts of its officers when they have exceeded their legal authority. In such a case usually the injured person may sue the officer individually and recover damages. The state legislature may create by statute municipal liability which would not otherwise exist. In the third place, the municipality is liable in tort for the injuries resulting from performance of nongovernmental or commercial functions such as the operation of certain utilities, as well as from the use of property not used for governmental purposes. Furthermore, a legal obligation rests on the city to exercise reasonable care in keeping its streets, highways, bridges, and viaducts, safe for ordinary use and it is accordingly liable for the injuries resulting from a breach or neglect of this duty. On the whole the modern tendency is to broaden rather than to curtail civil liability of the municipality. (R.E.C.)

(M. S.)

MURRAY SEASONGOOD,
Former Mayor of Cincinnati.

MUNJISTIN (purpuroxanthin carboxylic acid), an orange-coloring matter closely allied to purpurin and to alizarin, which occurs in munjeet (East Indian madder), and has the formula $C_{14}H_8(OH)_2O_6COOH$. It may be changed into purpuroxanthin by boiling with alkalis; also by heating it above 448° F., its melting point. It dissolves in boiling alcohol, separating again, upon cooling, in the form of brilliant golden flakes. Munjistin gives an orange-yellow color when used as a dye with aluminum mordants, which, however, is not fast either as to light or soap. With iron mordants it gives a brownish purple, which is fairly permanent. Munjistin is one of the compo-

nents of commercial "purpurine," also known as "Kopp's purpurine."

MUNKACS, now **MUKAČEVO**, Czechoslovakia, town in Carpathian Ruthenia, located on the Latorcza River and on the Bályu-Munkács-Lavoczne-Stryj state railway. Its industries consist of vineyards, coarse cloth making, spirit distilleries, petroleum refining, lumber, cattle and grain trade. In the vicinity the noted "Hungarian diamonds" (rock crystal) are mined. Close by are productive alum and iron mines. Built on a high rock in the plain is the historic fortress, usually utilized as a state prison, that was first built in 1359. It was surrendered (1688) to the Austrians after withstanding a siege of three years under the brave leadership of Helen Zriny, wife of the patriot Emmerich Thökölys. Franz Rákóczi II (1703) was defeated here by the Austrians under Nigrelli and the place was surrendered (1708) to the latter. Alexander Ypsilanti was imprisoned here from 1821-23, and the famous painter Munkacsy was born here. Pop. about 20,000.

MUNKÁCSY, moon'kächē, **Michael**, Hungarian painter: b. Munkács, Hungary, now Czechoslovakia, 10 Oct. 1846; d. Eendenich, near Bonn, 1 May 1900. His real name was Lich, but he is known only under the assumed name derived from that of his birthplace. Beginning life as a carpenter, he met the strolling portrait painter, Szamossy, in Gyula, who was so much struck by the artisan's interest in art that he gave him painting lessons. Munkácsy proceeded to paint portraits and genre pictures, taking his subjects from common country life. One of these early canvases, 'A Country Idyll,' was purchased by the Art Union of Pesth. He eventually put himself under the instruction of the battle-painter, Franz Adam, at Munich. He made rapid progress and the Hungarian government awarded him the first prize for genre paintings thrice in succession and he was thus enabled to take up his residence at Düsseldorf and to study under Knaus and Vautier. The first great picture he painted was 'The Last Day of a Condemned Man,' (in the collection of Mrs. W. P. Wiltach, Philadelphia) exhibited in the Paris Salon in 1870. This was followed in 1871 by 'Wartime' (an episode in the Hungarian war. The succeeding year he made Paris his home and his pictures began to attract growing attention. He painted many small genres of singular power and character, such as 'Going to School'; 'The Kitchen Politician'; 'The Butter Woman'; 'The Pawn Shop' (1874) (Metropolitan Museum, New York); 'The Workshop' (1875); but as his strength and mastery of his art grew he rose to loftier subjects, religious and historical. In 1877 he painted 'Milton in his Blindness Dictating Paradise Lost,' to which was awarded the gold medal at the Paris Exposition. It is now in the Public Library, New York. Great as was the sensation created by this picture, a historic genre of remarkable coloring in gray and black and of profound insight and power of characterization, an even deeper impression was produced by his 'Christ Before Pilate' (1882), which some critics consider the greatest religious picture of its century. This vast canvas is startling in its freshness of conception, its living action, the mingled grandeur and pathos which the artist has infused into his

treatment of the central figure, as well as its masterly composition and technique. It has been exhibited in all quarters of the civilized world and was bought by John Wanamaker of Philadelphia for \$120,000. It was followed by his dramatic 'Christ on Calvary,' the religious intensity of which is heightened by the accurate fidelity to differing national types with which the spectators of the Crucifixion are portrayed; a piece of realism whose suggestiveness is obvious. In 1886, he produced 'The Last Moments of Mozart,' now in the collection of Gen. Russell Alger, Detroit, Mich. The present owner paid \$50,000 for this pathetic picture, in which the composer is listening to his still uncompleted requiem, sung at his bedside by his favorite singers, the night before his death. The last three years of his life this painter suffered from mental alienation and closed his days in a sanitarium. In addition to the works already mentioned, 'The Music Room' and 'The Two Families' are in the Metropolitan Museum in New York; 'The Prowlers of the Night' is in the Pennsylvania Academy, Philadelphia, and 'The Story of the Battle' is in the Walters Gallery, Baltimore. Consult Tait, T. R., 'Michael Munkácsy' (in *American Art Review*, Vol. II, Boston 1881).

MUNKAR. See MOHAMMEDANISM

MUNN, **Charles Clark**, American novelist: b. Southington, Conn., 1848; d. 8 July 1917. Bred on a farm which he left at 17, for 30 years he was engaged as a commercial traveler. From 1910 he was editor of the *Commercial Travelers' Magazine*. He was the author of several popular novels, including 'Peckett Island' (1900); 'Uncle Terry: a Story of the Maine Coast' (1900); 'Rockhaven' (1902); 'The Hermit' (1904); 'The Girl from Tim's Place' (1906); 'Boyhood Days on the Farm' (1907); 'Myrtle Baldwin' (1908); 'The Castle Builders' (1910); 'The Spice of Life' (1911); 'The Heart of Uncle Terry' (1915); 'Camp Castaway' (1916).

MUNN, **George Frederic**, American artist: b. Utica, N. Y., 1852; d. 1907; began his early studies in art under Charles Calverly, the sculptor and also in the National Academy of Design, New York. Afterward he entered the art schools at South Kensington, England, and there won a gold medal, the first award of the kind to an American. His clay model of the Farnese Hercules won the award. He also was the winner of a silver medal at the Royal Academy for life drawing, and in 1876 entered the studio of George F. Watts. He traveled in Brittany, where he painted and sketched and was a frequent exhibitor at the Dudley Gallery, London, and elsewhere. Among his best-known works are 'Wild Flowers,' 'Roses,' 'Meadow Sweet' and 'A Sunny Day in Brittany.' Consult Munn, Margaret Crosby and Cabot, Mary R., 'The Art of George Frederic Munn,' with an Introduction by Sir Johnston Forbes-Robertson (New York 1916).

MUNN, **Orson Desaix**, American publisher: b. Monson, Hampden County, Mass., 11 June 1824; d. New York, 28 Feb. 1907. He was educated at the academy in Monson, was a clerk and country storekeeper there until 1846, and then bought the *Scientific American*, which he made one of the leading scientific papers of the

country. Other periodicals owned by him were the *Scientific American Supplement* (1876–), and *Architects' and Builders' Edition* (1885–), now *American Homes and Gardens*. He was also head of Munn and Company, patent solicitors.

MUNRO, Dana Carleton, American historian: b. Bristol, R. I., June 7, 1866; d. New York City, Jan. 13, 1933. He was graduated from Brown University in 1877, then studied (1889–1890) at the universities of Strasbourg and Freiburg. He was instructor and assistant professor of Roman and medieval history at the University of Pennsylvania (1893–1902), professor of European history at the University of Wisconsin (1902–1915), and professor of medieval history at Princeton University (1915–1933); he was chairman of the department of history there (1915–1928). From 1894 to 1902 he was editor of *Translations and Reprints from Original Sources of History*, and published *Medieval History* (1902); *A Source Book of Roman History* (1904); *Syllabus of Medieval History* (1910); *Common Treatment of Conquered Territory* (1918); *A Guide to the Study of Medieval History* (1931).

His son, **DANA GARDNER MUNRO** (1892–1942), was a historian and diplomat. He served in the Latin American division of the United States Department of State from 1921 to 1925, and in 1929 became chief of that division. He was United States minister to Haiti (1930–1932); and professor of Latin American history and affairs at Princeton University from 1932.

MUNRO, Hector Hugh, pseudonym SAKI (să'ki), British author: b. Akyah, Burma, Dec. 18, 1870; d. Beaumont-Hamel, France, Nov. 13, 1916. A refreshingly imaginative satirist whose career was cut short by death in action with the Royal Fusiliers in World War I, he is best known for fictional pieces distinguished by gaiety, dialogue and narrative. Educated in grammar schools at Exmouth and Bedford, England, he returned to Burma in 1893 and was commissioned in the Burma police. The following year he reappeared in England, where he delighted readers of the *Westminster Gazette* with political sketches in the Lewis Carroll manner, issued under the name of Saki (cupbearer in the *Rubāiyāt of Omar Khayyām*), and later published in 1902 as *The Westminster Alice*. From 1902 to 1908, he traveled in the Balkans, Russia, Poland, and France, as foreign correspondent for the *Morning Post*. Meanwhile, after being sidetracked by his only serious study, *The Rise of the Russian Empire* (1900), he turned to writing the short stories, published as *Reginald* (1904) and *Reginald in Russia* (1910), on which his reputation rests. These collections as well as *Chronicles of Clovis* (1911) and *Beasts and Superbeasts* (1914) reveal Saki's inviting whimsical humor and biting wit at their best. While not neglecting his penchant for political satire in these stories, he frequently portrays blithely irresponsible young men and queer and exotic animals in fantastic settings. With his fondness for flaying the pretentiously self-righteous and negatively dull, Saki reveals a flippant annoyance with adults, and a contrasting sympathy and understanding for their victims, children. Stylistically, his lack of conventional plot structure is usually more than compensated for by his fertility of invention and mastery of the unexpected phrase.

His other works include: *When William Came* (historical fantasy picturing life in Britain under German rule, 1913); *The Unbearable Bassington* (novel, 1912); *The Square Egg* (1924, with a biographical sketch by E. M. Munro); and several plays, including *The Death-Trap*; *Karl-Ludwig's Window*; and *The Watched Pot* (with Charles Maude).

MUNRO, Wilfred Harold, American historian: b. Bristol, R. I., Aug. 20, 1849; d. Providence, R. I., Aug. 9, 1934. He was graduated (1870) at Brown University, receiving (1873) the A.M. degree. He spent 1873 in South and Central America. From 1875–1879 he was principal at Le Roy (N. Y.) Academic Institute, and was president of De Veaux College from 1881–1889. He studied at the universities of Freiburg and Heidelberg (1890–1891), when (1891–1899) he became associate professor of history and director of university extension at Brown University, and professor of European history (1899–1911), then emeritus professor. He published *Legends of Mount Hope* (1915); *Tales of an Old Seaport* (1917); *Among the Mormons in the Days of Brigham Young* (1927); editor, *Works of W. H. Prescott* (1905–1906).

MUNRO, William Bennett, American political economist: b. Almonte, Ontario, Canada, Jan. 5, 1875. He was graduated (1895) at Queen's University, Canada, receiving the degrees M.A. (1896) there, LL.D. at Edinburgh (1898), Ph.D. at Harvard (1900). He studied (1900–1901) at the University of Berlin and was (1901–1904) instructor of history and political science at Williams College, then, successively, instructor in government (1904–1906), assistant professor (1906–1912) and professor of municipal government (1912–1925) at Harvard University; Jonathan Trumbull professor of American history and government (1925–1929), and Edward S. Harkness professor of history and government (1929–1945), and since 1945 treasurer, California Institute of Technology. His writings include: *The Government of European Cities* (1909); *The Initiative, Referendum and Recall* (1911); *The Government of American Cities* (1912); *Principles and Methods of Municipal Administration* (1916); *The Government of the United States* (1919); *Municipal Government and Administration*, 2 vols. (1923); *The Governments of Europe* (1925); *Makers of the Unwritten Constitution* (1929); *American Government Today* (1930); *Municipal Administration* (1934).

MUNROE, Charles Edward, American chemist: b. Cambridge, Mass., May 24, 1849; d. Forest Glen, Md., Dec. 7, 1938. He took degrees at Harvard and George Washington universities, and taught in both institutions. He was professor of chemistry at the United States Naval Academy (1874–1876). He invented indurite, the first smokeless powder used in big guns by the United States Navy, the discovery of the formula of which he made while engaged in chemical research at the Naval Torpedo Station, Newport, R. I. (1886–1892). He also discovered the "Munroe effect," casting a new light on the nature of the detonation wave of nitroglycerine. He taught chemistry at Harvard (1871–1874); and was consulting expert to the United States Geological Survey, the United States Bureau of Mines, and the Civil Service Commission.

MUNROE, Henry Smith, American mining engineer: b. Brooklyn, N. Y., March 25,

1850; d. Litchfield, Conn., May 9, 1933. He was graduated (1869) at Columbia and received (1877) the degree Ph.D. He was (1870-1871) assistant geologist of the Ohio State Geological Survey; assistant chemist, United States Department of Agriculture (1870-1872); assistant geologist and mining engineer of the Geological Survey of Yesso, Japan (1872-1875). In 1875-1876 he was professor of mining and geology at the University of Tokio; then successively adjunct professor of surveying and practical mining (1877-1891); professor of mining (1891-1915), and emeritus professor in 1915 at Columbia University. He was also dean of the faculty of applied sciences (1897-1899) and member of the university council (1895-1915). He was manager (1881-1884), then vice president (1890-1892) of the American Institute of Mining Engineers, and was (1908-1909) president of the Mining and Metallurgical Society of America and (1909) president, Society for Promotion of Engineering Education.

MUNSEE INDIANS, an American tribe of the Delaware family, originally one of the three great divisions of that race. They were sometimes called the Wolf tribe of the Delawares. They resided along the Delaware River, and in New York, Pennsylvania and New Jersey. During the Revolution many of the Munsees removed to Canada, where at Thames, Ontario, there are some survivors. At Green Bay, Wis., is another tribal remnant and a third remnant is found in Kansas. See also DELAWARE INDIANS.

MUNSELL, Joel, American printer and antiquarian: b. Northfield, Mass., April 14, 1808; d. Albany, N. Y., Jan. 15, 1880. He established himself in Albany in 1827, and was publisher and editor of the *New York State Mechanic* from 1841 to 1843. At various times he was the publisher of the *Unionist*, the *Albany Daily State Register*, *Morning Express* and *Statesman*, and other journals. Munsell made a close study of the art of printing, in its history and application, and his collection of works on the subject, the largest in America, was in part purchased by the state for the New York State Library. He contributed papers to the *Transactions* of the Albany Institute, of which he was a founder, and published *Outline of the History of Printing* (1839); *The Every-Day Book of History and Chronology* (1843); *Annals of Albany*, 10 vols. (1850-1859); *A Chronology of Paper and Paper Making* (1856); and *Manual of the First Lutheran Church of Albany, 1670-1870* (1871).

MUNSEY, mŭn'sī, Frank Andrew, American editor and publisher: b. Mercer, Me., Aug. 21, 1854; d. New York, Dec. 22, 1925. He became manager of a Western Union telegraph office in Augusta, Me. He went to New York in 1882 to become editor and publisher of *The Golden Argosy*, a juvenile weekly, which he afterward changed into a monthly for adults under the style of *The Argosy*. *Munsey's Weekly* appeared in 1889 and after issuing this for one year he transformed it also into a monthly calling it *Munsey's Magazine*. He added other magazines, and later went into the newspaper field, buying the *New York Evening Sun*, *Daily News*, *Press*, *Sun*, *Herald*, *Telegram*, etc., and papers in other cities. He was a pioneer in the publication of cheap illustrated magazines, *Munsey's* being the first

magazine to be sold at ten cents a copy. At one time or another he owned and published various other magazines including the *Scrap Book*, *Quaker*, *Puritan*, *Woman*, *Live Wire*, *Cavalier*, and *Railroad Man's Magazine*. He was the author of several books: *Afloat in a Great City* (1887); *The Boy Broker* (1888); *A Tragedy of Errors* (1889); *Under Fire* (1890); *Derringforth* (1894). He left the bulk of his fortune (estimated at the time of his death at \$40,000,000) to the Metropolitan Museum of Art.

MUNSON, James Eugene, American inventor: b. Paris, N. Y., May 12, 1825; d. New York, 1906. He was educated at Amherst College, and in 1857 removed to New York, where he was court stenographer for 30 years. He invented the "Munson System" of shorthand, a machine for operating the typewriter by telegraph and a typesetting machine. He published *The Complete Phonographer* (1866); *Dictionary of Practical Phonography* (1875); *A Short Course in Munson Phonography* (1900); *Phonographic Dictation Book* (1904); *Munson's Pocket Dictionary of Phonography* (1906).

MUNSON, Thomas Volney, American horticulturist and plant breeder: b. Astoria, Ill., Sept. 26, 1843; d. Denison, Tex., Jan. 21, 1913. His early education was obtained in the rural district schools, followed by a course in an Academy at Lewiston. He subsequently took a course in a commercial college after which he entered the University of Kentucky, whence he was graduated in 1870. Shortly after completing his education he married and removed to the vicinity of Lincoln, Nebr. In 1873 he became interested in the improvement of the various species of the native American grapes and planned to do systematic work in the way of developing new varieties by cross-pollination and hybridization. The experiments thus undertaken were doomed to failure because of climatic rigors and a visitation of the Rocky Mountain locusts. Undismayed, he sought a new location, settling at Denison, Tex., in 1876. There climatic conditions were much more favorable to the prosecution of such experiments and, moreover, wild grapes were more abundant and profuse. He engaged in the nursery business and in the breeding of new varieties of grapes and also growing them upon a commercial scale. During the ensuing 25-year period, he produced and experimentally fruited no less than 150,000 new varieties of grapes, many of which were far superior to those hitherto in common cultivation. Only the very best of these were selected for propagation and dissemination and so rigid and exacting was the process of elimination that but 50 varieties were retained for introduction and cultivation as a permanent addition to American viticulture. He became recognized as a botanist as well as a viticulturist; a volume entitled *Native Trees of the Southwest* having been prepared under the direction of the United States Department of Agriculture. But his specialty was always the grape and he became the recognized authority on the native wild grapes of North America. His horticultural and scientific work in hybridizing and perfecting the American grapes won recognition abroad as well as at home. In appreciation of his service in producing and introducing resistant stocks with which to re-

store the phylloxera infested vineyards of France, the French government conferred upon him the diploma and decoration of the Legion of Honor, with the title of "Chevalier du Merit Agricole," in 1888. He wrote 'Classification and Generic Synopsis of the Wild Grapes of North America' (issued as Bulletin No. 3 of the Division of Pomology, United States Department of Agriculture, Washington, 1890). The most complete botanical display of the whole grape genus ever made was prepared by Mr. Munson and exhibited at the World's Columbian Exhibition at Chicago in 1893 and has since been preserved by the United States Department of Agriculture at Washington. He was the founder and for many years the president of the Texas Horticultural Society and was a member of a number of learned societies, including the American Horticultural Society, the National Agricultural Association of France, the American Pomological Society, the American Breeders' Association and the American Association for the Advancement of Science. His volume 'Foundations of American Grape Culture' (1909), embodied the practical results of more than 30 years of patient, painstaking investigation, experimentation and observation and must long remain the leading treatise of its class. His work, which may be justly said to have been monumental in its significance and beneficence, was continued until his death.

MUNSTER, Ireland, the southwest and largest of the four provinces of that country, bounded on the north by Connaught, on the east by Leinster, and on the west and south by the Atlantic Ocean. It has an area of 9,316 square miles and is divided into the counties of Clare, Cork, Kerry, Limerick, Tipperary and Waterford. Pop. 969,902, 94 per cent Roman Catholics.

MÜNSTER, mün'stér, Prussia, the capital of Westphalia, a city and episcopal see, in a plain on the Aa, at the junction of several railways and on the Dortmund-Ems canal, 78 miles northeast of Cologne. The site of its mediæval ramparts has been converted into promenades. The principal edifices are the 13th century cathedral, the church of Saint Lambert, the Rathaus, exchange, museum, theatre, the Pauline Library, etc., and the university, founded in 1788. The manufactures include woolen, linen and cotton goods, leather, sugar, starch, beer, etc. Münster originated in a monastery around which a settlement arose in the 12th century; it was long governed by martial bishops. The most notable event in its long history occurred in 1532-35 when the city fell into the hands of the Anabaptists (q.v.). Pop. about 106,000.

MUNSTERBERG, mün'ster-bërg, Hugo, German-American psychologist: b. Dantzic, Germany, 1 June 1863; d. Cambridge, Mass., 16 Dec. 1916. He was graduated at the Dantzic Gymnasium in 1882, and pursued post-graduate studies in physiology, philosophy, natural sciences and medicine until 1887. He received the degree of Ph. D. at Leipzig in 1885 and that of M.D. at Heidelberg in 1887. After this he was instructor and assistant professor of psychology in the University of Freiburg at Baden, Germany. In 1892 he came to America at the

invitation of Harvard University, Cambridge, Mass. He was professor of experimental psychology and director of the Psychological Laboratory in Harvard from that time until his death. His scholarly work was partly psychological, partly philosophical. After 1900 he gave special attention to the new field of applied psychology, in particular to the application of psychology to education, medicine, law, commerce and industry. He was a member of the Psychological Association (president 1898), of the Philosophical Association (president 1908), the Washington Academy, of the American Academy of Arts and Sciences, etc. He was organizer and vice-president of the International Congress of Arts and Sciences at the Saint Louis World's Fair 1904, vice-president of the International Psychological Congress in Paris 1900, vice-president of the International Philosophical Congress at Heidelberg 1907, etc. In 1910-11 he was Harvard exchange professor at the University of Berlin and during that year founded the Amerika-Institut in Berlin. During the whole period of his American stay he worked for the improvement of the relations between the United States and Germany, writing in America for a better understanding of Germany and in Germany for a higher appreciation of America. The outspoken views of Professor Münsterberg on the issue of the War of 1914 raised storms of controversy about his head. He appeared as probably the most eminent supporter of German policies in America, and as such was most bitterly condemned by the Entente Allies and their friends, while to the pro-Germans he appeared almost an idol. While supporting German policies, Professor Münsterberg denounced many of the activities of the Teutonic hyphenates in this country. He condemned the forming of an alien party within the United States as "a crime against the spirit of true Americanism," and said that its results would reach far beyond the time of the war. Professor Münsterberg's early writings in Germany were exclusively devoted to experimental psychology. During his sojourn in America he published the following works, some of which have been translated into many languages: 'Psychology and Life' (1899); 'Grundzüge der Psychologie' (1900); 'American Traits' (1902); 'Die Amerikaner' (1904; revised 1912); 'Principles of Art Education' (1905); 'The Eternal Life' (1905); 'Science and Idealism' (1906); 'Philosophie der Werte' (1907); 'On the Witness Stand' (1908); 'Aus Deutsch-Amerika' (1909); 'The Eternal Values' (1909); 'Psychotherapy' (1909); 'Psychology and the Teacher' (1910); 'American Problems' (1910); 'Psychologie und Wirtschaftsleben' (1912); 'Vocation and Learning' (1912); 'Psychology and Industrial Efficiency' (1913); 'American Patriotism' (1913); 'Grundzüge der Psychotechnik' (1914); 'Psychology and Social Sanity' (1914); 'Psychology, General and Applied' (1914); 'The War and America' (1914); 'The Peace and America' (1915); 'The Photoplay, A Psychological Study' (1916). He was also a large contributor of psychological and philosophical articles in the scientific magazines and of social, political and practical psychological articles in the popular periodicals.

MUNTJAC, a small East Indian deer representing the genus *Cervulus*, which resembles

the musk-deer in many points, especially in the male's having long, sharp upper canine teeth or tusks, which are effective weapons. These little deer, only about 22 inches high at the shoulder, live in hilly jungles. The bucks have lyrate, single-pronged antlers on tall pedicels; the does lack antlers. Six species are known in India (where they are called Kakars) and parts of southeast Asia. Popularly they are called barking deer from their cry of alarm. An alternate generic name is *Muntiacus*. The best known species is *M. muntjac*.

MUNZER, münt'sër, **Thomas**, German religious reformer and fanatic: b. Stolberg am Harz, c.1489; d. by execution, Mühlhausen, Thuringia, May 30, 1525. An Anabaptist, he joined Luther at Wittenberg in 1519 and the same year was a member of his entourage at the Leipzig debates. He soon disagreed with Luther on theology and became increasingly radical in his socio-political views as well, claiming direct communion with the Holy Spirit. While he was pastor at Zwickau (1520-1523) he tried to propagate his radical views at Wittenberg. His demagogic preachings and attempts to excite rebellion among peasants and workers through advocacy of the overthrow of the social order and establishment of a godly communist state resulted in his expulsion from Zwickau, Allstedt and Mühlhausen. At the outbreak of the Peasants' War (q.v.) Münzer returned to Mühlhausen with Heinrich Pfeiffer, another preacher, took control of the town council and established a communist theocracy. Philip, landgrave of Hesse, defeated the peasant forces at Frankenhäusen, May 15, 1525, and Münzer was among the leaders executed.

MUNZINGER, möönt'sing-ër, **Werner**, Swiss explorer and linguist: b. Olten, Solothurn Canton, April 21, 1832; d. Aussa district, north-eastern Ethiopia, Nov. 15-16, 1875. He went to Egypt in 1852, led a trading expedition to the Red Sea (1854), settled briefly at Massawa, then made an expedition to East Africa (1855-1861). Second in command of the Heuglin expedition, on the leader's death he headed it. In 1872 he was appointed by the Khedive governor general of the eastern Sudan. On an expedition to find out whether Menelik, king of Shoa, later Menelik II (q.v.), emperor of Ethiopia, would consider an alliance with Egypt, Munzinger and his wife were killed by Galla tribesmen. He wrote grammars of native tongues and travel accounts.

MURAD, name of five Ottoman sultans:

MURAD I (1326-1389), reigning from 1362 until his death, was the first of the Ottomans to extend conquests to Europe, making Adrianople his European capital; completed organizing the Janizaries (q.v.). He took Sofia (1382) and was killed in his victory of Kossovo.

MURAD II (1403-1451), ruling from 1421-1451, patron of writers and scholars, reunited the Ottoman state, fought Hunyadi and Scanderberg and subdued the Morea (1446).

MURAD III (1546-1595), who ruled from 1574-1595, continued war with Austria, and seized (1590) large areas of the Persian Empire. The decline of the Ottoman Empire is usually dated as beginning with his reign.

MURAD IV (1609-1640), sultan from 1623 to 1640, curtailed the power of the palace troops, and captured Baghdad from Persia (1638).

MURAD V (1840-1904) ruled for a few months in 1876. For most of his early life he was confined by a jealous uncle, Sultan Abdul Aziz. On the latter's deposition Murad acceded, but was deposed as insane (Aug. 31, 1876), and confined until his death.

MURAENA. See **MORAYS**.

MURAL PAINTING is that branch of painting and design which is concerned with the enrichment of the walls and ceilings of buildings. Other techniques of architectural decoration used for the same purposes include mosaic, stone, or wood inlay, sgraffito, and bas-relief sculpture. Tapestry is woven material hung with similar intent.

A mural painting must always be related in design to the building of which it is a part. Its function in some instances may be only ornamental; but a fine work of mural art transcends the purposes of mere decorative embellishment, it may record the past, glorify the present, or symbolize aspirations of the future as well as playing its part in a geometric architectural unity.

Principles.—The general principles of good architectural design must govern the construction of a mural painting in its abstract, or design elements. Architecture is concerned with the creation of hollow volumes or complexes of volumes, in materials which are suitable to the time place, and uses of each structure. Mural decoration is only a further development, in terms of meaningful ornament, of the expression of the architectural idea in space and volume. Good ornament contributes to making the building seem psychologically suitable to its uses; the ornament may be called functional because people work and play better in appropriately decorated rooms, but a mural painting may also educate, remind, uplift, entertain, inspire fear or hope or any feeling which can be expressed in visual symbols.

Since the functions of buildings and rooms are various, it follows that many different kinds of mural painting exist. A bank, a factory, a gymnasium, a hospital, or a nursery, each has its own requirements. Mural painting may vary from the intimate to the monumental.

One of the qualities of good architecture is its relative permanence, and this affects the attitude of the mural painter as to technique, style, and subject matter. The muralist is always more concerned than is the easel painter with the lasting values of his work. He is slower to experiment with novelties, while being intensely interested in new methods which may add durability to his painting. He is the philosopher and historian among painters, and also the scientist and engineer. He is usually a deliberate, steady, and craftsmanlike worker, because a large mural demands sustained effort combined with consistency in style. A successful work must reflect calmness, co-operativeness, sympathy, and understanding for the feelings and viewpoints of many different people: the mural painter is a "public" artist, in his way a public servant.

For these reasons it is considered that a mural work using illustrative content should confine itself to truly epic subject matter. Passing or trivial events do not deserve presentation in monumental, enduring form. Perhaps the journalistic cartoon might be thought of as the proper antithesis to true mural painting. Murals whose painters have attempted to express current political

error have seldom stood the tests of time. In dealing with history in the making, the mural painter must be something of a prophet and seer to distinguish the enduring from the temporary.

Methods of Mural Painting.—Permanence and suitability to architectural surroundings are chief factors in the mural painter's choice of the medium to be used for a particular work. This choice will otherwise be dictated by the style of painting which the artist finds most adaptable to the expression of his idea. New media develop as the artists of a period find the established methods inadequate for their needs, and for this reason they are best studied in their historical contexts.

A widening knowledge of the history of art has brought about the appreciation of many little known styles and techniques of earlier times. Prehistoric man painted on the walls of caves in Altamira and the Dordogne. Of a much later time are the Buddhist paintings done on the walls of the cave temples of Ajanta in India and prior to the 7th century A.D. In early Egypt and in Crete most murals were painted using flat color and near silhouette, the earliest known being the famous *Geese of Meidum* belonging to the Egyptian Old Kingdom (2900–2750 B.C.). Of all the ancient works studied by painters of the modern era, probably those of the Egyptians, Greeks, and Pompeians have been most influential in forming Western mural styles.

Prehistoric cave painters made their drawings directly on the rough sandstone with natural earth pigments, much as pastel is used today; in most cases preservation is due to the accidental formation of a transparent film of limestone deposited by water seepage over their surfaces. Early painters mixed adhesive gum with their pigments, probably gum acacia or gum arabic in the case of Egyptian mural works.

Cretan painting, such as that in the Palace of Knossos, c.1500 B.C., presents some of the earliest known examples of the use of fresco, which was to become one of the most important media employed in architectural decoration during many centuries. In this manner of painting the pigment is ground in water or lime water and applied to a surface of fine plaster before the plaster has become completely crystallized. The pigment is bound to the plaster surface through the interlocking of slowly forming crystals of lime carbonate, as the lime oxide returns to its original form upon exposure to the carbon dioxide of the air. An area of about a square yard is prepared and completed at a time, this being considered a day's work by the *frescanti*. Succeeding sections of plaster will show a fine indentation where they join; the indentations are planned to follow the edges of color planes in the design.

The traditional palette of the fresco painter is limited to the natural earth colors, such as yellow ochre and terra verde; the burnt earths, such as Venetian red; and a few other lime-fast colors, such as cobalt blue. Few organic dyes or synthetic colors are fast in the presence of lime. Pigments prepared by grinding potters' glazes or frit pigments found some use as early as Egyptian times. True fresco becomes more luminous with age, due to the increasing transparency of the plaster surface as the lime crystals become completely carbonated.

The process described above is that of true fresco, which requires that when a mistake has been made, the outer coat of that particular section of plaster must be removed and renewed. Re-

touching has sometimes been done with the use of *fresco secco*, or dry fresco, in which the binder is albumen or casein distemper; but it has seldom proved permanent. The Italians distinguish true fresco as "*buon fresco*."

True fresco and dry fresco both were practiced by the Greeks, Romans, and Pompeians, although the Roman artists preferred the harder materials of mosaic and stone inlay. True frescoes also appear in early Christian and Byzantine churches; but they rise to their greatest heights in works of the Italians of the Renaissance, beginning with the painter Cimabue. This fine fresco work followed a period in which mural painting had for a time been superseded as wall decoration by the mosaics of the Byzantines, as seen in Saint Sophia, at Ravenna, and at St. Mark's in Venice; and by the stained glass of the Gothic north.

Two great schools of art developed at this time in northern Italy, producing murals done in both fresco and tempera. These were of the school of Giotto and his followers, whose works may be seen in the lower church of St. Francis at Assisi, in the churches of Santa Croce and Santa Maria Novella at Florence, and in the Arena Chapel at Padua; and the school of Siena. Artists of both schools traveled widely and influenced art in other regions. The work of the Siennese remained essentially medieval in character, while the art of the Florentines, followers of Giotto, changed to meet the needs of the new and spreading doctrine of humanism. Masaccio's mural painting, *The Tribute Money* in the Brancacci chapel of the church of Santa Maria della Carmine at Florence, signaled a further development in style from Giottesque painting; and during the 15th century other distinctive styles developed in Umbria, Rome, and northern Italy.

As men's attention became diverted from the medieval preoccupation with extra-worldly matters to an examination of the world around them, painting kept pace with scientific observation. Artists, re-imbued with the Greek ideal of man as the center of all things, painted and anatomized the human figure, developed theories of vision which became laws of light and shade and mathematical perspective. Piero della Francesca of Umbria, in his magnificent frescoes at Arezzo depicting the *Visit of the Queen of Sheba to Solomon*, demonstrated his scientific knowledge of architectural geometry and anatomy in common with Greek idealization of the human figure, which had become the Florentine goal in painting. Luca Signorelli, in his murals of the *Last Judgment* in the Cathedral at Orvieto, exhibits knowledge of the anatomy and movement of the human figure rather than concern with religious symbolization.

Two fresco painters who emerged from the Florentine group executed works in Rome in the first half of the 16th century which may be said to have exerted more influence upon the art of the Western World than any other paintings until comparatively recent times. One of these was Raphael Sanzio, whose Umbrian studies under Perugino are thought to account for his rich use of color. Raphael's Vatican frescoes known as the *Stanza* have long been models for students of classic work. Michelangelo Buonarroti, who considered himself primarily a sculptor, became a prisoner of war in the attack of Pope Julian's forces upon the Florentine Republic and was ordered, in spite of his protest, to decorate the ceiling of the Sistine Chapel in fresco. As an

architect, engineer, and sculptor, Michelangelo was in disagreement with the round-vaulted ceiling. He used his Florentine knowledge of space drawing to destroy its architectural effect. Instead we see a series of flat, bas-relief sculptural panels symbolizing the Creation, divided by painted beams, supported in turn by painted pilasters. The power and magnificence of the work is unquestioned. It remains a *tour de force* of the art of fresco, but it is also a great monument to a rebellious spirit, by which the mural painter demonstrated his refusal to approve the architecture of which his work was a part.

The style of Florentine painting was developed in terms of the use of fresco and tempera; both media encourage careful, planned work with reliance upon clearly drawn outlines, in a color range somewhat more limited than that of oil paint. The tempera medium was much used for smaller works of both Sienese and Florentine schools, executed upon wood panels first coated with gesso, a preparation of plaster and glue, employing egg yolk as a binder.

Early Flemish painters of northern Europe adopted as binding media linseed oil (oil of flaxseed) and varnishes prepared from pine pitch, in creating miniatures and small paintings to harmonize with the rich wood-paneled interiors of their region. Wall spaces which in the southern countries would call for large mural decorations here were needed for light-giving stained glass. The deep, enamel-like brilliance of underpainting and overglazing was well suited to their purposes.

It is believed that Domenico Veneziano, a Florentine traveler, introduced the northern craft of oil painting to the Florentines; but not until the sensuous Venetians rebelled against Florence's intellectual abstraction did the rich effects of oil painting become exploited in the mural decorations of Italy. Titian, a successful fresco painter early in his career in the Scuola del Santo at Padua, later became a virtuoso in the oil paint medium. His *Assumption* for the church of Santa Maria Gloriosa dei Frari, Venice, is the first oil painting to contain human figures as large as those in the biggest frescoes. Unfortunately Titian's murals for the Palace of the Doges were destroyed by fire; they were considered by contemporaries to be his greatest.

Titian's vigorous and glowing work was carried forward by Jacopo Robusti, known as Tintoretto. The careful, craftsmanlike processes which characterized the methods of the Florentines could not compete with the free, direct painting and the ease of correction of errors offered by the oil method.

Many baroque palaces of the time were richly decorated after the Venetian manner. Paolo Cagliari, known as Veronese, excelled in creating scenes of pompous splendor; his ceiling for the Doges' Palace, and various paintings for the church of San Sebastiano were typical examples of the mural work then most acceptable. Peter Paul Rubens, basing his style upon the works of Veronese, Michelangelo, and Raphael, carried the international baroque manner through all of Europe's capitals. Among his mural commissions were the decorations for the Luxembourg Palace for Marie de' Medici and the ceiling of Whitehall in England. In Spain, Domenikos Theotokopoulos, called El Greco, executed somber, emotionally intense decorations which combined Byzantine abstraction with Venetian breadth. His *Burial of the Count of Orgaz* in

the Church of Santo Tomé at Toledo, is one of his best known works.

The French baroque style may be represented by the frescoes done in the Church of Val de Grace by Pierre Mignard, who headed the official French Academy under Louis XIV.

Mural painting enters a lighter phase in the rococo period which followed. Representative of his times as a mural decorator was François Boucher, whose work appears in Versailles, in the Bibliothèque Nationale at Fontainebleau and in the château of Madame de Pompadour at Bellevue.

Neither the neoclassic period nor the era of romanticism which followed were good ones for mural work; but Jacques-Louis David among neoclassicists and the romantic Théodore Chassériau, who influenced Puvis de Chavannes, left enough impression upon later muralists to deserve mention.

Mural painting in England and Germany paralleled French work to some extent and included experimentation with fresco, oil, and tempera media and also spirit-fresco, a kind of wax painting, and water-glass. In Germany the names of Peter von Cornelius, Peter von Hess, Julius Schnorr von Carolsfeld and Wilhelm von Kaulbach come to the fore. In England a revival of mural decoration was carried forward in Victorian times by Thomas Gambier Parry, Charles West Cope, Sir Edward Poynter, and Frank Brangwyn, whose murals, executed for the San Francisco Panama-Pacific Exposition in 1915, are now set into the walls of the Veterans' Memorial Theater in San Francisco. These last are excellent examples of the influence of Impressionist light painting upon the art of the mural.

Most innovations have represented attempts to reproduce the quality of classic fresco without bowing to its limitations. Since the end of the Renaissance period, with the increasing separation in interests of painter and architect, a great majority of mural decorations have been executed for buildings already in use, making fresco inconvenient. In addition, reinforced concrete construction is chemically inimical to fresco unless elaborate precautions are taken to insulate the fresco plaster from metal or concrete. Oil paint as a medium is sensitive not only to free alkali from plaster, but also to moisture; careful priming is necessary. Also to be considered is the fact that many modern buildings are relatively impermanent; a work of art which is an integral part of the structure is difficult to save when it is torn down. It is little wonder that the French method of *marouflage* has been used by modern muralists for many years: affixing to a wall a canvas previously painted in the studio. This practice has indeed often obscured the difference between easel and mural painting; many a mural has been executed by an artist who may never have seen the building in which it would go, and who might be only vaguely aware of the color and scale of the rooms or walls involved. This is said to be true of the murals done by Puvis de Chavannes for the Boston Public Library, and of the abstractions more recently contributed by Fernand Léger to the auditorium of the United Nations building in New York City.

The first true mural paintings executed in the United States were those done by John La Farge for the Trinity Church in Boston in 1876. With the work of this painter and his group began the development of American mural painting as a consciously distinct art. Associated with La

MURAL PAINTING

large in this enterprise and others were William Morris Hunt, Edwin Austin Abbey, Henry O. Walker, Kenyon Cox, John Singer Sargent, and Edwin Blashfield. In his book, *Mural Painting in America* (1913), Blashfield stresses the debt of American mural painters to the training of Paris and the continued study of Renaissance masters, as well as modern influences like their favorite, de Chavannes.

These painters borrowed not only the style, but also the systems of symbols used by classic and European muralists. Greek and Roman deities or Biblical personages sometimes appear incongruous as symbols for forces of the modern world. Figures from American history in classic garb or in classic nudity appear in many mural paintings of the time. Only in later years did costumes of the period become acceptable in monumental works.

After admitting the neoclassic and eclectic nature of this first American school of mural painting, Blashfield goes on to say: "The style of Perugino and Pinturicchio is very beautiful, and may be used to great advantage in America, but it is not final; no style is." With public approval of the work of this group, which appeared in the 1891-1893 Columbian Exhibition in Chicago, their style became established in spite of Blashfield's wise prediction. So long as America's leading architectural firms were dominated by the official style of the French Beaux Arts Academy, mural painting in large public buildings conformed to the classic-baroque tradition, even after most easel painters had long since discarded it.

As European styles of painting changed, so did those of America, and American mural painting responded, although slowly. Romanticism, with emphasis on emotion, is reflected in the works of John Singer Sargent. Impressionism, characterized by concern for atmosphere and light, is well represented in American mural painting by the works of the followers of the Englishman, Frank Brangwyn. But Cubism and Expressionism often involving obscure personal symbolism and formal ideas not yet understood by the public were for some time confined to the field of easel painting.

In the 1920's, attention was once more focused upon monumental mural painting by a group of artists for whom the Mexican revolution provided both theme and opportunity. The first important murals done by Diego Rivera appeared in the Mexican National Preparatory School, executed in encaustic. Here also José Clemente Orozco painted his first great frescoes. Work by David Alfaro Siqueiros, also done at this time, represented a successful attempt to combine fresco with encaustic. In spite of his unquestioned powers, Siqueiros' work displays a revolutionary violence and indifference to the accepted limitations of true mural work as to technique, form, and content.

These ambitious works were only the first of a tremendous series of monumental decorations by Mexican painters. Rivera and Orozco also executed commissions in the United States, among which are those by Orozco at Detroit and at Pomona College in California, and by Rivera in the Stock Exchange of San Francisco. Rivera's projected frescoes for Rockefeller Center in New York City were never completed because of a disagreement with his sponsors regarding a representation of Lenin in the design.

This fresh impetus given to mural painting by the work of the Mexican painters strongly influenced many artists of the United States for the duration of the government art projects set up in the 1930's under the Roosevelt administration. An unexampled flow of many kinds of art work was produced, much of which took permanent form as mural decoration in public buildings throughout the country. On the Pacific slope, notably, muralists made use of rediscovered antique methods of architectural decoration, such as mosaic in its many forms, and the unique cut stone work, or *opus sectile*, to be seen in the Alameda County Court House, Oakland, California.

The Public Works of Art Project of the Treasury awarded commissions through competitions in which a large number of competent artists participated. Among the works thus produced are the murals by Anton Refregier for the Rincon Branch of the Post Office at San Francisco. These consist of a series of casein paintings which may well be accepted as a norm of modern mural style. They present various symbols of the social progress of the State of California in a manner which is both contemporary and eclectic in the best sense.

Under the Federal Art Project of the Works Progress Administration appeared many other works, such as the highly praised murals by Philip Guston, *Maintaining America's Skills*, for the New York World's Fair.

Although government art sponsorship lasted for only eight years, by this encouragement so many artists received training in mural painting, and understanding and public demand were so increased, that opportunity for the contemporary muralist in the United States has been greatly expanded. Almost no public building of any pretensions is now planned without considering the desirability of integrated architectural decoration, whether sculpture, mosaic, inlaid stone or true mural painting.

MURANO, mōō-rā'nō, town in the Province of Venice and situated on an island in its

lagoons, one and a half miles north of Venice. It contains the very ancient basilica, San Donato Cathedral, which was repaired as early as the 12th century; a 16th century Renaissance church (San Pietro Martire) with its altar painting by Bellini. The town has for centuries been world-renowned for its glass industry (see GLASS), the wonderfully artistic delicate blown-glass ware being highly valued in the collections of connoisseurs. It also has a glass-industries museum. The noted Venetian pearls also are manufactured here. Consult Molmenti, 'Le isole della Laguna Veneta' (Venice 1895).

MURAT, mü-rä, Joachim, French marshal and some-time king of Naples: b. Bastide, Lot, France, 25 March 1771; d. Pizzo, Calabria, Italy, 13 Oct. 1815. He was the son of a prosperous innkeeper of La-Bastide-Fortunière, near Cahors, France, and had a remarkable career. While studying for the priesthood at Toulouse he enlisted in a cavalry regiment but was soon dismissed for insubordination. He served in the constitutional guard of Louis XVI; then entered the 12th regiment of mounted chasseurs and rose by his zealous Jacobinism to the rank of lieutenant-colonel. He attached himself to Napoleon in 1795, and followed him to Italy and to Egypt. In these campaigns he frequently distinguished himself, and in 1799 Napoleon appointed him general of division. He clung close to the great leader and returned to France with him from the disastrous Egyptian campaign. At a time when everything depended on prompt action he rendered Napoleon most valuable service by dispersing the Council of Five Hundred at Saint Cloud, on the memorable 18th Brumaire. In gratitude and as a reward Napoleon entrusted him with the command of the Consular Guard, and shortly after (20 Jan. 1800) gave him his youngest sister, Caroline, in marriage.

Murat had command of the cavalry at the battle of Marengo and expelled the Neapolitans from the Papal States. In 1803 he was made a member of the *Corps Legislatif*, and in 1804 was the governor of Paris. On the establishment of the Empire Murat became one of the popular idols, and was showered with honors. He was made marshal of the empire, grand-admiral, and prince of the imperial house. His services in the campaign of 1805 against Austria, in which he entered Vienna at the head of the army, were rewarded in 1806 with the grand-duchy of Cleves and Berg. He participated in the battles of Austerlitz, Jena, Eylau and Friedland. In the war of 1806 with Prussia, and of 1807 with Russia, he commanded the cavalry, and in 1808 he commanded the French army which occupied Madrid, and quelled the insurrection there in May. He expected to receive the crown of Spain, as Charles IV had invested him with royal authority; but Napoleon, who destined Spain for his brother Joseph, placed him on the throne of Naples, 15 July 1808. He then took the title of Joachim I. Ferdinand IV (q.v.), however, continued to rule in Sicily under English protection. Murat proved a beneficent king and instituted some reforms, but he was, after all, but the tool of Napoleon. He shared the hardships and reverses in the disastrous Russian campaign of 1812, and returned to Naples discouraged and discontented. In 1813 he again fought for Na-

poleon, whose cause he deserted after the battle of Leipzig. He entered into a treaty with England and Austria in 1814 which guaranteed him his throne on condition that he would join the coalition against Napoleon. He pretended to keep this treaty by attacking Eugene Beauharnais in a half-hearted manner. He took up arms again in 1815 for Napoleon; but being defeated by Generals Neipperg and Bianchi he was forced to leave Italy, and took refuge in Toulon. His offers of aid were spurned by Napoleon. After the overthrow of Napoleon, he escaped to Corsica, declining the offer of an asylum in Austria which was made to him by Metternich, and set sail for the Neapolitan territory with a view to the recovery of his kingdom. He foolhardily landed at Pizzo on 8 October, but was immediately captured, tried by court-martial, condemned and shot. Murat was vain, unstable and full of ambition. As a cavalry leader his dashing bravery inspired his men with almost superhuman courage. As king, he proved himself sincerely eager to initiate genuine reforms, and did much to abolish banditry. Consult Attridge, A. H., 'Joachim Murat' (New York 1911); Espitalier, A., 'Napoleon and King Murat, 1808-15' (New York 1911); Helfert, 'Joachim Murat, seine letzten Kämpfe und seine Ende' (Vienna 1878); Johnston, C. H. M., 'Napoleonic Empire in Southern Italy' (2 vols., New York 1904); Lumbroso, A., 'Correspondance de Joachim Murat' (Milan 1899); Murat, Count, 'Murat, lieutenant de l'empereur en Espagne' (Paris 1897); Romano, G., 'Ricordi muratiani' (Pavia 1890); Sorel, A., 'L'Europe et la révolution française' (8 vols., Paris 1885-92).

MURAT, Napoleon Achille, French American author: b. Paris, 21 Jan. 1801; d. Waccesissa, Leon County, Fla., 15 April 1847. He was the son of Joachim Murat, king of Naples, and before his father's overthrow bore the title of Prince of the Two Sicilies. When his father lost the throne he sought refuge in Austria, where he received his education. In 1821 he came to the United States, and after an extended tour through the country bought a large estate and settled near Tallahassee, Fla., where he devoted himself to farming and literary work; he also gave largely to and was active in philanthropic enterprises. He became a United States citizen, and in 1824 was made alderman of the city of Tallahassee, in 1825 mayor and in 1826 postmaster. He accompanied Lafayette during most of his visit to the United States. He married, in 1826, Mrs. Catherine Gray, a daughter of Byrd C. Willis of Virginia and a grandniece of Washington. He refused many offers of political advancement, and lived quietly on his estate. In 1828 he published in the Paris *Revue Trimestrielle* a series of letters on political parties in the United States, which were later published as 'Lettres d'un Citoyen des Etats Unis à ses Amis d'Europe'; in 1838 he published 'Esquisses morales et politiques sur les Etats Unis d'Amérique'; and 'Exposition des Principes du Gouvernement républicain tel qu'il a été perfectionné en Amérique' (Exposition of the Principles of Republican Government as Perfected in America). This latter work was very popular

among those of republican sympathies in Europe, was translated into several different languages and passed through over 50 editions. Consult MacConnell, 'The Prince and Princess Achille Murat in Florida' (*Century Magazine*, New York 1893).

MURAT, Napoléon Lucien Charles, PRINCE OF PONTE CORVO, French politician, second son of Joachim Murat: b. Milan, 16 May 1803; d. Paris, 10 April 1878. He left Italy for Austria with his mother in 1815; started for the United States in 1824 to join his uncle Joseph, but was shipwrecked on the Spanish coast, and held prisoner for a time; arrived in Boston in 1825; and in 1827 married an heiress of Bordentown, N. J., Georgina Fraser, who was soon afterward reduced to school teaching for her living. Murat returned to Paris in 1848, sat in the Constitutional Assembly and in the Legislative Assembly (1849), was Minister to Turin (1849-50), had his debts paid and received a pension of \$30,000 a year under Napoleon III, and in 1859-60 made a feeble claim to the crown of Naples, but received no support from France. His vote in the Senate, where he sat from 1852 to 1870, for the temporal power of the Pope, alienated from him the French Freemasons, whose grand-master he had formerly been. He retired to private life after the revolution of 4 Sept. 1870.

MURATORIAN FRAGMENT, or **CANON OF MURATORI**, a fragment from an ancient Bible treatise discovered in the Ambrosian Library at Milan by Lodovico A. Muratori and published (1740) in his 'Antiquitates italicæ.' It contains an imperfect list of the books in the New Testament, and is considered highly important as testimony of at least a list of some of the works considered canonical at the time of writing, which is supposed to be late in the 2d century. The much damaged documentary fragment is in florid Latin, probably translated from the Greek. The books are named in their order and start with mention of the Gospel of Saint Mark on its first line which is broken and probably contained mention of Matthew as Saint Luke's Gospel is mentioned as third. Saint John, the Acts, 13 epistles of Saint Paul are cited (omitting Epistle to the Hebrews), the Revelation of John, Jude, two epistles of John (James is omitted, also Peter), but the Apocalyptic part of John and that of Peter are accepted, as is also Wisdom of Solomon as being written by his friends. A translation is to be found in H. W. Gwatkins, 'Selections from Early Christian Writers' (New York 1893) and Lietzmann's 'Kleine Texte für theologische Vorlesungen, No 1' (Bonn 1902). Consult Kühn, 'Das muratorische Fragment' (Zürich 1892); Tregelles, 'Canon Muritorianus' (Oxford 1867).

MURAVIEFF, moo-rä-vē-ēf', Russian noble family, originally settled in the grand-duchy of Moscow, but in 1488 receiving from Ivan Vassilievitch holdings in Novgorod. Its chief members are NIKOLAI JEROFYEVITCH, d. Montpellier 1770, governor of Livonia and author of the first Russian algebra. MIKHAIL NIKITITCH, b. Smolensk, 25 Oct. 1757; d. Saint Petersburg, 29 July 1807; was chosen tutor to the grand-dukes Alexander and Konstantin in 1785, rector of the University of Moscow

(1796), and Secretary of State to the Ministry of Public Instruction (1801); and wrote a manual of ethics, which is classic in Russia (1810, 1815). NIKOLAI NIKOLAEVITCH, son of the governor of Livonia: b. Riga, 1768; d. Moscow, 1 Sept. 1840; was educated at Strassburg; entered the navy 1788; was captured in 1790; was transferred to the army in 1796; and from 1797 to 1823, with the exception of service against Napoleon in 1812-14, he was at the head of a private military school near Moscow, which was bought by the government in 1816. His son, ALEXANDER NIKOLAEVITCH, b. 1792; d. Moscow, 1864; was sent to Siberia for his part in the conspiracy of 1825; was pardoned; served in the Crimean War and became major-general; and as governor of Nijni Novgorod did much for the abolition of serfdom. Another son, NIKOLAI NIKOLAEVITCH, b. Saint Petersburg, 1793; d. there, 4 Nov. 1866; entered the army at 17; served in the Caucasus; was sent to Khiva 1819; distinguished himself in the war with Turkey, 1828-29, and in the Polish campaign, 1831; in 1832 treated with Mehmet Ali; was disgraced and retired in 1838, but reinstated in 1848; and in 1855 commanded the army in the Caucasus, taking Kars. He wrote a valuable book about his travels in Khiva (1822), and on the campaign in the Caucasus in 1855 (1876). His brother, MIKHAIL NIKOLAEVITCH, b. 1795; d. Syrez, near Luga, 10 Sept. 1866; fought against France (1812-13); took part in Decembrist uprising and was jailed for five months; became major-general in 1830; was military governor of Grodno; was a member of the Council of State, 1850-62; opposed the emancipation of the serfs; used such cruelty in putting down a student rising in 1861 that he was forced to resign; but in 1863 was sent to Wilna as governor-general, and won from the Poles the name of the Hanger or Executioner by his pitiless severity; and in 1866 was president of the commission which examined Karakasoff, who attempted to assassinate Alexander II. His memoirs were published by his grandson, MIKHAIL NIKOLAEVITCH, b. 7 April 1845; d. 21 June 1900; Ambassador to Berlin (1885), to Copenhagen (1893); and from 1897 to his death Foreign Minister. He did much to solve the Cretan question, published the invitation to The Hague Peace Conference (1898), and forwarded Russia's interests in China. Another NIKOLAI NIKOLAEVITCH, COUNT MURAVIEFF AMURSKY, b. Saint Petersburg, 1809; d. Paris, 19 Nov. 1881; fought in the war with Turkey, 1828-29; became governor-general of eastern Siberia in 1847; in 1858 concluded the Treaty of Aigun with China, by which Amur was ceded to Russia, and thus won the title Amursky; and in 1859 arranged a treaty with Japan at Yeddo. The last 20 years of his life were spent in Paris. The Muravieff-Apostol branch of the family, so called because of its intermarriage with that of Apostol, a Cossack hetman, is most prominently represented by IVAN (1769-1851), who translated Aristophanes, Horace, Sheridan, etc., into Russian; and by his son SERGEI (1796-1826), who took part in the conspiracy of 1825 and was executed in Saint Petersburg.

MURCHISON, mēr'ki-sōn, SIR Roderick Impey, Scottish geologist: b. Tarradale, Ross,

Scotland, 19 Feb. 1792; d. London, 22 Oct. 1871. He was educated at the military college in Great Marlow and at the University of Edinburgh; entered the army in 1807 and served under Wellington in the Peninsular campaign, but retired from the army with the rank of captain of dragoons in 1815. He then took up the study of science at the advice of Sir Humphry Davy and spent years in scientific investigations, particularly in that of geology. In 1825 he became a member of the Geological Society of London, of which he was president in 1831–32 and in 1842–43. His investigations extended through France, England and Wales and he reclassified Palaeozoic rocks, giving to his new system the name Silurian in 1835. He also identified the Devonian system. In 1841 he was commissioned by Emperor Nicholas to make a geological survey of Russia and was engaged in that work until 1844, making discoveries which enabled him to present to the scientific world the Permian system. He was one of the founders of the British Association for the Advancement of Science and presided over it in 1846. He was several times elected president of the Royal Geographical Society and from 1862 until his death was continuously re-elected. In 1855 he was appointed director of the British Geological Survey. He was knighted in 1846, became a knight commander of the bath in 1853 and a baronet in 1863. The Emperor of Russia conferred on him the grand crosses of Saint Anna and of Saint Stanislaus. He published 'Geology of Cheltenham' (1834); 'The Silurian System' (1839); 'Geology of Russia in Europe and in the Ural Mountains' (1845); 'Geological Atlas of Europe' (1856), etc. Consult Geikie, 'Memoir of Sir Frederick Murchison' (1875).

MURCHISONITE, a flesh-red variety of the mineral orthoclase, which exhibits golden-yellow reflections when viewed from certain directions. It occurs at Dawlish and Exeter, England, and is named for its discoverer, Sir Roderick I. Murchison.

MURCIA, mēr'shī-ə (Sp. moor'thē-ā), Spain, the capital of the ancient kingdom and modern province of same name, 30 miles northwest of Cartagena, on the Segura, which divides the town into two unequal portions, connected by a handsome bridge. The city is surrounded by a brick wall and is entered by three principal gates. The streets are generally broad, straight and well paved. Among the public buildings the most important is the cathedral, its principal façade a fine combination of Corinthian and composite architecture. It was begun in 1353. In the plaza stands the capacious episcopal palace, built in 1752, one of the finest edifices of its class in Spain, and in close proximity to it the colleges of Saint Fulgentius and Saint Isidore, which form one range of buildings. The bishop takes his title from Cartagena, from which town the see was transferred. The other public edifices and institutions consist of the College of Saint Leander, which is an academy of music connected with the cathedral; the hospital of Saint John, with which is connected a hospital for convalescents; a house of refuge, a foundling hospital, the town-house, an institute for advanced education, a school of design, an ecclesiastical seminary, several nunneries, a bullring, two theatres,

an old Moorish granary and a good botanic garden. There are manufactures of coarse cloths and baize of different colors; of silk stuffs, especially taffeta and plush; linens, hats, gloves, salt-peter; also silk spinning-mills, dye works, potteries, tanneries, soap-works and about 30 flour-mills. Considerable commerce is carried on in silks and other manufactures as well as in grain, etc. Pop. about 150,000.

MURDER. See HOMICIDE.

MURDOCK, mēr'dōk, James Edward, American actor: b. Philadelphia, Pa., 25 Jun 1811; d. Cincinnati, Ohio, 19 May 1893. He made his début as an actor in Philadelphia in 1829, playing Frederick in 'The Lover's Vow,' and in 1833 acted with Fanny Kemble during her American tour. In 1838 he appeared in New York as Benedick in 'Much Ado About Nothing.' He played Pythias to Edwin Forrest's Damon and in 1842 retired from the stage to study. He reappeared in New York in 1845 as Hamlet and for 15 years played with considerable success in the United States and England. During the Civil War he devoted himself to caring for the wounded soldier and in giving entertainments for their benefit. Later he became professor of elocution at the Cincinnati College of Music. His best rôle were Hamlet, Mercutio, Benedick and Claud Melnotte, in which he had few equals. He published with William Russell 'Orthophony' (1845) and 'The Stage' (1885).

MURDOCK, Joseph Ballard, American rear-admiral: b. Hartford, Conn., 13 Feb. 1851; d. Manchester, N. H., 20 Mar. 1931; graduated from U. S. Naval Academy (1870); served on North and South Atlantic stations (1870–74), and was carrying out coast surveys from 1875–79. From 1880–1903 he was instructor of physics at the naval academy. During the Spanish-American War he was executive officer of the *Panther* and became a commander in 1901, captain in 1906, rear-admiral 1909. He commanded the *Rhode Island* in the cruise of the fleet (1907–09) around the world and was commandant at the navy yard, New York, from 1909–10, having command of the second division Atlantic fleet (1910–11), and was commander-in-chief, United States Asiatic fleet (1911–12), retiring 1913. He wrote 'Notes on Electricity and Magnetism' (1884). He was recalled to active service in 1918, and in 1921 and 1923 served in the New Hampshire legislature.

MURDOCK, Victor, American legislator: b. Burlingame, Kan., 18 March 1871. He was educated at the common schools and at Lewis Academy, Wichita, and became managing editor of the *Wichita Daily Eagle* (1894–1903). He was elected a Republican to the 58th Congress in 1903, re-elected for 59th to 63d Congresses (1905–15) for the 8th Kansas district and was a member of the Federal Trade Commission from 1917 to 1924. In 1918 he was appointed member of the Meat Commission of the United States government. He joined the Progressives and was chairman of the Progressive National Committee from 1914–16. He wrote 'China the Mysterious' (1920); 'Folks' (1921).

MURDOCK, William, Scottish inventor: b. Bellow Mill, near Old Cumnock, 21 Aug. 1754; d. Sycamore Hill, near Soho, 15 Nov.

839. He went in 1777 to Birmingham, where he obtained employment in the famous engineering establishment of Boulton and Watt, located in the industrial suburb of Soho. A demand for Watt's pumping engines came from the Cornish mines and Murdock was soon sent there to superintend the erection and fitting of these engines. In 1800 he was made manager of the works of Boulton and Watt, later becoming a partner.

His invention of coal-gas lighting remains his most conspicuous achievement. In 1792 he began his experiments regarding the illuminating properties of gases produced by distilling wood, peat, and coal. By 1800 he had an experimental gas apparatus in operation at Soho, and in 1802 his work of illumination was employed to celebrate the news of the Peace of Amiens. In 1803 the Boulton and Watt foundry was regularly lighted by that means.

In February 1808, Murdock read before the Royal Society a paper detailing his investigations. Gaslighting fell into the hands of promoters, and in 1809 Murdock was compelled to publish a vindication of his claims in "A Letter to a Member of Parliament." It has been asserted that he invented the steam locomotive, but the three engines he made did not materialize.

MUREX, mŭ'rĕks, a genus of gasteropod mollusks typical of the family Muricidae, resembling the whelk; shell spiral, rough, with three or more ranges of spines simple or branched. Muricees are remarkable for the beauty and variety of their spines. They were in high esteem from the earliest ages on account of the purple dye that some of them yielded. *M. pomum*, which is not so spiny as some of its congeners, is found on our coasts from Cape Hatteras to Texas. It is two to three inches long. The oyster drill (*Urosalpinx cinerea*), which uses its buccal ribbon to bore into oyster shells, is closely allied to *Murex*. See also PURPLE SHELL.

MUREXIDE, mŭ-rĕk'sid, in chemistry, the hydrogen-ammonium salt of a hypothetical acid called purpuric acid, the acid itself not being known in the free state. Murexide has the chemical formula $C_8H_4O_6N_4NH_4 \cdot H_2O$; about 1855 it was largely used as a dye. The colors that it gives are fast so far as light is concerned, and are quite brilliant; but they tarnish quickly when exposed to sulphur dioxide gas, and hence are more or less fugitive in houses where coal gas is burned. As a dye, murexide has now been replaced by coal-tar colors. It may be prepared by oxidizing a mixture of uric acid with nitric acid, evaporating to dryness and moistening the reddish residue with ammonia or ammonium carbonate. The beautiful purple red of murexide is at once developed. This reaction is used in urine analysis as a test for uric acid. Murexide crystallizes in short four-sided prisms, brownish red in color with green and yellow iridescence, dissolves in water to a beautiful purple solution, the color changing to blue upon the addition of potash. The commercial supply of murexide, when it was used as a dye, was prepared from the uric acid of guano. A dye similar to murexide, and perhaps identical with it, was obtained by the ancients from a gland of the murex, or purple-fish, whence the name "murexide."

MURFREE, mŭr'frĕ, Mary Noailles, nŏ-ĭ', (pseudonym CHARLES EGBERT CRADDOCK), Amer-

ican novelist: b. near Murfreesboro, Tenn., Jan. 24, 1850; d. there, July 31, 1922. Except for a few years in St. Louis, her life was spent in her birthplace. Her careful studies of life in the mountains of Tennessee, where her summers were usually spent, are reflected in nearly all of her books. Her earliest short stories appeared in the *Atlantic Monthly* in 1878 and were followed by others over the signature of "Charles Egbert Craddock." In 1884 these stories were published under the title *In the Tennessee Mountains* (q.v.). Until her identity was revealed in 1885, they were supposed to be the work of a masculine writer.

Miss Murfree's other works include: *Where the Battle Was Fought* (1884); *Down the River* (1885); *The Prophet of the Great Smoky Mountains* (1885); *In the Clouds* (1886); *The Story of Kcedon Bluffs* (1887); *The Despot of Broomsedge Cove* (1888); *His Vanished Star* (1894); *The Mystery of Witch-Face Mountain* (1895); *The Phantoms of the Foot-Bridge and Other Stories* (1895); *The Young Mountaineers* (1897); *The Story of Old Fort Loudon* (1899); *A Sceptre of Power* (1903); *Storm Centre* (1905); *The Windfall* (1907); *The Fair Mississippian* (1908); *The Story of Duciehurst* (1914).

MURFREESBORO, mŭr'frĕz-hŭr-ŏ, city, Tennessee, seat of Rutherford County; altitude 575 feet; on the West Fork of Stones River; served by the Nashville, Chattanooga and St. Louis Railroad; 33 miles southeast of Nashville. It also has an airport. The city is the central shipping point for an agricultural region. Nearby are cedar forests. The making of buckets and churns is a local industry, along with the processing of dairy products and the manufacture of rayon, silk, and hosiery. The city is the seat of Middle Tennessee State College. Rutherford Hospital is maintained by the county and is headquarters for a child health demonstration unit.

Murfreesboro was founded in 1766. From 1819 to 1825 it was the capital of the state. An important battle of the Civil War was fought here (see STONES RIVER, BATTLE OF). The battlefield is now the Stones River National Military Park. Water, power, and lighting systems are municipally owned. The city is governed by a mayor and council and has a city manager. Pop. (1940) 9,495; (1950) 13,052.

MURGER, mŭr-zhā', Henri, French poet and novelist: b. Paris, March 24, 1822; d. there, Jan. 28, 1861. For a time he was secretary to Count Aleksei K. Tolstoy. Of his career from 1838 to 1847 almost nothing is known. He was a member of an informal group of unconventional and impecunious young artists and authors who called themselves Bohemians, a name famous in general literary history. He contributed much material to numerous periodicals and at last made a reputation by his *Scènes de la vie de bohème*, which appeared serially in *Le Corsair*, 1847-1849, and in book form in 1851. In these sketches the character Rodolphe represents Murger himself. The book was dramatized in 1849 in collaboration with Théodore Barrière and served as the basis of Puccini's opera *La Bohème* (1896). Murger also wrote dramas for the *Revue des Deux Mondes*. Other works are *Scènes de la vie de jeunesse* (1851); *Le Pays Latin* (1851); *Le Dernier*

rendezvous' (1852); and 'Les buveurs d'eau' (1854). Many of his lyrics are very beautiful and have been translated by Andrew Lang in 'Ballads and Lyrics of Old France' (London 1872), and his prose works, especially his masterpiece, are characterized by rare humor and pathos. His general influence, however, was unhealthy, and he personally sank into the depths of dissipation and died in a charity hospital. When a monument was lately erected to his memory there was a considerable amount of protest. Consult the appreciation in Saintsbury's 'Essays on French Novelists' (1891) and that by his fellow Bohemians in 'Les huits d'hiver' (Paris 1862). See BOHEME, LA.

MURGHAB, moor-gāh', a river of central Asia, which rises on the northern frontier of Afghanistan, in the Paropamisus Mountains, and after a northwestward course of nearly 400 miles loses itself in the desert sands surrounding the oasis of Merv.

MURIACITE. Same as ANHYDRITE (q.v.).

MURIATIC ACID. See HYDROCHLORIC ACID.

MURICHI, or **MORICHI**, a South American palm of the genus *Mauritia* (*M. flexuosa*), also known as ita-palm; it is nearly related to the *buriti* (q.v.) or wine-palm. These palms reach a height of 100 to 150 feet and grow along the Orinoco River, forming great forests near its mouth. It furnishes to the Indians of that region almost everything; and during much of the year, when the lowlands adjacent to the river are flooded, they dwell among its branches, like monkeys, for want of dry land upon which to rest or travel. "At the time of the inundations," says Humboldt, "the tufts of the fanleaved murichi present the appearance of a forest issuing from the bosom of the waters. The navigator, traversing at night the branches of the Orinoco delta, sees with surprise the crowns of these palms lighted up by large fires. These are the habitations of the Guaranis suspended from the trunks of the trees. These people stretch mats in the air, fill them with earth and on this bed of wet clay light what fires they require for household purposes. For ages they have owed their liberty and political independence to the treacherous and miry nature of their soil, which they traverse in seasons of drought and over which they alone know how to pass in safety; to their isolation in the delta of the Orinoco, and to their living in the trees." Consult von Humboldt, 'Voyage aux Régions Equinoxiales,' Vol. VIII (1807-27).

MURIDÆ, the family of mice and rats (qq.v.).

MURILLO, mū-rīl'ō (Sp. moo-rēl'yō), **Bartolomé Estéban**, bār-tō'lō-mā ās-tā'bān, Spanish painter: b. Seville, 31 Dec. 1617; d. there, 3 April 1682. He began his art education under Juan del Castillo, and in 1642 sought wider experience in Madrid, where his townsman Velasquez was enjoying a brilliant career. By the latter he was dissuaded from a contemplated visit to Rome and secured facilities for studying in the Royal Galleries and in the Escorial. Here he placed himself for three years under the inspiration of Ribera, Titian, Rubens, Vandyke and Velasquez himself. In 1645 he returned to Seville where he undertook

to paint 11 separate pictures for the cloister of Saint Francis in illustration of Franciscan history. These works proved the foundation of his renown. The principal pieces of this series are 'Saint James Distributing Alms' (now in the Academy Fernando, Madrid); the so-called 'Angel Piece' (in the Louvre); 'The Death of Saint Clara' (in the Dresden Gallery). These strike the note of the early Seville school, being warm in tone, and exhibit Murillo as drawing his types of beauty from the lower orders of the Spanish people. Of even more transparent coloring are his 'Saint Leander and Isidore' in the sacristy of the cathedral at Madrid; 'The Birth of Mary' (in the Louvre); and the 'Vision of Saint Anthony' (in Seville Cathedral, 1656); both of these latter belong to the middle period of his artistic development. In 1665 he began his four pictures for the church of Santa Maria pa Blanca, among them being his 'Church Triumphant'; 'The Immaculate Conception' (in the Louvre); and 'The Foundation of the Church of Santa Maria Maggiore at Rome' (in the Madrid Academy). In 1668 he painted his 'Madonna Hovering in the Clouds Surrounded by Eight Saints of Seville' (in the chapter-house of Seville Cathedral); and about 1670 his 'Holy Family with Elizabeth and The Infant Baptist' (in the Louvre). His most brilliant period was between 1670 and 1680; and in 1674 he had completed the eight vast pictures illustrating the 'Corporal Works of Mercy.' These were intended for the church of the Caridad Hospital, and are remarkable for splendor of coloring and strength of design; the faces are lifelike in expression and the composition and perspective faultless. His 'Saint Elizabeth of Hungary Nursing the Sick' (in the Madrid Museum) belongs to this period. In 1676 he executed 20 pictures for the Capuchin monastery at Seville, 17 of which are now in the local museum. It was at this time he painted the famous 'Immaculate Conception' which Maréchal Soult took to France and sold to the nation for 615,000 francs. It is now in the Louvre, and is the work by which this painter is most popularly known. While Murillo was engaged at Cadiz in painting 'The Betrothal of Saint Catherine' for the high altar of the Capuchin Church, he fell from the scaffolding and died as the result of his injuries. The work was completed by his pupil Osorio with no particular success.

Murillo left about 400 pictures, including his devotional paintings and the many representations of the 'Immaculate Conception,' one of his favorite and characteristic subjects. His most important works in the United States are the altar-piece in the cathedral of Saint Peter's at Cincinnati and 'Gallegas at the Window' in the Widener collection, Philadelphia. He was the greatest of Spanish religious painters because his Madonnas are real Spanish women and only raised by the magic of his brush into sainthood or apotheosis. But he was a great genre painter also. He knew the gypsies and beggars of Spain as well as he knew the saints. He could paint landscape and portrait, flowers and fruit, maidens and children of that Seville which he loved so well and never left for France or Italy. Unswayed by the influence of the dazzling schools of Tuscany or Flanders

he has confined himself to Spanish faces, to Spanish atmosphere and scenery, and has realized a manner and color of his own. If he sacrificed in this way anything of vigor or variety he gained far more in originality, sincerity, verisimilitude and an individuality which is truly national.

Consult Calvert, A. F., 'Murillo, a biography and appreciation' (New York 1907); Hurll, E. M., 'Murillo' (Boston 1901); Tubino, F. M., 'Murillo, su epoca, su vida, sus quadros' (Seville 1864); Lefort, P., 'Murillo et ses élèves' (Paris 1892).

MURLIN, Lemuel Herbert, American clergyman: b. Mercer County, Ohio, 16 Nov. 1861. He was graduated (1891) at De Pauw University and studied (1896) at the University of Pennsylvania and (1897) at Clark University, then in Europe (1898). He received the degree B.D. at Garrett Biblical Institute (1899). He was teacher at the public schools and in Fort Wayne College (1877-86), pastor of churches in Fort Wayne, Knightsville and Vincennes, Ind. (1886-94). From 1894-1911 he was president of Baker University, Baldwin, Kan., and president of Boston, Mass., University from 1911 to 1925. He was (1925-28) president of De Pauw University. During 1909 and 1911 he was acting pastor of the American Church at Berlin and pastor 1928-29; member of the General Conferences of the Methodist Episcopal Church in 1900, 1904 and 1916 and of the Ecumenical Conferences at London (1901), Toronto (1911) and London (1921). He is a member and officer in many educational associations and was chairman of the Governor's Commission of Higher Education in Massachusetts.

MURMAN COAST, the Arctic coast of North Russia, between Norway and the White Sea, forming the northeastern part of the Kola Peninsula. The western part is deeply indented; the eastern more regular. The town of Alexandrovsk or Murmansk, with an ice-free harbor, became a considerable community during the World War. It was connected with Petrograd by a railway, and was used as a resort by refugees from Russia and Finland. When Russia ceased to become an active participant in the war on the side of the Allies, Archangel was abandoned as a port for unloading provisions and war materials, and the Murman Coast was utilized for that purpose. With the spreading anarchy, promoted by the Soviet Government, and the German encroachments on Russian territory in 1917 and 1918, Alexandrovsk became an important port. In July, 1918, a British expedition was sent to the Murman Coast to prevent the Germans then in Finland from using it as a submarine base. It remained until September, 1919. During the last months of the war the Germans planned, with their supporters in Finland, to send an important expedition against this coast. The Armistice intervened before the initial steps could be taken. In the absence of an effective government in Russia the isolated position of Alexandrovsk and its long distance from the centres of turmoil enabled the Allies to keep unofficially in touch with the country. In 1919 the Soviet Government gained control of the coast and organized it as a part of the Soviet Republic.

MURNER, moor'nēr, Thomas, German satirist and opponent of the Reformation: b.

Strassburg, 24 Dec. 1475; d. about 1536. He studied at the principal universities of Europe, devoting himself particularly to theology and philosophy, and early gained a reputation for ability, marred however by a quarrelsome disposition. He led an unsteady life, preaching for some time at Frankfurt-on-the-Main and other places, but incurring generally the displeasure of his congregations by the coarse personalities of his sermons, and was successively expelled from Freiburg, Treve and Venice. He became one of the most virulent opponents of the Reformation. Some of his writings against the Reformation were burned by order of the Diet of Worms; and he was compelled to flee to Switzerland, whence he was in time likewise expelled. The latter part of his history is not known. In 1506 he had been crowned as poet laureate by the Emperor Maximilian; and his 'Narrenbeschwörung' (1512), of which his 'Der Schelmenzunft' (1516) may be regarded as a continuation, is one of the most remarkable imitations of Sebastian Brant's celebrated satirical poem entitled 'Narrenschiff.' He wrote 'Chartiludium logice,' etc. (1507), and other Latin works; prepared a German version of Virgil and other translations; and was also regarded as the editor of 'Eulenspiegel.' But he is chiefly remembered by his writings against Luther and the Reformation. His most celebrated satirical work is entitled 'Von dem grossen Lutherischen Narren' (1522; new ed., 1848). Consult Goedeke, 'Murners Narrenbeschwörung' (1879); Kawerau, 'Thomas Murner und die Kirche des Mittelalters' (1890); Lappenburg, 'Murners Eulenspiegel' (1854); Ries, W., 'Quellenstudien zu Murners satirisch-didaktischen Dichtungen' (Berlin 1890); Schatz, H., 'Stimmungen und Effekte in Murners Dichtungen' (Kiel 1909).

MUROM, moo'ròm, Russia, town in the province of Vladimir, located on the Oka and Kovrov-Murom Railway. It has a cathedral, theatre, city bank, high school, etc. Among its industries are large linen weaving factories and trade in grain. This was a very important trading town in the 10th century. Its population is about 22,000.

MURPHEY, Archibald De Bow, American jurist: b. Caswell County, N. C., 1777; d. Hillsboro, N. C., 3 Feb. 1832. He was graduated from the University of North Carolina in 1799 and was for the three succeeding years professor of ancient languages there. He studied law and was admitted to the bar in 1802 and established a large practice. He was a member of the State senate in 1812-18 and proved himself an able legislator, advocating internal improvements and working earnestly to enlarge and improve the educational system of the State. In 1818 he was a judge of the Superior Court and in 1819-20 was a justice of the Supreme Court of North Carolina. He published 'Memoir of Improvements Contemplated and the Resources and Finances of the State' (1819); 'Reports of Cases in the Supreme Court of North Carolina in 1804-13 and 1818-19' (1821-26), etc.

MURPHY, Arthur, British dramatist: b. Clooniquin, near Elpin, County Roscommon, Ireland, 27 Dec. 1727; d. 18 June 1805. He was educated at the Roman Catholic College of

Saint Omer, France, and was subsequently employed in a London banking house. His first drama, which appeared in 1756, was entitled *The Apprentice*. In 1758 appeared *The Upholsterer*, a farce directed against politicians, which proved very successful, followed by *The Orphan of China*; *The Way to Keep Him*; *All in the Wrong*; *The Citizen*; *The Old Maid*; *Three Weeks after Marriage*; *Zenobia*; *The Grecian Daughter*, etc. At various times in his life he engaged in political controversies, and edited journals opposing Mr. Fox, the first Lord Holland and Wilkes' *North Briton*. He also edited the works of Fielding, wrote an essay on Dr. Johnson, translated Tacitus, and wrote a *Life of Garrick*. His plays are his best performances, and some of them, including *The Way to Keep Him* and *Three Weeks after Marriage*, long kept the stage.

MURPHY, Charles Francis, American politician: b. New York, June 20, 1858; d. there April 25, 1924. He received a public school education, and soon became interested in politics. As organizer and member of the Sylvian Club and through his fame as an athlete he gained a wide personal acquaintance. He opened a series of saloons which he held to be practically poor men's clubs. He showed decided talents as a political organizer and in 1891 became the Tammany leader of his assembly district. In 1897-1901 he was a commissioner of docks and ferries in New York, served for a time as chairman of Tammany Hall and on the retirement of Richard Croker in 1902 succeeded him as chief. In 1903 and 1905 he led his party to victory in the mayoralty campaigns, which elected George B. McClellan as mayor. In 1904 Murphy opposed the nomination of Alton B. Parker for the presidency and in 1906 supported William R. Hearst for governor, the latter's defeat being regarded as a severe defeat for Murphy. In 1909 the Tammany Hall nominee for mayor, W. J. Gaynor, was the only successful candidate on the Democratic ticket, the Fusionists having captured the remaining offices. Many thought that this reverse would compel Murphy's retirement, but to the despair of the political prophets he continued as chief. In 1910 the election of John A. Dix to the governorship was supposed to be due to Murphy's influence with the upstate Democrats and that as a result his power had become paramount in the Democratic Party throughout the state. The succeeding years brought sharp criticism to Tammany and its leader because of several scandals regarding highway and canal contracts. Boss rule now became a state issue and his opponents held up Murphy as an example of everything vicious in the boss system. This, however, came with a bad grace from Republicans, themselves the most notorious upholders of the system. In 1912 Murphy supported Wilson after the nomination of the latter although he favored Harmon and Clark in the early stages of the convention. He was a presidential elector the same year. In state politics it appears that Murphy took little part in the nomination of Sulzer; friction developed after election and Tammany was by many believed to have been the real factor in the impeachment and removal of Sulzer in 1913. The mayoralty campaign of 1913, in which Edward E. McCall was the Tammany nominee, was exceedingly bitter, and Murphy was violently

assailed by the Fusionists. In 1917 the Tammany candidate for mayor, Judge Hylan, was elected by a great majority and Murphy's leadership continued unimpaired. Mr. Murphy's philanthropies were extensive, but this side of his character was known to few persons.

MURPHY, Frank, American lawyer, public official, and United States Supreme Court justice: b. Harbor Beach, Mich., April 13, 1890; d. Detroit, Mich., July 19, 1949. Devout Irish parents destined him for the church, and when he failed to enter the priesthood of the church, they ordained him, he said, to the "social priesthood." While in high school and afterwards at the University of Michigan, he worked during vacations on his father's farm and in a starch factory. In the campaign of 1912, two years before his graduation from law school, Mr. Murphy made speeches for Woodrow Wilson. After getting his degree he worked as a law clerk at \$13 a week and taught English to foreigners at night for \$2 a lesson. In the First World War he was a captain of infantry in France and in the Army of Occupation in Germany.

After the war Mr. Murphy did graduate study in law at Lincoln's Inn, London and at Trinity College, Dublin. When he went back to Detroit to practice, his first important case was one against two army officers and a civilian, in which he was assistant United States attorney. The defendants went to prison. In 1922 he was elected a judge of Detroit's Recorder's Court and created a "sentencing board" consisting of himself, a psychiatrist and a probation officer. He was elected mayor of Detroit in 1930, after a campaign in which the city administration was charged with corruption. In 1931 he was re-elected and faced the problem of feeding thousands of men made jobless by the closing of the automobile plants. He was widely criticized for the cost of the relief given and pioneered for work relief as a federal function, being one of the first advocates of the WPA.

In 1933, President Roosevelt appointed Mr. Murphy governor general of the Philippines, and he remained as high commissioner after the islands were given commonwealth status, until 1936, when he was called home to become the Democratic candidate for governor of Michigan. He was elected and was almost immediately faced with grave labor problems in the form of sit-down strikes in some of the automobile plants. He refused the request of some industrialists to call on the state militia to oust strikers from plants, because, he said, he believed the use of troops would lead to bloodshed. He was severely criticized in certain quarters, and in 1938 was decisively defeated for re-election. President Roosevelt then appointed him attorney general of the United States, and he qualified Jan. 1, 1939. In January 1940 the president appointed him to the United States Supreme Court to succeed the late Justice Pierce Butler, and the Senate confirmed his appointment Jan. 17, 1940. During a 4-months' leave in 1942 he served as a lieutenant colonel in the United States Army. In January 1944 he was appointed chairman of a committee to fight "Nazi persecution and extermination of the Jews." A year later the *American Hebrew Magazine* awarded him a medal as "one of the foremost exponents . . . of the fight against anti-Semitism."

MURPHY, Franklin, American manufacturer and politician: b. Jersey City, N. J., Jan. 3, 1846; d. Newark, N. J., Feb. 24, 1920. His family moved from Jersey City to Newark where he attended the Newark Academy until he was 16. Enlisting in the Federal army in 1862, he took part in 19 battles and left the army as a first lieutenant in 1865. At the close of the war he established at Newark a varnish business which has since become widely known.

Murphy began his political career in the early 1880's, occupying various minor city and state offices until 1901, when he was elected governor of New Jersey for three years. His term as governor was noted for the passage of the first state primary law (not the open primary as invented later), improvement in the child labor laws, and general improvement in labor legislation.

MURPHY, John Benjamin, American surgeon: b. near Appleton, Wisconsin, Dec. 21, 1857; d. Mackinac Island, Michigan, Aug. 11, 1916. He was graduated from Rush Medical College in 1879 and spent from 1882 to 1884 in graduate study at the universities of Vienna, Munich, Berlin, and Heidelberg. Entering practice in Chicago, he soon became known for his achievements in surgery. One of the operations he performed which was of interest to his colleagues was the making of a new jaw from metal and silver wire. In 1892 he devised a metal ball, known as the Murphy button, used for fastening the ends of intestines after a piece had been removed. This was his most outstanding contribution to surgery. As a teacher of clinical surgery, however, he was preeminent. His clinics were of the greatest interest to other surgeons.

MURPHY, John Francis, American painter: b. Oswego, N. Y., Dec. 11, 1853; d. New York, Jan. 30, 1921. With little schooling and artistically self-taught, he opened a studio in New York City in 1875. His first picture to appear in the National Academy of Design was exhibited in 1876, and in 1887 he was elected to the National Academy. His paintings, many of which hang in leading American galleries, are chiefly landscapes. His *Tints of a Vanished Past* won the Haligarten Prize in 1885. Two years later he was awarded the Webb Prize by the Society of American Artists, of which he was a member. In 1910 he was awarded the Inness Medal.

MURPHY, William Parry, American physician: b. Stoughton, Wis., Feb. 6, 1892. He received his undergraduate training from the University of Oregon, his degree in medicine from Harvard University in 1920, and for several years was on the staff of the Peter Bent Brigham Hospital in Boston. He is noted for his research work on diabetes and diseases of the blood. In 1934 he received the Nobel Prize in Physiology and Medicine, along with George H. Whipple and George R. Minot, for his discovery of the liver treatment for pernicious anemia. He is the author of *Anemia in Practice; Pernicious Anemia* (1939).

MURPHYSBORO, mûr'fiz-bûr-ô, city, Illinois, seat of Jackson County, 24 miles west of Marion on the Big Muddy River, and the Illinois Central, the Missouri Pacific, and the Gulf, Mo-

bile, and Ohio railroads. Situated at an altitude of 420 feet in an agricultural area, it has a large trade in farm and dairy products, and also coal and lumber. It mills flour, refines silica from nearby deposits, and makes shoes, dresses, and beer. It has a public library and a general hospital.

Murphysboro is the birthplace of Gen. John Alexander Logan, the American Civil War soldier and legislator who was the candidate for vice president of the United States on the James Gillespie Blaine ticket in 1884.

Founded in 1843, it was incorporated in 1867. Municipal government is administered by a mayor and council. Pop. (1950) 9,241.

MURRAIN, mûr'in, any widely prevailing and contagious disease among domestic animals. The term is applied to various specific disorders in different localities, but more particularly to the epizootic diseases, especially those of cattle. Still more strictly it is limited to the plague commonly known as the foot-and-mouth disease (aphthous fever), which attacks cattle and other animals, causing loss of appetite, febrile disturbance, lameness, and vesicular eruptions on the feet and in the mouth, with frequent complications.

MURRAY, EARL OF, English spelling of Scottish title MORAY. See STUART—James Stewart (1499?–1544).

MURRAY, Alexander Stuart, British archaeologist: b. near Arbroath, Scotland, Jan. 8, 1841; d. London, March 5, 1904. In 1864 he was graduated with an M.A. from the University of Edinburgh and in the following year continued his philological and archaeological studies in Berlin. Two years later he became an assistant in the department of Greek and Roman antiquities at the British Museum, and in 1886 succeeded to the occupation for which he was best known, that of keeper of the museum's department of Greek and Roman antiquities.

MURRAY, George Henry, Canadian politician: b. Grand Narrows, Nova Scotia, June 7, 1861; d. Montreal, Jan. 9, 1929. He was educated in Grand Narrows and in Boston University and was admitted to the bar in 1883. He was appointed to the legislative council of Nova Scotia in 1889, but resigned in 1891, and in the same year became a member of the provincial cabinet without portfolio, under the Hon. W. S. Fielding, and in 1896 became premier and provincial secretary of Nova Scotia under a Liberal administration. He was elected to the Dominion Parliament in 1897 and remained at the head of the Nova Scotian government until his resignation in 1923.

MURRAY, Gilbert (full name GEORGE GILBERT AIMÉ MURRAY), British classical scholar: b. Sydney, New South Wales, Jan. 2, 1866. The son of the President of the Legislative Council of New South Wales, in 1877 he came to England where he studied at the Merchant Taylors' School in London and then at St. John's College, Oxford. In 1888 he was made a fellow of New College, Oxford, and in 1889, the year in which he married Lady Mary Howard, daughter of the 9th earl of Carlyle, he accepted the professorship of Greek at Glasgow University, which position

he held until 1899. Although he is noted for his English translations of Greek dramatic works, two original plays, *Carlyon Sahib* (1899) and *Andromache* (1900) were both published and performed. From 1908 to 1936 he was regius professor of Greek at Oxford.

Professor Murray's career as a scholar has been paralleled by his lifelong concern with the problems of world peace and international cooperation. After World War I he was a member of the committee which drafted the covenant of the League of Nations and was one of the promoters of the League of Nations Union on which he sat as chairman from 1918 to 1919 and from 1923 to 1938. His many writings dealing with international problems include *Liberalism and the Empire* (1900), of which he was part author; *The Foreign Policy of Sir Edward Grey* (1915); *Faith, War, and Policy* (1918); *The Problem of Foreign Policy* (1921); *The Ordeal of This Generation* (1929); *Liberalism and Civilization* (1938); and *From the League to the U.N.* (1947).

In the field of classical scholarship, Murray is best known for his critical editions of Euripides and Aeschylus and his translations of the plays of Euripides into English verse. The latter in particular represent a noteworthy attempt to render the essential rhythmic quality of Greek poetry in English rhymed heroics instead of the more customary blank verse. Several of these translations have been performed in England and America. He also translated plays of Aeschylus, Sophocles, Aristophanes, and Menander. Among his published studies in the culture of ancient Greece may be mentioned the *History of Ancient Greek Literature* (1897); *The Rise of Greek Epic* (1907); *Euripides and His Age* (1913); *Five Stages of Greek Religion* (1925); *Aristophanes* (1933); and *Greek Studies* (1946).

In 1936, his 70th birthday was honored by two publications dedicated to him by colleagues and former students—*Greek Poetry and Life: Essays Presented to Gilbert Murray on his 70th Birthday*, by C. Bailer and others and a collection of *Essays in Honour of Gilbert Murray*, by H. A. L. Fisher and S. de Madariaga. Five years later he was invested with the Order of Merit. Deeply sensitive to the forces which led to the breakdown of the Victorian "cosmos," Murray represents one of those rare persons whose study of the past impels him toward the problems of the present and future; for the Greek genius, which he described as "the spirit that in any trouble thinks and is patient, that saves and not destroys," is strikingly reflected in his efforts to find the groundwork for world peace in a century of world wars.

MURRAY, Grenville (full name EUSTACE CLARE GRENVILLE MURRAY), English journalist: b. 1824; d. Passy, France, Dec. 20, 1881. A natural son of Richard Grenville, second Duke of Buckingham, he was in the diplomatic service from 1851 to 1868, but was guilty of irregular practices, and was generally in discord with his superiors or with British residents. From 1869 he lived in France, where he was Paris correspondent of the *Pall Mall Gazette* and the *Daily News*, and an early contributor to the *Cornhill*.

Murray was one of the ablest journalists of his time and the initiator of "yellow" methods in English newspapers, being horsewhipped by Lord

Carrington in 1869 for a libel that appeared in *The Queen's Messenger*, a paper he conducted. As the Comte de Rethel d'Aragon, he lived in Paris, using the title of his wife, a Spanish woman. He was a voluminous writer, and his works included *The Roving Englishman*, chapters of travel (1854); *Embassies and Foreign Courts* (1855); *The Member for Paris* (1871); *Young Brown* (1874); *Turkey* (1877); *The Russians of To-Day* (1878); *Under the Lens: Social Photographs* (1885).

MURRAY, James, Scottish soldier: b. about 1721; d. near Battle, Sussex, June 18, 1794. He was a son of the fourth Lord Elibank, and about 1740 entered the army. Coming with his regiment to America in 1757 he commanded a brigade at the siege of Louisburg (1758), and in the battle on the Heights of Abraham (Sept. 13, 1759) led the left wing of the army under Wolfe. In 1760 he held Quebec against superior numbers of the French, in the same year served with Amherst in the reduction of Montreal and was made governor of Quebec.

From 1763 to 1766 Murray was governor of Canada and in 1774 became governor of Minorca. He was compelled to surrender Fort Saint Philip to the French in 1782 after a heavy siege, and upon returning to England was court-martialed but acquitted.

MURRAY, SIR James Augustus Henry, Scottish philologist and lexicographer: b. Denholm, near Hawick, Roxburghshire, Feb. 7, 1837; d. Oxford, July 26, 1915. Graduated from London University, he was an assistant master in Hawick Grammar School from 1855 to 1858, becoming in the latter year master of Hawick Academy. For a few years he was foreign correspondent to the Oriental Bank in London, and from 1870 until his removal to Oxford in 1885, a master at Mill Hill School.

During this time Murray became well known as a philologist, serving as president of the Philological Society in 1878-1880 and 1882-1884. His life's work, however, was embodied in the *New English Dictionary on Historical Principles*, issued under the auspices of the Philological Society from the Clarendon Press, Oxford. It was he who was largely responsible for the revival of the original project of the Society for a comprehensive historical dictionary, and, under his general editorship which he assumed in 1879, this monumental undertaking was all but complete in his lifetime. He was assisted by a staff of from 20 to 30 editors, and thousands of volunteer assistants, who read every English book published before 1500 A.D. and the principal books since that date, thus obtaining many millions of illustrative references for use in the work. He had almost completed the tenth and last volume T to Z, when he died. His aims in connection with this vast undertaking are embodied in an address to the Philological Society in 1879.

Other works by Murray are *A Week among the Antiquities of Orkney* (1861); *Dialects of the Southern Counties of Scotland* (1873); *Synopsis of Paley's Horae Paulinae* (1872); *The Romance and Prophecies of Thomas of Erceldoune* (1875).

MURRAY, John, American clergyman, founder of American Universalism: b. Alto Hampshire, England, Dec. 10, 1741; d. Boston

Mass., Sept. 3, 1815. He was brought up in Ireland, where he joined the Methodist congregation and did some preaching, but in 1760 went to England, came under the influence of James Rely and was excommunicated by George Whitefield. Coming to America in 1770 he preached in Newport, Boston and Portsmouth doctrines, which agree with modern Universalism only in the belief of universal salvation, but otherwise held to the dogma of the Trinity, of personal devil and of the incarnation. At the outbreak of the Revolution he was chaplain of a Rhode Island brigade for a short time, during which his resignation was demanded by the orthodox chaplains in the army.

Murray formed a Universalist church in Gloucester, and in 1783 recovered property belonging to his parishioners which had been seized by the parish authorities, who acted on the ground that the Universalists had no corporate existence; the success of this suit was a distinct advance in congregational freedom in New England. He wrote *Letters and Sketches* (1812) and an *Autobiography*, continued and edited by his wife (1816).

MURRAY, John, the name of several successive generations of proprietors of a London publishing house. The founder was JOHN MACMURRAY (1745-1793), a descendant of the Murcays of Athol, who commenced business as a publisher in London in 1768, dropping the prefix to his name.

His son JOHN MURRAY (Nov. 27, 1778-June 2, 1843) began business in 1799, early attained success and became the friend of, as well as publisher for, some of the chief writers of the day including Byron, Moore, Rogers, Campbell, Crabbe, Washington Irving, George Borrow and Benjamin Disraeli. He started the *Quarterly Review* in February 1809 in opposition to the *Edinburgh Review*, of which Gifford, S. T. Coleridge and Lockhart were editors, and Scott and Southey contributors. By 1817 the *Quarterly* was a great success.

In 1824 Murray was involved in the controversy with Moore regarding the destruction of Byron's *Memoirs*; and in 1826 undertook the publication of the *Representative*, a daily newspaper, which, after running six months, was discontinued.

The succeeding JOHN MURRAY (April 1, 1808-April 2, 1892) was the projector of the famous series of guidebooks that bears the firm's name. He carried on the *Quarterly Review*, begun by his father, and in 1887 began *Murray's Magazine*, which ran until 1891. Darwin's *Origin of Species* was published by his firm in 1859.

SIR JOHN MURRAY (Dec. 18, 1851-Nov. 30, 1928) continued as head of the family firm and edited the *Correspondence* of Byron in 1922. He was succeeded by his son SIR JOHN MURRAY (b. June 12, 1884), who in 1952 still maintained the family connection with the firm.

MURRAY, Sir John, British marine zoologist and oceanographer: b. Coburg, Ontario, March 3, 1841; d. Kirkliston, near Edinburgh, March 16, 1914. Educated at Edinburgh University, in 1867 he accompanied for biological purposes an expedition to Spitzbergen and Greenland, and from 1871 to 1876 he served under Sir John Thomson as one of the scientific staff of the *Challenger* expedition. From 1876 till 1882

he was chief assistant editor of the scientific reports published in connection with that voyage, and in the latter year became editor-in-chief, liberally supporting the work out of his own means. He made bathymetrical surveys of the freshwater lochs of Scotland in 1897 and explored the North Atlantic in 1910, the results of the latter exploration being published in *The Depths of the Sea* (1912).

MURRAY, John Clark, Canadian educator: b. Paisley, Scotland, March 19, 1836; d. Montreal, Nov. 20, 1917. He was educated in the universities of Edinburgh and Göttingen, and in 1862 accepted the chair of philosophy in Queen's University, Kingston, Canada. From 1892 he was professor of moral philosophy in McGill University, Montreal. He published *Outlines of Sir William Hamilton's Philosophy* (1870); *The Ballads and Songs of Scotland* (1874); *A Handbook of Psychology* (1885); *An Introduction to Ethics* (1901).

MURRAY, Lindley, American grammarian: b. Swatara, Lancaster County, Pa., April 22, 1745; d. Holgate, near York, England, Jan. 16, 1826. Desiring a literary career against his father's wishes, he compromised on the study of law and practiced as a barrister. After the Revolution he quitted the bar for a commercial speculation, and having realized a fortune, went in 1784 to England for reasons of health, and settled at Holgate, near York. His first publication was *The Power of Religion on the Mind* in 1787.

Murray's *English Grammar* met with an enormous success, being almost universally introduced as a textbook in England and the United States, and for years was regarded as the standard authority. It passed through nearly 50 editions in its original form. A corrected edition by the author was published in 1816, and his abridgment (1818) of this went through 150 editions, each of 10,000 copies. His work was far from accurate, however, and was soon superseded; but it helped to promote the systematic study of grammar.

Among Murray's other writings were *English Exercises* and *English Reader* (1799), and a *Spelling Book* (1804), which went through 44 editions. He was also a botanist and his gardens were renowned.

Consult Murray, Lindley, *Memoirs of the Life and Writings of Lindley Murray*, preface and continuation by Elisabeth Frank (Philadelphia 1827).

MURRAY or MORAY, Sir Robert, Scottish statesman: b. around 1600; d. London, July 4, 1673. He was educated at the University of St. Andrews in France and was honored by the favor of Cardinal Richelieu. Knighted in England in 1643, he returned to France where he fought with his regiment of Scots guards in Germany. As the secret envoy entrusted with the treaty negotiations between Scotland and France, he planned the escape of Charles I from Newcastle, of which plan, however, Charles did not avail himself. After the Restoration he became the lord of the exchequer for Scotland as well as deputy secretary in June 1663, and from then until 1670, he, the duke of Lauderdale, and the king ruled Scotland.

Murray was one of the founders of the Royal Society, the oldest scientific society in Great Britain, founded in 1660. He presided at its

meetings for over a year and made numerous reports on points connected with geology and natural history.

MURRAY, William (1ST EARL OF MANSFIELD), British judge and parliamentary leader: b. Abbey of Scone, March 2, 1704-1705; d. Highgate, London, March 20, 1793. Inheriting from his Jacobite parents a strong sympathy for the royal prerogative, he attended Christ Church, Oxford, where he developed a remarkable declamatory talent. After his graduation in 1727, he began a lifelong rivalry with William Pitt by defeating him in a competition for the best Latin poem on the death of George I. His success at the bar was rapid; he became solicitor general in 1742; attorney general in 1754, privy councilor in 1756; and in the same year was sworn in as lord chief justice of the Kings Bench and created baron Mansfield of Mansfield. In 1876 he became earl of Mansfield.

Often unpopular for his judgments, Murray was bitterly attacked in Junius' *Letter to the King*. During the Gordon riots of 1780 his house was burned and a year earlier he had proposed a coalition of all parties to control the American rebellion. Although his name is not associated with any outstanding statutory contributions, he was an able judge and, in a case before the Kings Bench in 1771, he was outspoken against the institution of slavery.

MURRAY, city, Kentucky, seat of Calloway County, 37 miles south-southeast of Paducah on the East Fork of the Clarks River, served by state highways and the Nashville, Chattanooga, and St. Louis Railroad. It is located at an altitude of 475 feet in an agricultural region, producing dark tobacco, corn, clover, and livestock. Among its varied manufactures are tobacco, dairy and concrete products, pottery, lumber, and hosiery. It also has feed and flour mills. Nearby is Kentucky Lake, which provides recreational facilities for boating, fishing, and camping. The city has an airport, two hospitals, and is the seat of Murray State Teachers College, founded in 1923.

Murray's most famous son was the inventor Nathan B. Stubblefield (1866-1928), whose early experiments in the technique of radio broadcasting have earned him the reputation of being a precursor of Marconi. Incorporated in 1844, the community was named for John L. Murray, who was congressman from this district around 1830. Municipal government is administered by a mayor and council. Pop. (1950) 6,035.

MURRAY, city, Utah, in Salt Lake County, just south of Salt Lake City on the Jordan River near Wasatch Range, and served by the Denver and Rio Grande Western and the Union Pacific railroads. Situated at an altitude of 4,350 feet, it is a smelting town, with lead mining nearby, and serves as a trading center for an agricultural area producing sugar beets, alfalfa, and potatoes. Among its manufactures are canned foods, flour, textiles, and lumber.

Murray was incorporated in 1902 and has a commission form of government. Pop. (1950) 9,006.

MURRAY, river, Australia, rising in the Australian Alps, its sources being partly in New South Wales, partly in Victoria. It flows for a

long distance westward, forming the boundary between these two colonies, then passes into South Australia, where it takes a southern direction and falls into the Indian Ocean at Encounter Bay, 39 miles southeast of Adelaide, after passing through a large shallow sheet of water called Lake Alexandrina. Its total length is about 1,300 miles. Its chief affluents are the Murrumbidgee and Darling. It is navigable by light draft steamers in the wet season for the greater part of its course to Albury, 190 miles northeast of Melbourne.

MURRAY STATE COLLEGE, a coeducational institution in Murray, Kentucky. It was founded in 1923 by Dr. Rainey T. Wells and is located on a 60-acre campus, having modern dormitories and classrooms, veterans housing units, and the largest college auditorium in Kentucky. It offers the degrees of Bachelor of Arts and Bachelor of Science, and a B.S. in Home Economics, B.S. in Agriculture, Bachelor of Music Education, Bachelor of Music, and M.A. in Education.

The yearly enrollment averages about 1,500 students.

MURRE, mûr, an auk (q.v.) of the genera *Uria cephus*, and related groups; a guillemot. They are small, black-and-white, web-footed diving, fish-eating birds, which abound on all rocky northern coasts, breeding on sea-fronted ledges, where each pair produces a single, large pyriform, variously colored egg, which is not placed in a nest but incubated in turn by the parents, who lift it from the ground upon their webbed toes and warm it between their downy legs.

MURRHINE VASES are antique vessels, distinguished for costliness of material and beauty of execution. They were brought by Pompey from Asia to Rome, and bore an immense price. Some antiquarians have supposed them to have been made of a mineral of the class of sardonyx or agate, or of a kind of porcelain or glass.

MURRUMBIDGEE, mûr-ûm-bîj'ê, a large river of New South Wales, Australia, rising in the Gourock Range above Numeralla, about 40 miles from the Pacific Ocean. It flows at first northward, but the greater part of its course is westerly; and after receiving the Lachlan from the north, near Nap Nap, it turns toward the south to join the Murray below Balranald. About 1,000 miles long, it is navigable only in the wet season for 500 miles by light-draft steamers.

MURSHIDABAD, moor-shî-dâ-bâd', town, India, in the Presidency division of West Bengal, 116 miles north of Calcutta, on the Bhagirathi, a branch of the Ganges. It is a straggling collection chiefly of mud houses occupying an extensive area, but has several substantial brick buildings, chief of which are the beautiful Nawab's palace dating from 1837, the imambara and a Moslem mosque. Two miles south of the city is Motijhil or Pearl Lake and the site of the historic palace of Suraj-ud-Dowlah. On the opposite bank of the river connected by a ferry is Azimaganj containing the old cemetery of the Nawabs, a mausoleum, and a mosque. The city is noted for its ivory carving, its embroidery in gold and silver lace, silk weaving, and

the manufacture of hookah pipes and musical instruments. It is still a busy centre of trade but less so than during the 18th century when it was the capital of Bengal and a very populous city, the rise of Calcutta causing its decline. Pop. about 10,000; district, about 1,500,000.

MUSA, Ibn Nusair, moo'sa ib'n noo-sir', Arabian general: b. 640 A.D.; d. 716 or 717. He became (704) governor of North Africa which he conquered in its entirety as far as the ocean between 706-709. He sent (711) Tarik to Spain but the expedition was so successful he became jealous of his assistant officers and hindered the expedition while he started himself (712) with an army which carried everything before it. He was recalled and had a most brilliant triumphal procession through Africa to Damascus, where the caliph, Suleiman, accused him of great embezzlements, deprived him of his command, and he was either condemned to pay a heavy money indemnity, or, as other writers say, was put to death. Consult Burke, 'History of Spain' (Vol. I, 1895); 'Cambridge Medieval History' (Vol. II, New York 1913).

MUSACEÆ, the banana family, a group in the Order *Scitamineæ*, comprising the largest of herbaceous plants, generally destitute or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivaling palms in stateliness, the long sheathing bases of the leafstalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the mid-rib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a three-valved capsule or fleshy. The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, while the fibres of the leaves are employed for cordage and for textile purposes. See BANANA; FIBRE.

MUSÆUS, mū-sē'ūs, in Greek mythology, a poet, seer and priest, said to have been the son of Eumolpus and Selene, or, according to others, the son and pupil of Orpheus. He was the reputed author of a number of poems, oracles, purificatory verses, hymns, etc., of which we possess but a few fragments, and those of doubtful authenticity. A later Musæus, who flourished about the end of the 5th century A.D., was the author of a beautiful little poem in Greek, entitled 'Hero and Leander.' See HERO; HERO AND LEANDER.

MUSCARDINE. The common European dormouse (q.v.).

MUSCARINE, a coal tar color introduced by Durand and Hugenin, and having the empirical formula $C_{14}H_{10}N_2O_2Cl$. It is a brownish violet powder, slightly soluble in cold water, but dissolving readily in hot water with the formation of a violet-blue solution. Powdered zinc decolorizes its aqueous solution, but the color returns on exposure to air. Muscarine produces a blue color upon cotton that has been mordanted with tannin and tartar emetic.

MUSCARINE, an alkaloid having the chemical formula $C_8H_{10}NO_2$, and occurring in certain mushrooms, notably in the "fly agaric" (*Agaricus muscarius*). It is also formed in

the putrefactive decay of flesh. It may be obtained in the form of deliquescent crystals which are without taste, and insoluble in ether, though readily soluble in water and in alcohol. Solutions of the alkaloid are strongly alkaline, and precipitate ferric and cupric salts in the form of hydrates. Muscarine is exceedingly poisonous. It contracts the pupil of the eye, slows the pulse by prolonging the diastolic state of the heart, and induces salivation, vomiting, intestinal spasms and general muscular weakness, followed by death. Atropine acts as an antidote to muscarine by producing antagonistic physiological processes. The "fly agaric" takes its name from the fact that flies that alight upon it are killed, either by the muscarine or by another alkaloid, neurine, which the fungus also contains.

MUSCAT, müs-kät', **MUSKAT**, or **MASKAT**, Arabia, the capital of Oman, on the Gulf of Oman, commanding the entrance to the Persian Gulf. It is a fortified seaport of considerable commercial and strategical importance; the seat of the Imam or Sultan of Muscat; by arrangement it has a British political resident and since 1898 is used as a coaling station by France. Its appearance by no means corresponds with its wealth and importance. Large buildings are few, and the sultan's palace (a plain edifice), the governor's house, and a few minarets, alone rise above the mass of flat-roofed huts or houses. The streets are extremely narrow and its situation at the foot of high cliffs, and nearly surrounded by bare rocks, renders it one of the hottest places in the world. A sufficient supply of water is obtained from wells about 40 feet deep. About three miles distant is the town of Matrah with docks for building and repairing shipping. As it stands in an open plain, exposed to the sea-breeze, it is cooler than Muscat, so that many of the wealthier merchants of the latter place have their dwellings at Matrah, and spend only the hours of business in the neighboring city. The combined population of Muscat, Matrah and intervening villages has been variously estimated at 25,000 and at 60,000.

Muscat was occupied by the Portuguese under Albuquerque in 1507. In 1651 it fell again under a Mohammedan ruler. In the latter half of the 18th century it attained, under a ruler who bore the religious title of Imam, considerable importance as a seaport. In 1808 Seid Saïd succeeded to the sovereignty, having assassinated his cousin, Bedr. His sovereignty embraced also a stretch on the east coast of Africa, extending from the neighborhood of Cape Delgado northward as far as the equator. In like manner a large portion of the coast of the Persian Gulf acknowledged his sway, so that, including Oman and the African islands Zanzibar, Monfia or Mafia, and Pemba, the coasts ruled by him, for the most part only commercially, could not have had an extent of less than 3,000 miles. In 1840 Seid Saïd removed the court and seat of government from Muscat to Zanzibar, and in 1856 died on the return voyage from the former place. His son Meïed succeeded him as Sultan of Zanzibar and ruler of the African territory, and another son acquired Muscat. Seyyid Turki became ruler of Muscat in 1871, and on his death in 1888 a son succeeded him.

MUSCAT AND OMAN, sultanate. See OMAN.

MUSCATATUCK, mŭs-kā-tŭt-ŭk', river, Indiana, formed in western part of Jefferson County by the junction of Graham and Big creeks and flows 50 miles southwest and west to the eastern fork of the White River, three miles south of Medora, Indiana.

MUSCATEL, mŭs-kā-tĕl'; mŭs'kā-tĕl, a sweet wine, is made of muscat grapes, usually with the addition of a small quantity of brandy, without allowing the must (unfermented grape juice) to reach fermentation, in order to conserve the sugar content of the wine. The grape thrives best in volcanic soil.

The wine is supposed to have originated on the Greek island of Samos, where it is still made. Its most celebrated brands are those of Malaga, Sitges, and Tarragona in Spain; the Moscatel Branco of Portugal; the Muskotaly grown in several parts of Hungary; as well as the Rousillon of France, produced in the department of Pyrénées-Orientales. Italy's Lacryma Christi, grown on the slopes of Vesuvius, is famous for its excellent taste.

The muscatel of Montefiascone owes its strange name Est Est Est to an ancient story: the German bishop of Regensburg, Sigmund Fugger, sent his valet out to taste the wines of a number of inns and mark *est* on the wall wherever he found a good wine, and *est, est* where the wine was very good. When the valet tasted the Montefiascone muscatel he became so enthusiastic that he wrote over the inn door, *est! est!! est!!!*

Other fine Italian muscatels are the Salento, and the Greco di Gerace of Calabria; and the Canelli of Piedmont. The Zibibbo, grown on the island of Pantelleria, and two Sicilian wines, the Noto of Syracuse, and the Zucco of Palermo, are also exported to the United States, and enjoy great popularity among Italian-born Americans.

The climate and the volcanic soil of California are favorable for growing muscat grapes, and a good muscatel wine is produced there; its color ranges from straw to amber. See also WINE AND WINE MAKING.

MUSCATINE, mŭs'kā-tĕn, city, Iowa, and Muscatine County seat; altitude 552 feet; on the Mississippi River; 25 miles southwest of Davenport; on the Chicago, Rock Island and Pacific, and Chicago, Milwaukee, St. Paul and Pacific railroads. It is at a bend in the river where the waters change from a westward to a southward current. As is usual along the west bank of the Mississippi, the city is on high bluffs which command an extended view of the river. High Bridge here connects Illinois and Iowa. Muscatine is in a fertile agricultural region in which there is considerable woodland. Muscatine Island, just below the city, is famed for its watermelons and fine vegetables. The chief industries of the city are connected with the manufacturing of machine shop products, pearl buttons, food preserving, sashes and doors, lumber, alcohol and fusel oil, rolling mill products, and overalls. It has a large trade in its manufactured articles, farm and dairy products, hogs, lumber and fruit. Muscatine was first settled in 1833 as a trading post. In 1836 the town site was surveyed and called Bloomington. The name became Mus-

catine in 1849. By this time, the town was becoming an important lumber center. Huge rafts of logs were floated down the river to the sawmills here. It was a military post during the Civil War with Camp Strong, on the island, a concentration point. Samuel L. Clemens (Mark Twain) lived in Muscatine for a time, and Ellis Parker Butler, author of *Pigs Is Pigs*, was born here. The city government is operated under its original charter granted in 1838, revised in 1852. Pop. (1950) 19,041.

MUSCHELKALK, mŭsh'ĕl-kālk, a German name, signifying shell lime, applied to geological beds of middle Triassic or New Red Sandstone period, occurring in the Alps, in northwestern Germany, Alsace and Lorraine, Swabia, Franconia, Hesse, Thuringia and upper Silesia. The name is due to the many fossil remains of Cephalopoda, Encrinites and Mollusca in general found in the limestone masses of these beds. The Muschelkalk is divided into lower, middle and upper. The beds contain valuable minerals such as salt, marl and gypsum.

MUSCICAPIDAE, mŭs-ĭ-kāp'ĭ-dē, a large family of oscine passerine birds, consisting of the Old World or true flycatchers. The typical genus is *Muscicapa*, including the common European spotted flycatcher.

MUSCIDAE, mŭs'cĭ-dē, family of flies from the Latin *musca*, a fly. The most familiar examples are the housefly and the blowfly. They belong to the order Diptera and their wings have the characteristics of the family, being naked, furnished with a single pair; the proboscis is used for sucking, ending in two fleshy lobes. The flagellum of the antennae is generally plumbed with hairs on both sides (the tsetse, however, on one side only). Upper surface of thorax has a transverse suture and the feet have a pair of adhesive pads. Their presence is almost universal, as they thrive in the cold northern latitudes as well as in tropical climes. The eggs are laid and hatched in filth. The species reaches a large and varied assortment.

MUSCLE. See MUSCLES.

MUSCLE SENSATION, a loose and vague phrase, otherwise muscle sense, to express the sum of sensations that come from the joints, skin, muscles and tendons in the act of making muscular movements. It is also applied to a generalized dull sensation which results from the stimulation of a muscle, either from electrical discharge or from fatigue following the long-continued stimulation of either a voluntary or involuntary muscle. The perceptions of muscular sense are usually grouped under (1) those of posture, the sensations occurring while standing, sitting or maintaining some unusual position being characteristic and recognizably different for each relative position of limbs; (2) those of the passive movement, in which a limb is moved by another person; (3) those of the active movement; (4) those of resistance to movement. The case of passive muscular sense is not to be confused with that of the so-called static sense, which is a sensation of change of direction, which one gets while being transported through space, or turned or inverted, and is mediated through the

semi-circular canals of the ear. The muscle-sense is of much importance in imparting information concerning the relative position of the different members of the body, and its loss in this particular (asterognosis) constitutes a valuable symptom in the diagnosis of certain nerve disorders. The muscle-sense is all-important in maintaining bodily equilibrium. Each joint in the body possesses a varying degree of delicacy in this function of equilibrium. Thus the shoulder-joint is considered to be 40 times as delicate in this respect as the joints of the fingers. Angle of bending and speed of movement are both important in the interpretation of these joint-sensations. Muscle-sense in all its bearings has close relations to accuracy and skill in all limb-movements, as seen in musical performances, marksmanship, ball-playing, billiards, golf, etc., in all sports and games requiring delicate muscular adaptations. The muscle-sensations may become a seat of a great deal of autoerotic pleasure, even exclusive of merely genital masturbation, as may be seen in certain forms of dancing. In persons who take an undue interest in athletics there is frequently in addition to the exhibitionistic motive a large factor of gratification of the libido (q.v.) through merely muscular contractions, the development of muscular strength feeding the unconscious desire for power and superiority in a sphere which frequently excludes real social aims. Consult Henri, 'Année Psychologique' (Vol. V, 1899, with full bibliography); Baldwin, 'Dictionary of Philosophy and Psychology'; Schäfer, 'Physiology' (1900); Kempf, 'The Autonomic System and the Personality' (New York 1919).

MUSCLES. The organs called muscles are made up of a collection of muscle-cells, which have for their function the accomplishment of bodily movements. These movements may be gross, as in walking, or very minute, such as take place in the contracting movements of the arteries or veins; they may be voluntary, brought into action by wishes and called "willed" impulses made possible by the brain structures, or they may be involuntary and brought about by acting through the vegetative nervous system (q.v.). The muscular movements necessary in writing are illustrative of the voluntary type; the heart-beat, of the involuntary variety. In point of evolutionary development the involuntary movements may be said to have preceded the voluntary, and hence in regard to complexity of structure the involuntary muscle-cells are simpler than the muscle-cells that perform voluntary movements, and to these two types of cells students of minute anatomy have given the names of unstriated or involuntary muscle, and striped or voluntary muscle. The muscular tissue of the heart is of intermediary character. It is a striped involuntary muscle. Muscle-tissue, like protoplasm, is strongly contractile, but unlike ordinary protoplasm, which can contract in all directions, muscle-substance can contract in only one direction. The simplest type of muscle-substance is seen in many lower animals. In these the muscle-cells are elongated spindles with sharpened points and with a single elliptical to rod-shaped nucleus, situated about the middle of the fibre. They show a faint longitudinal striation, vary in length from 40 to 500 microns (1-600,

1-50 of an inch) in length, and 3 to 8 microns (1-8000, 1-3000 inch) in diameter. These muscle-cells in man correspond to the unstriated muscle-cells, are bound together in bundles or flattened plates by an inter-cellular cement-substance and are found more particularly in the walls of the intestine, the trachea, bronchi, blood-vessels, bladder, ureter, uterus, in many of the organs of the body, and in glandular structures. They have a rich blood-supply and a nervous network of sensory terminal filaments, as well as fibres from the vegetative (old term was sympathetic) nervous system. The pains of an intestinal colic, of a gall-stone, of childbirth, are all due to forcible contractions of these involuntary muscle-cells in the respective organs. The more prominent muscles of the body, such as those that move the various bones, the muscles proper and such as are eaten as roast beef are of the striped variety. These are a modification of the simple spindle-cells. In man they originate in the mesoderm, muscle-substance commences to form in the interior of some of the cells; these elongate, many nuclei are formed and the final result is a bundle of much elongated cylindrical cells 12 centimeters (2 inches) long and from 10 to 100 microns (1-2500 to 1-250 inch) broad. Each cell is covered by a special sheath, the sarcolemma, and within is made up of very intricate and minutely structured protoplasm, the most striking feature of which is its banded or striated appearance; hence the name striated. Just within the sarcolemma a number of flattened elliptical muscle-nuclei are found. In insects striped muscle-tissue can be studied to best advantage. Occasionally branched forms of striated muscle are found. Blood-vessels are numerous in striped muscle and lymphatics and nerves are also abundant. Special types of nerve-endings and muscle-plates, are characteristic of voluntary muscle. Striped muscle is probably a combination of types of muscle. The sarcoplasmic substance is thought of as of unstriated muscular origin, and it is probably innervated by the vegetative nervous system. This type of innervation is that which keeps its metabolism in order, and also contributes to what is known as muscle-tonus. The emotions act through this part of the muscle probably. The other part of the muscle, called the anisotropic disc, is probably innervated by the sensori-motor system and is that part of the muscle which carries out willed or wished actions.

Heart-muscle differs from ordinary striped muscle by having shorter oblong cells, which are branched. There is no sarcoderm and the cells contain but one or two nuclei, which are situated in the centre of the muscle-substance. Blood-vessels, lymphatics and nerves are plentiful in the heart-muscle.

Groups of these muscle-cells, with connective tissues, tendons and fat, make up the gross muscles of the human body. The voluntary muscles are all attached to bony structures; the involuntary muscles are found in the softer parts. Contraction and expansion are the expressions of their functions, each set of muscles being provided with antagonists, and it is characteristic that in response to pleasure-giving stimuli movements of expansion result, whereas under painful stimuli contraction is marked. Modern psychological theories have been

founded on this fundamental principle, emotional states being interpreted as being founded on visceral muscular activities. The forms of external stimuli that can cause muscular action are usually classed as mechanical, chemical, thermal and electrical. Excess of stimulus brings about a condition of fatigue in muscle. This is accompanied by diminished muscular power, by pain or discomfort, by diminished reflex excitability and by vague symptoms in the body indicative of some perversion of metabolism.

Muscles are classified in various ways, according to structure or according to their function, or by their positions and situations in the body. For example, some muscles are attached to bones, which they move after the fashion of levers. Such muscles are said to arise or take origin from definite points of bones and are generally inserted into bones by tendinous prolongation of the muscular substance. The insertion is the moving point, and the origin the fixed point of the muscle. The tendons of muscles vary in length and breadth. They represent inelastic bands of fibrous tissue, the fibres of which insensibly merge into and become continuous with their attached muscular fibres. When the tendinous fibres of muscles become greatly broadened out, so as to form fibrous webs or membranes, which separate or enclose muscles, or which afford extensive surfaces for their attachments, the term aponeuroses is then applied to them. Such aponeurotic expansions are seen in the terminations of the muscles of the abdominal wall, in the scalp and in other situations. The limit or extent of the action of a muscle is determined by the length of its fibres, whilst its degree of force or strength depends on the number of the fibres. Other muscles are not attached to bones as levers, but on the contrary surround and enclose cavities, which they limit or expand as required. Such hollow muscles are exemplified in the heart and uterus, in the muscular fibres of blood-vessels, in the muscles of the digestive tract, in the iris of the eye, etc.

The nature, mode and effects of muscular action may be briefly considered in connection with the present subject. The muscles which have the most active functions are those most abundantly nourished. Every action on the part of a living being results in the production of a certain amount of waste material, evinced by perceptible differences in the chemical composition of the tissue. And when it is remembered that the nervous and vascular supply of muscle is also concerned in muscular work and waste, the entire question is then to assume aspects of a very intricate and complicated nature. Increased exercise of muscles—as seen in gymnastic exercises, or in the exercise of certain trades (for example, the arms of the blacksmith and the lower limbs of the ballet-dancer)—demanding increased nutrition, results in the increased growth of the muscle and in the formation of new tissue. This result, it is evident, can take place only when the nutrition of the tissue keeps pace with or slightly outstrips its waste and wear.

The property of contractility distinctive of muscular tissue, and through which its functions are manifested, is generally, though not always or invariably, brought into action through the stimulus of the nervous system or

more widely speaking, through stimuli conveyed to the muscular fibres through the nerves. The subject of the various kinds of muscular actions involves both physiological and mechanical considerations. The voluntary muscles thus constitute moving powers for the bones as levers; and in the living body examples of the three kinds of levers which mechanical science distinguishes are found. In the familiar action of the biceps muscle, which flexes or bends the fore upon the upper arm, is seen an instance of a lever of the third kind, in which the power (represented by the insertion of the muscle on the radius or bone of the fore-arm) is placed between the fulcrum (at the elbow-joint) and the weight (in the hand). The lever of the second order may be illustrated by the raising of the body upon the toes, as in the act of making a step forward in walking. Here the weight (represented by the body pressing on the ankle) is placed between the fulcrum (formed by the fixed toes) and the power represented by the muscles of the calf. The head moving on the spine illustrates a lever of the first order; the fulcrum being represented by the atlas vertebrae, the power by the muscles of the neck and the weight by the heavier portion of the skull situated in front of the spine. See ANATOMY.

Editor *Journal of Nervous and Mental Disease.*

MUSCLES, Diseases of. Very little is known of the diseases of muscles themselves. Muscle-tissue, in common with other types of tissue, undergoes certain forms of degeneration, fatty, mucoid, gelatinous, calcareous, etc., but of the diseases of the muscular tissues themselves there are few well-defined types. The reason for this lack of definite information bearing on diseases of the muscles is largely due to the close relationship that the nervous system bears to the muscular system. This renders it almost impossible to distinguish between a disease of the muscle and a disease of the nerve structures which are distributed to that muscle. Thus, at the present time, it is held that many of the forms of muscular atrophy and some of the forms of muscular dystrophy are forms of the diseases of the nervous mechanism of the muscle rather than disease of the muscle itself. In former times these were classed as diseases of muscle.

Myositis, simple inflammation of the voluntary muscles, is a form of acute or subacute inflammation in the muscle, due probably to some infectious organism. It is characterized by stiffness of the muscles and with swelling in the muscle-substance. It is usually progressive, the muscles of the body becoming stiff hard and fragile, and undergoing fatty degeneration. Myositis is probably a very rare affection, and it is not yet known whether it is a primary or a secondary condition. Ordinary muscular spasms or muscular cramps are in reality localized neuralgias in the muscle, and should be considered as of nervous rather than muscular origin. Lumbago is one of the conspicuous examples of a neuromuscular affection. It is probably located in the sarcoplasm of the muscle, and results from disturbance of the vegetative nervous system control of the muscle. It may be a result of emotional upsets.

or follow undue exercise. Myoclonia or Friedrich's disease, and myotonia, or Thomsen's disease, are two forms of disease affecting the muscular system.

Myositis ossificans is a very rare chronic affection of muscles, during which the muscles become harder and harder, and finally develop bone-like transformations, so that the patient becomes like the ossified man of the circus. As a matter of fact most of these cases drift into museums and circuses. Very little is known as to the cause of the disease, and treatment is unavailing. Consult Jelliffe and White, 'Diseases of the Nervous System' (3d. ed., 1919).

MUSCLE SHOALS, a 37-mile stretch of rapids in the Tennessee River in northern Alabama, 259 miles above the point where that stream empties into the Ohio at Paducah, Ky. This section of the river has a total vertical fall of 134 feet, creating an extremely rapid current, and has been a barrier to river traffic since the canoes of the first fur traders were portaged around it.

In 1824 the State of Alabama began work on a canal around the shoals to aid navigation, the cost being paid from the sale of 400,000 acres of public lands granted by the government. This canal was opened in 1836. In 1875 Congress appropriated more than \$3,000,000 for a new and more adequate canal, which remained in use until 1918, although it was never entirely satisfactory, since it, like the first, did not provide for year-round navigation.

When the United States entered the World War in 1917 the country was faced with the possibility of a shortage of nitrates for use in the manufacture of high explosives, and in that year the Government, under Section 124 of the National Defense Act, began constructing equipment at Muscle Shoals to provide this element.

The original project included two dams (one of which was called Wilson Dam) and two nitrate plants. One of the nitrate plants was completed in 1918. The Armistice ended the need for nitrates and work on Wilson Dam was not completed until 1925.

Wilson Dam is 4,860 feet long, and rises 137 feet above foundation. It is equipped with two navigation locks, each 300 by 60 feet. Lack of appropriations occasioned numerous interruptions in its construction by the Corps of Engineers of the U. S. Army. Despite these interruptions, it was completed at a cost of \$47,000,000. Wilson Dam is now equipped to generate approximately 260,000 h.p., and has an ultimate capacity of more than 610,000 h.p. when all units are installed.

In March 1921 the Government invited offers from private firms for the disposition of Muscle Shoals, and in July, Henry Ford submitted a proposal, agreeing to purchase the plant and to manufacture fertilizer in accordance with Government requirements. His plan called for a 100-year lease of the power and for additional expenditure by the Government. Ford later modified his offer, Congress took no action on it, and he withdrew it in 1924.

Senator George W. Norris introduced his first bill for Government operation of these properties in April 1922. The Norris bill was passed but vetoed by President Coolidge in 1928 and again by President Hoover in 1931. In the meantime, power generated at the dam was sold to private companies operating in that area.

The Norris bill was reintroduced in the first session of the 73d Congress in 1933, following the election of President Roosevelt, and in May 1933 this bill, with several amendments, passed both houses of Congress and was signed.

Later in 1933 all Government property at Muscle Shoals was placed under the supervision of the Tennessee Valley Authority. Recognizing the need of the nation for phosphatic fertilizer, the Authority remodeled a portion of Nitrate Plant No. 2 and the production of fertilizers was begun.

The power from Wilson Dam is being used for TVA construction, for the production of phosphate fertilizers by the Authority, and surplus energy is being marketed in line with the terms of the Act passed by Congress creating the TVA. A large part of this power is being sold wholesale to municipalities and to county-wide co-operative associations.

Wilson Dam eliminated only 15½ miles of shoals. With the completion, however, of the Pickwick Landing Dam in southwestern Tennessee, below Wilson Dam, and of the Wheeler Dam in northern Alabama, at the head of Wilson Lake, the entire stretch of shoals will have been eliminated as a hazard to navigation and a nine-foot channel for navigation provided.

MUSCULAR SYSTEM, Development of.

Two main forms of muscle-tissue (see MUSCLES) exist in the human body, the striated muscle-tissue, which makes up the muscles of the bony framework of the body, and which responds to willed or wished impulses passing through the brain structures, and also to vegetative stimuli of the unstriated muscle-tissue, which chiefly responds to automatic stimuli of unconscious nature by means of the vegetative or sympathetic nervous system. Some control of vegetative functions may be exercised by conscious processes. (See NERVOUS SYSTEM). The heart-muscle is regarded as an intermediate form, resembling striated muscle-tissue, but in its development more nearly allied to the more primitive unstriated muscle-tissue. Non-striated muscle-tissue is formed by a direct transition of certain cells in the middle germinal layers (see EMBRYOLOGY) or mesenchyme. At first these muscle-fibres are irregularly distributed, but later they are collected into small bundles or into layers, and become associated with the individual organs with which they functionate. Striped muscular tissue develops from the same layer, but the details of development, as is the case in the histogenesis of the

heart muscle, are extremely complicated. The cells at first develop a meshlike structure or reticulum. This reticulum develops small discs, which later become small columns of muscular tissue. The columns at first develop at the periphery of the cell, and gradually fill in around the nucleus, which in the heart-muscle lies in the center of the cell, whereas in the muscles of the skeleton the nucleus is pushed to one side, or disappears, new nuclei appearing just beneath the sarcolemma-sheath. The skeletal muscles develop in regular order from the different segments (somites) of the mesoderm. In the early stages the distribution is very symmetrical, but later it becomes extremely uniform by reason of the irregular welding of different segments of the bony skeleton. There remains, however, a regular association of the muscular myotomes and their embryonic nerve supply, and the homologies of structure may be traced by the nerve-supply, although the muscles themselves may have shifted from their original position. This is a question of highly technical nature, but has many practical bearings in modern medicine. Thus the great broad muscle of the back, the *latissimus dorsi*, which arises from the seventh and eighth cervical segments, but later migrates and is fastened all the way down the spine as far as the crest of the hip bone, is supplied by a nerve which also develops from the seventh and eighth cervical nerves. The development history of each skeletal muscle can thus be traced by means of its nerve supply. The whole process is one of extreme intricacy and should be studied in special monographs.

Evolution of Muscular Tissue.—As in the development of the muscular system in man there has been a gradual evolution of the plan of muscular arrangement, so in the animal series there has been a gradual development of a muscular system from the very simplest types of contractile protoplasm. Even in plants definite movements may occur which may be very slow or very rapid. Yet no muscular tissue proper has ever been found in plants. Many of the lowest plants, the *Algae*, are motile and are provided with vibratory cilia, but these minute hairs, although capable of rapid motion, cannot be regarded as muscular organs. In the contracting protoplasm of the lowest animals, the rhizopods, although movements take place, there is no muscle tissue. Nor is muscle tissue found in the next higher group, the *Infusoria*, although very actively moving forms are known, for example, the familiar microscopic animal *Paramecium*. The bell animalcules, *Vorticella*, *Stentor*, etc., have stalks that coil and uncoil with great rapidity, but they contain no muscle tissue proper. They do, however, contain what are termed myronemes, and spironemes, which are longitudinally striated and have as many functionate as muscular organs. In another genus of infusorians (*Bursaria*) there is a contractile band about the body of the animal. It has been regarded as a true sphincter muscle. It has not the structure of the developed unstriated muscle cell. In the closely allied sponges (*Porifera*) certain elongated cells with rod-shaped nuclei are found, and may be considered the ancestral forms of the unstriated muscle cell, although it is not until the group of the *Coelenterates* is reached that

true unstriated muscular tissue is present in its more advanced forms. In many of the hydroids, a form of external neuromuscular cell is found. This is a type of cell half nerve, half muscle, but not resembling true muscular tissue. In the jelly-fishes of this order both neuromuscular tissue and true unstriated muscle fibers are found. In the sea-anemones unstriated muscle is abundant. It is mostly developed, however, from the external layers of the body, and thus embryologically is not comparable to the muscle tissue that in practically all the animals higher than the coelenterates is formed in the middle germinal layers of the developing animal. In one of the higher coelenterates, the common water-hydra, some muscle cells are found imbedded in the deeper tissues of the body, thus foreshadowing the higher type of muscular tissue. In the next great family of animals, the *Echinodermata*, to which the sea urchins, starfishes and sea cucumbers belong, unstriated muscle tissue is common, but no evidence of striated or striped muscle is yet present. In the worms the muscular tissue is unstriated and abundant. In the mollusks, the foot of the soft clam, the muscle of the oyster, are made up of unstriated muscle fibers. A higher order, the *Arthropods* or *Crustaceans*, including the crabs, lobsters, etc., contains a well-developed muscular system, which is made up of striated muscle, practically the first appearance of this type of muscle in the animal kingdom. In these animals, moreover, there is a type of development of the muscles that anticipates the regular segmented type, metameres or myomeres, of higher animals. See also ANATOMY, COMPARATIVE.

From the crustaceans onward both types of muscle tissue are found. In the low vertebrates, *selachians* and *fishes*, typical heart-muscle cells, striated and with central-lying nuclei, are found.

SMITH ELY JELLIFFE, M.D.
Late Editor, *Journal of Nervous and Medical Disease*.

MUSES, goddesses of the liberal arts and sciences; originally nymphs of inspiring fountains. At first three Muses only were known: Melete, Mneme, and Aoide. Four Muses are sometimes mentioned as the daughters of Zeus and Plusia, Melete, Aoide, Arche and Thelxinoe. At other times there are said to have been seven, at others eight in number. Nine Muses are also enumerated as the daughters of Pierus, king of Emathia, but these were not the nine generally recognized. The latter were Clío, Euterpe, Thalia, Melpomene, Terpsichore, Erato, Polyhymnia, Urania, and Calliope. Among the adventures of the Muses their three contests with the Sirens, with the daughters of Pierus and with the bard Thamyris, in all of which they were victorious, are particularly famous. The customary occupation of the Muses was singing and dancing. Separate attributes were not till a comparatively late period assigned to the individual Muses. Calliope became the Muse of epic poetry. She was the most distinguished among the Muses, the protectress of kings, whom she endowed with eloquence and song.

Clio became the Muse of history; Erato of lyric poetry and music, particularly of wind-instruments; Thalia of comedy; Melopomene of tragedy; Urania of astronomy; Erato of lyric and erotic poetry; Polyhymnia of the sublime hymn; and Terpsichore of the dance. They are commonly represented as beautiful virgins, adorned with wreaths of palm leaves, laurel, roses or the feathers of the Sirens. They dance in a circle, together with Apollo, who in later times was styled Musagetes, or leader of the Muses. Their worship extended from Greece to Italy. In Rome they had a separate temple, and a grove was sacred to them. The swan, the nightingale and the grasshopper were also sacred to them.

MUSEUM OF ART, Metropolitan. See ART, METROPOLITAN MUSEUM OF.

MUSEUMS are institutions for the preservation, study and display of natural objects, or of those made by man, while as a sequence of study comes the publication of information thus derived. The word museum originally signified merely a grove or other locality sacred to the Muses, but with the development of the museum the word has undergone a parallel course of evolution until it has come to have its present meaning. The next use of the term was for an institution devoted to the study of philosophy, literature and art, but not including the preservation and display of objects; in this sense it was applied to the famous Museum of Ptolemy Soter at Alexandria. While this was in the nature of a university, there is some reason to believe that collections of plants and animals were attached to the institution so that it may be regarded as the prototype of the more modern botanical and zoological garden. In modern sense public museums are of comparatively recent establishment, and as educational factors, of later date than art galleries and libraries, although like these having their beginnings in the gratification of the desires of private individuals. The origin of the art museum is to be found in the collections of statuary, paintings and other works of art, made by kings, nobles and men of wealth; the germs of the modern museum of natural history were the cabinets of miscellaneous curiosities brought together by students, merchants, or men of leisure. Many of these collections subsequently developed into important public museums, the most striking example, and the one most frequently cited, being the British Museum (q.v.), which was the final outgrowth of the cabinet and library of Sir Hans Sloane. In the United States the Museum of Comparative Zoology, at Cambridge, Mass., has grown from the collection made by Louis Agassiz (q.v.) for his own use, until it has become one of the most important museums in this country. Even the United States National Museum, if not the direct outgrowth of a private collection, was indirectly due to the labors of individuals, for its nucleus is to be found in the specimens gathered by the National Institution (later the National Institute), a body organized with the avowed purpose of directing the bequest of James Smithson (q.v.) and engaging in pursuits in accordance with its terms.

The lineal successors of the cabinets of private collectors were the museums of scientific societies where specimens were gathered for

purposes of study and display, and while these still exist they have largely given place to museums supported by the State or municipality. Private collections are more numerous than ever, but these are rarely formed with any intention of displaying their contents to the public, although there are some notable exceptions, as in the museum of the Hon. Walter Rothschild at Tring. Ultimately, however, a large proportion of these private collections find their way to public museums through the liberality of their owners, or by bequest.

Another step toward the establishment of public museums was the formation of collections of objects of more or less popular interest and their exhibition to the public on the payment of a fee. Notable examples of these abroad were those of Sir Ashton Lever and Charles Bullock, which flourished in London during the latter portion of the 18th century and first part of the 19th. It is interesting to note that one of the earliest cabinets formed in the United States, that of Mr. Arnold, of Norwalk, Conn., was sold to Sir Ashton Lever, while later on the "Leverian Museum" was sold and its specimens scattered among the great museums of Europe.

Early American Museums.—In this country the principal recent museums of this character were the Boston Museum and Barnum's Museum in New York, in both of which the idea of amusement predominated, the first named being a rather incongruous introduction to a theatre. Both, however, contained some really valuable specimens of natural history and Barnum was among the first to exhibit living fishes. Of a very much earlier date and more scientific in their aims were the museums conducted by Charles Willson Peale and his son, Rembrandt Peale, in Philadelphia, established in 1785 as the Philadelphia Museum, and from 1822 to 1828 installed in Independence Hall. This museum is of particular interest from the fact that many of Peale's ideas as to the arrangement and educational value of museum collections were in advance of his time. In his use of painted backgrounds and the addition of nests and eggs to the exhibits of mounted birds we have the germ of the elaborate habitat groups shown in modern museums.

The modern "dime museum" with its exhibit of "freaks" is a survival of this phase of museum development, and the catalogues of some celebrated old collections will show that they comprised many very similar objects, as well as those of real value from a naturalist's standpoint.

Government Museums.—The final step in the establishment of public museums, the transferral of collections from private to governmental ownership, may be said to date from the founding of the British Museum in 1753. At first admission was by ticket and limited to 30 persons per day; in 1810 the museum was made accessible to the public for three days a week, and not until 1879 was it open to the public daily. The United States National Museum was only formally created in 1876, although so early as 1846 the government possessed collections which were in the custody of the Smithsonian Institution. Exploration has done so much for museums that it may almost be included among the causes that have led to their

formation. The colonization of America brought to Europe many examples of new plants and animals, while the Dutch East India voyages did the same for southern Asia, and it is surprising to see how large a number of species from these regions was described by Linnaeus and others so early as 1760.

In more recent times the Wilkes Exploring Expedition of 1838-42 and the government surveys for a route for the Pacific Railroad had a very decided influence on the origin and growth of the United States National Museum, and there is scarcely an institution that has not been benefited in a similar way. It is but a step from expeditions in which scientific results were subordinate to practical ends to those undertaken solely for scientific purposes, and the systematic exploration of our Western Territories for fossils by such institutions as the American Museum of Natural History and the Carnegie Museum, and by Yale, Princeton and other universities, has become a matter of almost daily news. Another most important factor in the development of museums has been national or international exhibitions. These have had a direct effect in bringing together collections illustrative of natural or industrial resources, and a more indirect influence in stimulating methods of arranging and displaying such material. The London Exhibition of 1851 led to the establishment of the South Kensington (now Victoria and Albert) Museum, and the ethnological museum of the Trocadero was one of the outcomes of the Paris Exposition of 1889. Our own Centennial Exhibition was the direct cause of the erection of a building for the United States National Museum and of the founding of the Pennsylvania Museum of Art, while from the Chicago Exposition came the Field Columbian Museum, the Chicago Art Institute and the Philadelphia Commercial Museum. Other causes play minor parts in influencing the lines of growth of museums both small and great. Thus the extensive colonial possessions of Great Britain have been largely instrumental in making the vertebrate collections of the British Museum, the greatest in the world, while the museum at Leyden is not far behind owing to the former extensive commerce of Holland. In the United States the large deposits of fossil vertebrates in the West, their general accessibility, the imposing appearance of many of the specimens and the important results to be derived from their study have given a great impetus to the formation of palaeontological collections, while special attention has been given to the preparation and exhibition of this class of material. The display of fossil vertebrates in the American Museum of Natural History is unrivaled, and other notable exhibits are to be found in the Museum of Yale University, and in the Carnegie, Field and United States National museums. The National Gallery of Art and the Freer Collection, installed in a building of its own, both forming parts of the United States National Museum, were respectively the gifts of William T. Evans and Charles L. Freer.

Popular Display of Specimens.—What may be termed the popularizing of museums has but recently taken place, and while the display of objects has always been regarded as one of the functions of museums, it is a branch which

has received particular attention only during the past 30 years. Originally the larger part of the specimens of birds and mammals were placed on exhibition, but it became evident that this meant the injury or even loss of many, and that the public cared little for large monotonous series of stuffed animals. At present the number of objects on exhibition is relatively small compared with those in the reserve or study series, and there is a very general effort to display at least a part of the specimens amid their natural surroundings. The influence of the private collector has probably had much to do in bringing about this change, and the British Museum, under the administration of Dr. Günther, was the first of the great museums to introduce groups of birds, with their natural surroundings, as a part of its exhibition series. These were largely added to under the directorship of Sir William Flower, who took great interest in the problem of rendering museums attractive and instructive, while, following this example, the American Museum of Natural History took the lead in this direction in the United States. To the museum of Leyden, Holland, however, belongs the credit of having before this departed from the tradition that mammals must be stuffed in stiff and formal attitudes and caused some to be mounted that bore some resemblance of life. Change in the character of the exhibits has been accompanied by equal changes in the matter of labeling and to some extent in the publications issued by museums, so that from being merely storehouses of material for the benefit of a few they have become great schools of instruction for the many.

School Work of Museums.—In direct line with what may be termed passive educational work by means of carefully arranged and well-labeled exhibits is the active participation of museums in the work of public schools of all grades by means of circulating loan collections, the giving of lectures at museums or sending lecturers to the schools, and the loaning of series of lantern slides to illustrate such subjects as natural history, geography, history or technology, and in this connection motion pictures have been found most helpful.

The initiative in this line seems to have been taken by the Buffalo Academy of Sciences in 1872 and the Davenport Academy of Sciences in 1878, in both cases by means of lectures given at the museum. The Public Museum of Milwaukee appears to have been the first to loan definitely selected material; the American Museum of Natural History, under the administration of Professor Bickmore, the first to give systematic courses of lectures more or less correlated with school work. This latter institution was also the first to establish a department of public education (instruction) for the sole object of co-operating with the public schools.

Following in the lead of these institutions, or acting independently many other museums have actively engaged in school work, notably the Commercial Museum of Philadelphia, Chicago Academy of Sciences and the Educational Museum of the Saint Louis public schools. This last, the first to be devoted exclusively to school work, though founded by the board of education in 1904 as an outcome of the exposi-

tion of that year, is a museum of distribution rather than of exhibition, its work being the training of specimens, charts, models and similar objects to the public schools.

Classification.—Museums may be grouped or classified by their contents, or according to the purposes for which they were established. Following the first method Dr. Goode has divided them into museums of art, history, anthropology, natural history, technology and commerce. A museum may be established for any of these great subjects as a whole or for one of the many branches in to which they may be subdivided. Thus a museum of natural history may comprehend both animals and plants, or one of the other of these primary divisions; it may include the animals of a single continent, a single geographical region or be restricted to those of one locality; it may be devoted to some large group, as mammals, birds or insects, to some minor division, as birds of prey, butterflies, etc., and may or may not include fossil species. Technology may be greatly subdivided, and while the favorite and more striking subjects are shipbuilding and railroads, there are also museums of hygiene and textile fabrics, while the United States National Museum contains collections illustrating the development of electrical apparatus. And technology may trespass on art in the matter of ornament, or, like art, be included in a historical collection illustrating the progress of mankind or of one nation.

According to the purposes for which they are founded Dr. Goode distinguishes national museums; local, provincial or city museums; college and school museums; professional or class museums; and museums or cabinets for special research owned by societies or individuals. This scheme of classification is open to the objection that it confuses purpose with ownership or administration, since, for example, national and municipal museums are not merely for the display of objects found within their boundaries, but for those belonging to the nation or city.

College and school museums have for their immediate purpose the formation of collections that shall aid students in understanding various problems connected with science, technology or art, but they are usually extended beyond this and become more or less general in their character. This has been the case with the museums of Harvard and Yale universities and is notably true of many foreign museums, such as that of the Royal University of Prussia, which is the national museum. The professional museum is for the illustration of some special occupation or line of research such as mining, medicine or even psychology, which has a museum at Florence founded by Mantegazza. The largest institution of this kind is the Museum at the Royal College of Surgeons, London, which has developed from the private collection of John Hunter.

The Army Medical Museum, Washington, had its inception during the Civil War as a museum of pathology and military surgery, but its scope has been so extended that it offers a fairly comprehensive history of the progress of medicine and surgery. The library established in connection with this museum has grown to be the first medical library in the world.

Modern European Museums.—Europe nat-

urally has the greatest number of governmental museums, the capital of almost every state claiming at least one museum of natural history and an art gallery, and often anthropological and technological collections as well. Paris, with some 30 museums, probably leads in the matter of national collections, while Berlin and Vienna have respectively about 20 and 15 museums. Turkey forms a notable exception to the above statement, for Friedlander's Directory contains no mention of a Turkish museum, although a commercial museum has been established at Constantinople. Great Britain has the largest number of local museums, those devoted to the preservation and display of objects illustrating the natural history and archæology of the immediate vicinity, and, as a whole, these are better administered than those of other countries, great care being devoted to labeling, arranging and otherwise making the collections interesting and instructive to the public.

Europe in general and Germany in particular possess many technological museums devoted to the illustration of such subjects as mining, pottery making, weaving, shipbuilding, machine construction and operation and similar topics. Perhaps the most important of these is the Deutsche Museum of Munich, which among other exhibits has a considerable number of working models of such machines as locomotives, so constructed that a large number of the parts is visible, and may be set in motion by the visitor.

Modern American Museums.—There are now nearly 600 museums in the United States, about three-fourths of them attached to colleges or under the supervision of societies, but comparatively few of these are active or important. Nearly half of the whole number are entirely or chiefly devoted to natural history and about 10 per cent to art, though this proportion seems on the increase and the past decade has witnessed the establishment of several important museums of art. A considerable number of museums are general in their character, including both art and natural history.

About 25 per cent of our museums include or are devoted to history, but here again few are active, though there are noteworthy exceptions, such as the Essex Institute of Salem, Mass., and the Historical museums of Chicago and Buffalo, the latter of which makes a specialty of publication.

The United States is strangely poor in technological museums or even in extensive technological collections, though these are steadily on the increase. There is, for example, no museum of naval architecture in this country, the nearest approach to it being the collection of the United States National Museum, in which certain phases of the subject are well represented.

Our oldest existing museum, as well as the first public museum in America, is the Charleston (S. C.) Museum, founded by the Charleston Library Society in 1773, later incorporated in the College of Charleston and recently passing to municipal control, thereby taking on a new lease of life. Next to this is the Peabody Museum of Salem, the successor of the East India Marine Society Museum, founded in 1799; it also includes the natural history collections of the Essex Institute.

The Museum of Comparative Zoology, Harvard University, holds the first place among college museums. It is not confined to zoology, as its name might imply, but covers the entire field of natural history. The mineralogical collection dates back to 1793 and is probably the oldest of its kind in America, while the botanical section includes the Gray Herbarium. The nucleus of the Museum of Comparative Zoology was the private cabinet of Louis Agassiz, which was purchased by subscription for \$12,000 in 1852. In 1858 an allowance was made for the maintenance of the museum and in 1859 the State of Massachusetts assumed an interest in the institution, at the same time appropriating \$100,000 for its increase; \$71,000 was also raised by private subscription. In 1876 the State assigned its rights to Harvard College and since that time the museum has been maintained by the university, although the great increase in its collection was principally due to the liberality of Alexander Agassiz, who expended over \$1,000,000 for that purpose. An important museum of anatomy is attached to the Harvard Medical School. The Museum of Yale University contains the Marsh collection of fossil vertebrates, comprising many types, as well as the largest collection extant of fossil footprints, while brachiopods and sponges are well represented. In other departments are a fine series of modern corals and many rare archaeological specimens. The Museum of Yale University is temporarily in storage and there is no immediate prospect of a new building—nevertheless the collections exist. The Museum of Princeton University possesses large and important collections of fossil mammals from Patagonia and our Western States, a good collection of North American birds and many examples of ancient and modern art. The Museum of Archaeology, University of Pennsylvania, has the best collection of Babylonian antiquities in America and is also particularly strong in America archaeology; also attached to the university is the Wistar Institute of Anatomy. To Amherst College belongs the Appleton Cabinet of fossil footprints, containing the specimens described by Prof. E. Hitchcock, and the University of Kansas is rich in Cretaceous vertebrates and large North American mammals. On the Pacific Coast Stanford University and the University of California both have museums; at present these are largely working collections, but both have art collections apart from these.

Among the most important as well as oldest museums under the control of scientific societies are those of the Academy of Natural Sciences, Philadelphia, and the Boston Society of Natural History; the first dating from 1812, the latter from 1831, although it was the successor of the Linnæan Society, founded in 1814. Each contains large collections of birds comprising many types of species described by our earlier ornithologists. A notable addition to the list of American scientific museums is the Museum of the American Indian, Heye Foundation, opened in New York City in 1922. It houses a remarkably complete collection of ethnological specimens relating to the American Indian, as well as the James B. Ford Library.

There are few museums in the United States

directly owned or administered exclusively by municipalities, as are public libraries, almost the only one being the Public Museum of the city of Milwaukee, but there are many to which the city has contributed or does contribute, either by grants of land, erection of buildings or annual appropriations for financial support, and there is a growing tendency toward this co-operation between city and citizens as the educational value and practical importance of museums are recognized. About 15 per cent of our museums belong in this class, including many of the largest and most active, the chief among them being the American Museum of Natural History.

There is, however, a large and constantly growing number of State museums, that of New York standing first, while those of Ohio, Illinois and Pennsylvania are most important. The scope of these State institutions is somewhat general, comprising natural history and history this latter being usually treated in a somewhat desultory way.

In the category of museums supported by endowment or by private funds and municipal aid are to be found all the art museums in the United States, not one having been established by the national government or that of any State. Local museums are practically lacking in the United States; for most of the smaller museums, even, make the attempt to cover the same ground as the larger institutions when they could achieve much better results by confining their attention to the immediate vicinity. In conclusion it may be said that while public museums are not so numerous in the United States as might be expected from the size, resources and wealth of the country, the last 25 years has not only witnessed a great increase in their number but in the growth and educational efficiency of those already established.

Bibliography.—For detailed information as to museums and their administration, cases labels and the arrangement of exhibits, consult 'Museums Association, Report of Proceedings etc.' (London 1890 to 1900); since that date 'Journal of the Museums Association' and 'Proceedings of the American Association of Museums' from 1907; the museums of the United States are listed in 'A Directory of American Museums,' published by the Buffalo Society of Natural History, 1910; those of Great Britain and her colonies in 'Directory of Museums in Great Britain and Ireland' (London 1911). For the history of the Smithsonian Institution, United States National Museum, classification and administration of museums, consult 'A Memorial of George Brown Goode' (Report of the United States National Museum for 1897, Part 2, Washington, D. C.).

Murray, D., 'Museums, Their History and Their Use, with Bibliography and List of Museums in United Kingdom' (Glasgow); Schuchert, C., 'Rise of Natural History Museums in United States' (addresses: Harvard Univ. 1926).

The volume of museum literature in the shape of reports, bulletins, general guides and special leaflets is today very considerable and many museums issue regular periodicals for the information of their sustaining members and the public.

FREDERIC A. LUCAS,
Director, American Museum of Natural History.

MUSGRAVE, William Everett, American physician: b. Farmington, Tenn., 12 Sept. 1869. He was graduated (1901) at George Washington University and became (1902-09) pathologist of the Bureau of Science at Manila, P. I., then chief of clinics and later director of the Philippine General Hospital and dean of the College of Surgery, University of the Philippines. He was (1903-04) president of the Manila Medical Society and (1905-06) president of the Philippine Islands Medical Association. He edited the *California State Journal of Medicine and Better Health*. D. 9 Mar. 1927.

MUSH, moosh, Armenia, the chief town of the Mush sanjak, vilayet of Bitlis, 79 miles south of Erzerum, near the Kara-su, the eastern affluent of the Euphrates. It is built on a plateau 4,800 feet above sea-level, rising on the south side of a mountain-girt and fertile plain. It is an ill-built, unclean town, peopled by Turks and Armenian Christians. It has Gregorian and Roman Catholic bishops and an American Protestant mission and schools. A thriving trade is carried on in the tobacco, grape vine, wheat and other agricultural products of the adjacent plain. Mush is mentioned by Xenophon and Moses of Khorene, and came into prominence in 1894, owing to the massacre of Armenians at Sasun in the neighborhood. Pop. about 20,000.

MUSHROOM, a popular term loosely applied to many species of higher fungi, especially such as have a cap (pileus) upon an erect stalk. Primarily, the mushroom is *Agaricus campestris* (see FUNGI), the only species cultivated upon a commercial scale. Though more than 700 species of mushrooms have been proved edible within the last half century, and though many others will doubtless be proved harmless, the novice should be cautious in trying new species. Each unfamiliar kind should be subjected to rigid examination first by smell, and malodorous ones discarded; then by taste, a small piece being nibbled but not swallowed. If no ill results follow in the course of several hours, a small piece may be swallowed. If no evil effects follow, but the flavor raw is unpleasant, cooked morsels may be cautiously tried, and results noted. Each individual must decide what species agree with him, because some systems will not endure kinds innocuous to others. Nervous fear of fancied bad symptoms must be controlled, or real illness may be induced by the imagination.

Several species are popularly reputed virulent which do not produce any marked effect upon the health for several hours, and which are widely feared as deadly. Since the two commonest of these (*Amanita muscaria* and *A. phalloides*) are often mistaken for the common mushroom, the novice should never gather any trusstools in the woods under the impression that they are the proper mushroom, which grows in pastures, lawns, etc., and not in shady places. Further, all species with yellow or white gills should be avoided until known to be edible. The common mushroom has pink gills when young, and purplish-brown or black gills when mature.

Several of the thousand species of the genus *Agaricus* are valued for food, but the common mushroom (*A. campestris*) is the most important. It is occasionally found in open and

grassy glades; never in the deep forest, but most frequently in old pastures and lawns, especially in autumn, but often when conditions are favorable during the summer. It grows about three inches tall, has a fleshy cap about three inches broad, generally white, sometimes reddish or brownish above and pink beneath. Its stem does not rise from a cup-like base as does that of *Amanita phalloides*. It is generally gathered in the "button" stage, that is, before the cap has expanded. Among its near relatives the best known is probably the horse mushroom (*A. arvensis*) which is much larger, whiter above, lighter below, the gills being white when young, but otherwise resembling the common species.

Success in mushroom growing seems to depend more upon the individual grower than upon the method, since two growers may each succeed equally with very different methods. The essentials seem to be decaying organic matter in abundance, uniform but not excessive moisture and equable rather low temperature. The most popular places for cultivating this plant are caves, abandoned mines and quarries, cellars, pits and similar places, where the temperature is naturally suitable or may be artificially controlled. The beds are usually made by spreading a layer of well-rotted manure and loam over a firmly packed deep layer of fresh horse-manure. After the violent heat of fermentation has passed and the temperature has fallen to or below 90° F., the mushroom "spawn" is planted. This spawn consists of the mycelium of the fungus in bricks (English) or flakes (French) made of equal parts of horse and cow manure and loam; it is a commercial article and its manufacture constitutes a business distinct from mushroom growing. After sowing, the bed is kept moist by mulching with straw or covering with mats which are replaced in about 10 days with a layer of loam about two inches deep. In America the mushroom is rarely cultivated out of doors; in Europe it often is, the temperature and moisture there being more favorable. It is frequently found growing wild in sufficient quantities to make commercial shipments profitable.

Besides the species already mentioned, several common American species are among the most desirable edible fungi. *Coprinus comatus*, the horse-tail or shaggy-mane mushroom, grows sometimes six inches tall, has a nearly cylindrical white shaggy cap with often black scales and white gills when young, but these turn black and liquefy with age. It is commonly found in lawns, waste places, rubbish heaps, etc., from midsummer until the coming of frost, especially after showers. *C. atramentarius*, the ink-cap, resembles the preceding in general appearance and places of growth. *C. micaceus*, the glistening coprinus, is a brownish species smaller than the preceding. It grows upon decaying wood. *Lepiota procera*, the parasol mushroom, and *L. naucina*, the smooth lepiota, grow in lawns, pastures and occasionally in gardens. They have white spores and a ring on the stems, to which the gills are usually not attached. *Cantharellus cibarius*, the chanterelle, grows about three inches tall, measures nearly as much across the cap, has an irregular top-shaped yellow or orange cap and has much-branched gills. It grows upon the ground in woods. *Maras-*

mus oreades, the fairy ring or champignon, is a small cream-colored or reddish species, which tends to grow in circles upon lawns and pastures. It is rather tough and solid, but is valued for its nutty flavor and its drying qualities. Its gills are alternately long and short. *Lactarius deliciosus* has an orange cap, an orange milky juice, and with age shows greenish tints where bruised. *Boletus edulis*, the edible pore-mushroom, has a yellowish or brownish cap, with convex tubes which change with age from white to greenish yellow. It is commonest in chestnut, pine, and oak woods during autumn. *Pistulina hepatica*, the liver-fungus, grows upon decaying wood, is stemless and of irregular form, red, succulent, and fibrous. It is often called beef-steak-fungus on account of its edible qualities. *Morchella esculenta* and several relatives, popularly known as morels, are of various colors, but usually grayish or yellowish. The top, somewhat resembling honeycomb, makes them easily recognized. They thrive in potash and are common where the land has been burned over or wood ashes have been thrown; also in orchards and woods. *Lycoperdon giganteum* and other species of puffballs, which are common in pastures, are considered among the best edible fungi if used while still white. They are more or less globular in form. The species mentioned sometimes attains a diameter of several feet.

Mushrooms are often said to be equal to meat in nutritive qualities, but these statements are not warranted by analyses, which show that fresh mushrooms contain about 88 per cent of water, 3.5 per cent of protein, 6.0 per cent of nitrogen-free extract, and generally less than 1 per cent each of fat, fiber, and ash. The protein content is therefore less than one fifth that of porterhouse steak, less than one third that of dressed codfish, and but little more than one fourth that of hens' eggs. Indeed, according to analysis, they seem to be inferior to most vegetables. Their chief value is therefore in their flavors, which vary with individual species as much as among higher plants. They are eaten by various animals (see FUNGUS-EATERS).

MUSIC. When Hans von Bülow boldly decreed: "In the beginning was rhythm," he took advantage of the prerogative of so many sayings: to be pithy and unfounded. Music is certainly older than rhythm. Music in its broadest sense is even older than melody; older indeed than any single element of the sounding complex that we call music today. It has no single root, no single cause; and all the "plausible" theories of philosophers about the origin of music are vain speculations.

Primitive World.—Music has taken shape by merging and developing a number of different human utterances, which we see distinctly in the life of primitive tribes; for "primitive" means being arrested on the cultural level of the Stone

Age. The Veddas of inner Ceylon, certain Patagonians, and other peoples recite their poems in what can hardly be called rudimentary melodies of only two tones a second or minor third apart and use them as little more than vehicles without much meaning of their own; Australians and American Indians burst into cascades of storming shouts and wails under the impact of strong emotion—cascades that slowly settle in musical intervals, leaps, and steps; and other peoples tend to organize their calls in regular fifths or fourths and their cries in shrieking trills. Even on the lowest level that the historian's eye beholds, the typical structure of modern songs evolves; indeed, the pygmies and their next of kin invent the strictest form of counterpoint, the canon, in which the leader and the chorus enter after one another with exactly the same short melody before the singer ahead has finished (as in *Frère Jacques* or in *Row, row, row your boat*).

Rhythm, the organizing power of human motion, does not join melodic expression at once. It reaches music essentially when bodily acts are made audible, when clapping, slapping hands or pounding feet unite the moving body with the singer's voice. Not alone does formal dancing create such a union; most early instruments—clappers, rattles, stamping tubes and, later, drums and xylophones—are extensions or projections of the moving limbs; they are rhythmic motion addressed to the ear. The ratio between the two elements—rhythm and melody—is different wherever we turn; rhythm, as the younger element, has an inferior role with many peoples, but in others is dominant enough to leave melodic expression far behind. The strongest example of such a dominance is probably the intricate, hardly decipherable polyrhythmic music of Central African drums, whose complicated patterns, syncopations, and offbeats tax the Western ear as other music seldom does.

In primitive civilizations, much more than in modern culture, music is connected with the daily life of the tribe. It has a leading part in all the manifold rites in pristine existence: birth, puberty, wedding, death, and the elaborate incantations for health, fertility, rain, resurrection, and victory. Every member of the tribe is expected to have a share in these musical activities, in singing, clapping, playing; and though some individuals may be more gifted and skillful than others and therefore sought as soloists, an actual specialization in a professional sense does not yet exist. But the collective and purposeful character of all this music around the fire or on the village square must not be mistaken for something merely utilitarian without aesthetic aims or standards. Whether most of it should be called art or not, is doubtful; the word has not been, and never will be, satisfactorily defined. There is no hard-drawn borderline between an art in the service of rituals and an art for the sake of self-expression or aesthetic delight. Despite the practical ends, the gusto with which the singers sing and drummers drum is very far from artless toiling. And the mere facts of a remarkable evolution even in the narrow limits of some tribal style and the often very careful polishing given to new inventions show the kind of individual contribution characteristic of any art in its own right.

Oriental World.—Oriental music or, better,

music in the high civilizations of Asia and the African North, differs from primitive music mainly in the emergence of professionals and of a well-ordered scientific fundament. The professional appears either as a bard—often blind—who sings the deeds of gods and kings at courtly banquets, or else as a well-trained member of one of the bodies of singers and players attached to the courts and the temples. The craft is often handed down to the sons and grandsons in Bach-like musical dynasties; or special conservatories take care of thorough, systematic education.

The Bible provides the classical illustration of the contrast between the primitive and the highly civilized world. In the books of Moses and the Judges, men and women of the people sing or play the lyre and the drum at celebrations; there is no mention of any professional. Indeed, when Saul, the king, was in need of soothing music to overcome his depression, he sent for David, then a shepherd, to play for him on the lyre. But the reign of David and Solomon marked the change: Levites were selected to dedicate their time and energy to performing the music in the temple, and when the House of the Lord was finished, it included a special school for 288 music students in 24 grades or classes "under the hands of their fathers."

Such planned education cannot be mere practice and routine. It presupposes a scientific basis: a musical grammar, a theory of rhythm, and a system of scales and steps and intervals. Music progresses to a conscious, methodical art and often attains some form of notation.

The music of the ancient Orient is practically lost. Only the cantillation of Orthodox Eastern synagogues, of Eastern Christian churches, and of Far Eastern and Hindu temples gives an idea of the religious music in antiquity; and much of the modern folk song in Asia and Northern Africa has obviously not changed in two or three thousand years. For the rest, we must rely on instruments dug from tombs, on reliefs and paintings of musical scenes, or on short allusions in contemporary texts. The situation is slightly better in the East—in India, China, and Japan, where the original nations and the original religions have survived—than in the West, where Islam and Islamic conquerors, and even Christian churches, have put an end to the ancient civilizations. No such break occurred in the East, and, much as some change in the current of three or more millenniums must be taken for granted, mutation has not been too significant in the otherwise unbroken tradition so characteristic of the East, as contrasted with that of the West.

Oriental music is probably at its best in India. Nowhere is it richer and more sophisticated. It has an unmatched number of different scales with five or six or seven steps per octave in finest gradation; an incomparable wealth of delicate grace notes without which, as the Hindus poetically say, a melody "is like a moonless night, a river without water, a creeper without flowers"; and above all, a subtly refined rhythm without actual stresses, which hardly ever assumes the all too straight and artless forms of our three-four and four-four rhythms. Melody is never entirely free; invention must accept the limitations of set patterns or *ragas*, in which a specific mood is expressed in some specific scale; and it also must accept the limitations of metrical patterns or *talas*, which are repeated through-

out a piece as are the metrical feet of a poem. So important is rhythm that the heading of a piece indicates both *raga* and *tala*, in the place where our music would write the key, as in Sonata C Major.

In India, as well as in the rest of the Orient, all music in a curious way is connected with extramusical concepts. Single notes, as well as scales and melody patterns, stand, as a logical outgrowth of Eastern cosmology, for the cardinal points, the planets, substances, cardinal humors, diseases, and parts of the day. Even now, in a time when all this cosmology is vitally weakened, a serious musician would hardly play a morning *raga* at night.

Extramusical connotations are most outspoken in the sacred music of China, where, for instance, the *Hymn to Confucius* must be transposed every month by a semitone, because the semitones are closely related with the months of the year. Otherwise, East Asia's music, strongly Mongolized, is less subtle and less varied than India's. It has, on the whole, not more than two scales, both pentatonic with only five steps in the octave. One of them contains two undivided minor thirds, and the other, still used in Japan, holds two major thirds side by side with two semitones. Rhythm, very far from the delicate sophistication of India's metrical patterns, is almost uniformly a crude 2/4 beat. And whereas India is prevalently given to chamber music, the Far East has, or had, full orchestras: the emperors of the T'ang dynasty (618-906 A.D.) kept among the many court orchestras one with more than 500 pieces and an outdoor band of 1,346 men.

Orchestral art is to this day the characteristic form of Indonesian music, foremost in Java and Bali. An orchestra, or *gamelan*, in most cases composed of well-tuned gong chimes and bronze slabs, plays as a rule a single melodic theme, very slowly on the lower instruments, at the same time much faster on the middle ones, and dissolved in fastest passages in the higher instruments, while deep gongs mark the regular ends of periods.

The Near East, or the Mohammedan world between Morocco and Iran, has a musical language infinitely closer to that of India. Rather than orchestras, it delights in smaller chamber ensembles that play in a free, individually modified unison. It has a great variety of scales and rhythms and follows the principle of compulsory melody patterns in which the contribution of individual composers is, compared with Western concepts, rather limited. As a striking difference in devising scales and patterns, Arabian countries have a predilection for a kind of temperament in which the two semitones borrow a quarter tone each from its neighbor below, so that, for example, the notes D E F do not form a whole tone D E and a semitone E F, but two equal three-quarter tones, which the Western ear finds hard to accept.

Greek World.—While there is a strong stylistic connection with India, Arabian theory has depended greatly on the writings of ancient Greece, for the authors of Hellas—musicians, philosophers, scientists—had left the most complete grammar of music as well as the fundamentals of acoustics, aesthetics, and music history. In these endeavors, as in musical practice, they threw a bridge connecting the East and the West, the Old and the Middle Ages.

The Greeks themselves used to acknowledge the Oriental origin of their music and were fully aware of the fact that not a single one of their instruments had a Hellenic name. Nevertheless, the ancient culture of Crete which they overran in their conquest around 1000 B.C. did give them the one most characteristic element: choral singing to praise the gods and accompany the solemn processions to holy shrines and oracles. Several hymns of this kind, to Helios, to Nemesis, to the Muse, are preserved among the dozen relics, notated on papyrus or engraved on stones in a letter script that we have learned to decipher without much difficulty. As a rule, rhythm was not marked; for the melodies followed the versification of the text so closely that, except for the end of a line, a long syllable carried a quarter note (in our terminology), and any short syllable, an eighth note. Thus, the music was just as dactylic, trochaic, or anapaestic as its texts. Even in the rarer and more complicated cases of five beats in one short and two long syllables, melody followed obediently and therewith achieved a peculiar airy charm. Only in one relic—a delightful drinking song—the letter symbols above the syllables of the text are supplemented by rhythmical dashes to indicate the length of each note, because the melody there is, in a way, independent of the text.

The Greeks, like the Orientals, had an impressive number of scales: a civilization without the shades of harmony must necessarily find the shades they need in the variety of melodic steps and their arrangement. The oldest, called *enharmonic* (against the modern meaning of the term), consisted of undivided major thirds and semitones, like the principal scale of Japan and probably related to it through inheritance from a common mother civilization somewhere in central Asia. Another one, *chromatic*, had minor thirds and whole tones. Most later scales were, like ours, *diatonic*, and yet so multiple in their structures that we hear of no less than 8 sizes of thirds, 7 whole tones, 13 different semitones, and 9 microtones smaller than semitones. Eventually, the confusing diversity was reduced by dropping most of the older scales and squeezing the rest into a simplified "Perfect System."

All these scales, or rather the melodies modeled after them, were, as everywhere in the Orient, interrelated with extramusical concepts. But different from the East, the connotations with planets, cardinal points, colors, or substances were ignored in favor of human moods and qualities, so that the ethos of a melody was mostly its way of affecting the character of man. For this reason, music became paramount in Greek education, and Plato even suggested—as Confucius had done in China a hundred years before—that the ideal state should be erected on the fundament of music.

Greek music has been misrepresented as an entirely homophonic art, with the instruments merely doubling the melody of the song. This is not correct. There was, of course, no harmony or counterpoint in a modern sense; but repeatedly Greek writers insisted on the beauty of simultaneous consonances and tell us about the independence of instrumental voice parts. This is important to know since it sheds new light upon the beginnings of medieval polyphony.

Middle Ages.—Rome, the homestead of the musical liturgy of the church, was the heir of

Hellenic music and passed its theory and certainly a part of its practice on to the Middle Ages. Anicius M. S. Boethius, who wrote in Rome the last work on music in antiquity, about 500 A.D.—long after St. Ambrose had created his Christian liturgy and probably after the earliest *schola cantorum* of the pope had been founded—was for a thousand years considered by the Western World the supreme authority in music.

The picture which early medieval music offers is incomplete and distorted, for only the monks were able to write; and ignoring the popular tunes outside the church and the abbey, the musicians among them wrote on nothing but sacred music. Thus we acquire too easily the mistaken impression that secular music was nonexistent in the early Middle Ages.

The music of the church was at first merely vocal, to be sung by the priest, a unison choir, and soloists; the church fathers had been opposed to instruments. It served mainly the functions of the Mass and of the daily offices from *matins* to *vespers* and *compline*. Its melodic idiom was originally that of the Jewish Temple, but it must have accreted a large vocabulary from all the Mediterranean countries in which Christianity took root. St. Ambrose, bishop of Milan in the 4th century, made the first attempt to fuse these often heterogeneous elements into a unified liturgy. But Pope Gregory I defeated him 200 years later with the somewhat different liturgy which became known as the *Gregorian chant* (q.v.), and which succeeded in becoming the nearly exclusive form of Catholic Church music. Its melodies are modal; the eight ecclesiastical modes which they follow differ in the position of the semitones within the octave and can be roughly reproduced by playing the white keys of a piano on A, on B, on C, and so on. The melodies have not changed to this day; but their original rhythm, never notated, was probably lost as early as the 11th century and is now replaced by an almost even length (of an eighth) given to every note.

We know scarcely anything about the secular music of the early Middle Ages, except indirectly, when at the end of the 11th century a novel, courtly style of poetry began to emerge and be set to music. The courtly poets must have availed themselves of a musical language long in existence—the language of folk song, of dances, and of professional minstrelsy. It is important to note that, unlike the musical language of the church, the many hundreds of melodies written down and preserved show a surprising prevalence of the modern major mode.

The time of this important courtly poetry lasted from about 1100 to about 1450. The movement was inaugurated by the troubadours in the south of France, resumed by the *trouvères* in northern France and England, and ended by the *minnesinger* of Germany between 1200 and 1450. Although by no means all of these composer-poets were noblemen, their attitude was aristocratic, dealing with fight and death on the battlefield, or with fervent religion and uplifted love. And their music—of which many hundreds of delightful melodies were written down in beautiful, illuminated collections—was simple and popular, but never vulgar. How much of this music was due to the poets themselves, and how much to minstrels in their service, is an open question.

While the knightly poets were riding from castle to castle to sing their *rondeaux* and *lais*, *ballades* and *virelais* (virelays), the church established the characteristically Western style of music, polyphony—the lawful progress of two or more simultaneous voice parts or melodies. Toward the end of the first millennium A.D., monastic treatises on music had begun to mention and to describe the *organum*: during the liturgy of feasts, the unison chorus alternated with a soloist, who sang his passage in long drawn-out notes to the accompaniment of another soloist, who followed note by note and usually at the distance of a fifth or a fourth below. This solemn if heavy and awkward form (today preserved in students' songs in Iceland) was decisively remodeled in the 11th century. Singers began to invert the two voice parts and to place the liturgical melody or *cantus firmus* below the accompaniment, which then became increasingly freer, opposed two and more notes against one of the *cantus firmus*, and attracted more and more the chief interest of the listener. Eventually, their roles, too, found themselves inverted: the former accompaniment had become the melody proper, and the *cantus firmus*, a mere accompanying voice or *tenor* (this word being taken in its older, literal sense of a held, sustained voice, from Latin *tenere*, not in the present meaning of a range between the alto and the bass). This free-melodic organum came to a first peak around 1150 in the musical bodies of two churches of France: St. Martial in Limoges and Notre Dame in Paris. In this connection, we face the earliest composer whose name has been preserved (except for a few nonprofessional clerics of the preceding century and some courtiers remembered for their poems rather than their melodies). Master Leoninus of Notre Dame in Paris left a stock of 90 two-part organa for the whole church year—florid free coloraturas soaring above the solemn, awesome, endlessly drawn-out pedal of the tenor. His successor, Perotinus, honored as Magnus (the Great) by his contemporaries, marked the climax and ultimate transformation of this form. In his gigantic three- and even four-part organa, the florid coloraturas were forced into the strait jacket of metrical patterns, such as iambs or trochees; but the tenor droned on in still more lengthened notes, with one of them often lasting for 40 or more bars. Only in certain episodes of the organum, the *clausulae*, did the tenor lose its inertia and moved along with the upper voices.

The *clausulae* became eventually the nuclei of the leading polyphonic form of the 13th century, the *motet*, which must not be confused with the very different motet of later times. It took its name from giving a special text (*motetus*) to the upper voice(s) different from that of the tenor (*mot*). Eventually, all voice parts had different if related texts, and even in different languages: the Gothic age was more concerned with spiritual than with sensuous unity.

A third polyphonic form was the *conduct*, with one text only and with its two, three, or four voice parts moving evenly on, note against note, in chordal columns that seem to have prepared the later harmonic conception of music.

In the theoretical field, musicians faced the gigantic task of devising a satisfactory notation and a system of accurate scales, together with

laws of consonance and dissonance in counterpoint and rhythmical rules, without which polyphony would result in chaos. The monk Guido d'Arezzo, in the first half of the 11th century, has been credited with most of these achievements and many others; but only few of them can be traced to his genius. His mnemonic devices to facilitate correct rendition of the liturgical melodies, the "hand" and solmisation, were Oriental; but his improvement in the field of notation was genuine. Music had been written down in *neumes*, a script of dashes, dots, and hooks above the syllables of the text that showed the up and down of a melody but neither its accurate notes nor their individual lengths. The neumes were sufficient as long as tradition was strong enough both in the Gregorian plain song and in folk music. It became intolerable when the growing role of polyphony required a degree of precision, both unknown and unnecessary in simple, melodic music. As a remedy, the dashes, dots, and hooks were given one, two, and—probably by Guido—a staff of four reference lines (still used in the prayer books of the Catholic Church) to place and space the neumes so unmistakably that their pitches were no longer left to guesswork or memory. It took 200 more years to establish the fundamentals of a metrical notation, in which the shape of the note indicated its relative length. This new measuring, *mensural* notation, created in the 13th century and slowly evolved from just a stemless breve and a stemmed long to an ever greater complication, was the link between the old unmetrical plainsong notation (again still used in Catholic prayer books) and our modern five-line staff notation, which was completed late in the 17th century. But as long as this notation was still mensural, it by no means conveyed unambiguous values: the longs, breves, semibreves could be perfect (that is, dotted) or else imperfect (not dotted) without showing it in their forms, and only the context, carefully parsed, would indicate which one was meant.

In the field of consonance and dissonance, the foremost problem concerned the (major) third—like C-E—and its complement within the octave, the (minor) sixth—like E-C. The "official," ecclesiastical music of the earlier Middle Ages had ignored them completely; its only recognized consonances had been octaves, fifths, and fourths. But in the Gothic period the third and the sixth began to spread from England to the Continent, although as late as 1300 the French still found them "hard on the ear." Their final recognition and adoption as the fundament of harmony occurred only in the 15th century. Apparently, the price to pay for accepting this new consonance was the renunciation of the older "natural" third provided by the cycle of fifths and the preference given to the just as "natural" third provided by stopped strings. But since the latter one, a bit smaller, consisted of two different sizes of whole tones (intolerable in polyphonic music), musicians around 1300 devised the earliest *mean-tone* temperament by dividing this smaller third artificially into two equal, somewhat shorter, whole tones.

The 14th century which we call *Ars nova* (misusing a contemporary term) as opposed to the *Ars antiqua* of the preceding century, ended the Middle Ages and was, as all ending periods are, particularly favorable to the evolution of music. Its outstanding traits, the awakening

interest in nature, man, and life on this earth, were faithfully reflected in the mirror of music. A sophisticated secular music arose alongside and often above religious music; rhythm grew ever more complicated; realism and descriptiveness appeared, as they did in painting and poetry; and the personal, individual contribution of the then well-known and admired composers became an important factor. In a host of names revered and beloved, two geniuses stand out as powerful peers: the Frenchman, Guillaume de Machaut (Machault, 1305?-1377), and the Italian, Francesco Landino (Landini, c.1325-1397), whose complete works are now available in modern editions. Besides many small-sized works for educated singers, Machaut is famous for having written a gigantic, megalithic Mass—the earliest complete Mass ever composed outside the Gregorian plainsong masses. The gentle Landino excelled in euphonious vocal chamber music with a remarkable anticipation of the harmonic, chordal trends of the future.

The main forms of this music for vocal soloists derived from dance songs, as their names imply: *rondeau* and *ballade* are connected with "round" and "ball." They also had refrains as remnants of the regular choral answers to the verses of the leader. The *madrigal*, on the contrary, though very different from the madrigal of the 16th century, had no connection with the dance and therefore no refrain. The most fascinating form, however, was the *caccia* (chase), in which two singing voices in strictest canonic imitation depicted convincingly and with dash and humor some scene from everyday life, the sports of fishing and hunting (whence the name), or breathless market scenes and fire alarms, with all the trimmings of shouting, galloping hunters and barking dogs, of sellers, quacks, and bargaining customers, in a fresh, delightful naturalism despite the strictest musical form.

Later Ages: 1400-1900.—Early in the following century, the accent shifted from Italy to the north. One center was England with the vigorous personality of John Dunstable (1370?-1453), who traveled on the Continent and, in a fruitful give and take, accepted the latest achievements of France and Italy, but left in turn to his Continental fellow composers the heavier, compact style of England with its thirds and sixths.

The other center was the brilliant ducal court of Burgundy in eastern France with the great Guillaume Dufay, a master of highest skill and of a charming serenity reminiscent of the contemporary painter Jan van Eyck. Dufay (1400?-1474) was one of the first musicians from the north to wander to Italy and serve in one of the select chapels of Italian princes—the leading bodies of Renaissance music. For 150 years, the great composers from the north often spent decades of their lives in Rome or Venice, Florence or Mantua, while Italy, absorbed in giving to the world the glorious treasures of her visual arts, did not produce musicians of the highest rank. And yet, the general atmosphere of the Italian Renaissance which the masters from the north imbibed at the courts of the pope and the Medici, the Este and the Sforza, changed their traditional ways. The Gothic spirit of the north, complex and angular, yielded to the new taste from Italy, to rounded lines, to restful balance, and to limpid simplicity.

The Burgundian school came to an end around 1460. In the following 100 years, its

place was taken by men from the Netherlands who founded the Flemish School. The two great names of the first generation were: the Fleming, Jean d' (Jan van) Okeghem (1430?-1495), and the Dutchman, Jacob Obrecht (1430?-1505). They inherited the typical plan of Burgundian writing: three voice parts with the principal melody above, a similarly melodic tenor below, and a so-called contratenor which, as a sign that harmonic conception was gaining, filled in the notes necessary to form triads with the cantus and the tenor. Okeghem and Obrecht took a further step in this direction; they increased the number of voice parts to four and five and also ended not a few of their pieces with full triads instead of the customary open, empty fifths. They also widened the span of melody as against the short-winded sectionalization of the Burgundians; they did away with the subordinate contratenor and assigned roles of equal importance to each of the voice parts. Indeed, they stressed their equivalence by making them enter after one another with the same theme and thus drew the listener's attention to each one.

This "imitative" style reached maturity at the beginning of the 16th century in the generation of Josquin des Prés (c.1445-1521) and Heinrich Isaak (1450?-1517), the two Flemings whose full and mellow-sounding works in soaring, balanced lines were the true counterpart of the visual High Renaissance in the age of Leonardo da Vinci, Bramante, and Raphael. In their emphasis on chords, the two great masters also marked the progress of harmonic feeling and therewith the critical turning point—unique in the history of music—from a *horizontal* to a *vertical* conception. While the older masters had written the voice parts horizontally, at first the tenor and then, after one another, the cantus and the contratenor, they now began to work vertically, considering all the notes perceived at the same moment as consonant or dissonant chords, which had to be connected and resolved according to the nascent laws of the novel art of harmony. One contemporary theoretician, Pietro Aaron (c.1485-1545), emphasized what a very difficult thing the new vertical composition was and how long a training and practice it required.

We should not leave this critical turn without a look at the strange "artifices" of the Netherlands which had to disappear together with the fading prevalence of absolute counterpoint. As a matter of fact, these artifices had started in France during the 14th century. They consisted mainly in writing down a single line of notation and deriving from it a whole polyphonic web by reading it at its face value, or backward, or upside down, or in different rhythms and tempos. It would be a purely romantic misconception to call such principle soulless and without imagination. Rather, it represented the truly Gothic principle of building a whole cathedral out of a small, half structural, half ornamental nucleus in order to achieve a maximum of organic unity and, at once, to enjoy the craftsman's feat in so doing.

Late Gothic polyphony reigned in Germany also. Still, the German scene was decisively shaped by Luther's Reformation. With the Protestant aim to make the congregation lead in singing, the musical circles around the reformer strove for monumental simplicity and popular character and hence converted Gregorian hymns and an old stock of secular folk songs;

ften with risqué texts, into vigorous, solemn *honorales*.

In music, as well as in Bible lore and propaganda, the Protestant Reformation was highly indebted to the recent invention and improvements in printing and publishing, which had within a few decades enlarged its scope to include music. Owing to the activities of music printers, particularly in Nürnberg, Venice, and Paris, we know much more of popular and semipopular music around 1500 than of that in earlier times. (Publishers of course preferred these better-paying genres to the more esoteric forms of music.)

Outstanding among the half-courtly, half-popular forms was the Italian *frottola*, a lyrical solo song with an accompaniment either sung or played, and mostly set in harmonic chords rather than in contrapuntal voice parts. Out of this well-wrought but simple form in which the minor masters excelled, the major masters around 1530—Italian and Flemish—derived the most important secular form of Italy in the 16th century, the *madrigal*. Idyllic or erotic, free in structure, and highbrow in text and musical diction, it was a basically vocal chamber music to be sung by cultivated amateurs around a table, with the voice parts laid out before them. The madrigal lasted in Italy until early in the 17th century in an evergrowing harmonic sophistication and—like our modern chamber music—passed more and more into the hands of professional singers.

The French did not import the Italian madrigal. Instead, they created their own brand of vocal chamber music by raising the age-old form of their erotic *chanson* to a climax of delightful, melodious, airy, and elegant writing. Paintings of the time show such chansons performed by a single voice with instruments taking over the other three voice parts.

In the 1560's, however, a number of French composers and poets turned their backs upon this charming, though frivolous genre and wrote the deeply passionate psalms for John Calvin's Protestant circles. These were intended to be sung at home after dinner—again around the table—since the Huguenot Church itself admitted no artful settings beyond the sober unison of the congregation. The two great leaders in this field were Claude Goudimel (c. 1505; assassinated during the Massacre of St. Bartholomew, 1572), and Claude Le Jeune (c. 1530–c.1600).

Le Jeune's characterization by contemporaries as "the last polyphonist" hints at a momentous turn in the history of music. The era of Flemish influence was drawing to a close with the most brilliant and versatile master from the north, Orlando di Lasso (Orlandus Lassus, 1532?–1594) from Hainaut, who lived in the Netherlands, Italy, England, France, and Germany. Honored as no musician had been before him, and even knighted by both the emperor and the pope, he left a truly cosmopolitan work, using texts in four languages—more than 2,000 pieces, among them more than 1,000 motets, 100 settings of the Magnificat, not to count his masses, psalms, chansons, and German lieder.

The end of Flemish supremacy implied the rise of Italy as the leading power in music. Almost at one blow, the Italians took possession of all the princely chapels, including the organs of important cathedrals. But long before the pioneers were able to replace the Flemish polyphony by a national idiom, an Italian marked the transition from a Flemish to an Italian character in

the very field of Flemish influence, the polyphonic music of the church. This master of unforgotten world renown was Giovanni Pierluigi da Palestrina (1525?–1594), the counterpart of di Lasso and his exact contemporary. To the Fleming's versatile mind and cosmopolitan way of life he opposed a glorious one-track mind and the strictest localism. He spent his life in Roman churches as the pope's composer, conductor, or singer, and wrote almost exclusively for the masses and offices. In this capacity he succeeded in creating a style in which solemn grandeur, celestial serenity, and mystic profundity became the paragon of Catholic music. As a son of his time, he often blended these qualities with the then recent custom of writing for two or three choruses which, now alternating, now mingling, reached the listener's ear from various sides or even floors of the church, and gave him the feeling of space that was so dear to the baroque.

England approached the musical ideals of Italy more closely than did any country in Europe. It is not without good reason that the greatest master of the time, William Byrd (Bird, 1540?–1623), has been called the British Palestrina. Three great T's, representing Tudor music, had preceded him: John Taverner (1495?–1545), Christopher Tye (1497?–1572), the creator of the English Church anthem, and Thomas Tallis (c.1510?–1585), who emulated the latest Italian style in a Latin motet for no less than 40 voice parts grouped in eight choruses. Byrd, however, did not confine himself to sacred music. He bowed to secular needs in "Songs of sundrie natures, some of gravitie, and others of myrth, fit for all companies." He tried his hand at British madrigals in Italian style (1588) and thus inaugurated an extraordinary if belated flourishing of the madrigal in England—the only soil on which this delicate form could thrive outside of Italy. But he also was the father of that brilliant school of keyboard music known as the Elizabethan Virginalists. Thus far, instrumental music had nowhere equaled vocal music in quality, importance, or number. The groups of court musicians who played at banquets and other festive occasions had preferred, way down to 1600, the instrumental rendition of vocal music, of motets and madrigals, now on strings, now on woodwinds or brasses. Still, the players were trying hard to find an idiomatic language of their own, at least for organs and virginals (harpsichords), for viols and lutes. Small instrumental forms had arisen from dance tunes and from improvised preludes in the accompaniment of songs, mostly as variations of some given theme. But the charming character pieces and variation sets of the Elizabethan Virginalists, of Thomas Morley (1557?–1603) and Giles Farnaby (c.1560–c.1600), of John Bull (1563?–1628) and Orlando Gibbons (1583–1625), were the first far-reaching successes and the seeds from which our piano music stems.

Tudor musicians also created the *consort*, which comprised instruments either of the same family (unbroken consort) or of various families (broken consort) and represented a basically polyphonic music midway between chamber and orchestral music. In a similar spirit, the Italians began to make instrumental ensembles independent of vocal music. Most daring among them was Giovanni Gabrieli in Venice (1557–1612). He even transformed the magnificent polychoral style of Venetian state motets (settings for sev-

eral simultaneous choruses) into what he called sonatas for several groups of instruments with—as something completely new—the exact orchestration carefully prescribed and, as another novelty, with painstaking indications showing which passages should be played forte, and which piano.

While this happened in Venice, Florence took a different step in revolutionizing music. The fight against the artificial, "barbarian" polyphony of the Netherlanders availed itself of erudite weapons from the knowledge (and misconception) of the truly classical music of ancient Greece. The result was a new ideal, different however from those of the Greeks: the generation born in the 1560's created a speechlike, naturalistic *monody* able to express man's moods and passions to the degree of illusion and completely free from regard for structure or counterpoint. This kind of monody rested solely on a *basso continuo*, or thorough bass, which, by a code of added figures, indicated what chords the lutes or keyboard instruments should improvise between the melody and its bass.

The new monodic style, mature around 1600, produced at once a number of unprecedented forms. It led almost inevitably to the *dramma per musica* or opera (q.v.), which arose in the 1590's and reached its earliest peak in 1607 with the immortal *Orfeo* of Claudio Monteverdi (1567–1643). This presented a number of episodic dances, instrumental pieces, and choruses, but rested essentially upon a naturalistic recitative full of dramatic tension. For about 40 years, such operas were rare events; they were written as courtly entertainments for some princely wedding or reception in Florence or Mantua and were scarcely repeated after a single performance. To a great extent, the opera preserved this aristocratic exclusiveness way down to the 18th century; but as early as 1637, Venice, the courtless city-republic, opened the first, and for decades the only, public opera theater (the Teatro San Cassiano) for subscribers and those who paid for admission.

At about the same time, clerical circles introduced a cousin of the opera, without stage settings, costumes, or action: the oratorio. Taking the name from its earliest place of performance, a Roman prayer chapel or oratorio, it based its text on some epic theme from the Old Testament and was sung by soloists and a narrator with choral and orchestral episodes, "in order," as a contemporary listener said, "to attract the faithful and to entertain them with spiritual profit in those hours of the night which in the fall and the winter are the most dangerous, above all for youngsters." Another cousin of the opera, the *cantata*, a set of contrasting lyrical arias alternating with recitatives, was still shorter in size. Both forms owed their first perfection to the Roman, Giacomo Carissimi (c.1604–1674).

Arias as integral parts of the cantata testify to a vital change in Italian taste after 30 years of speechlike melody. Toward the middle of the century the unavoidable "tedium of the recitative" to which the Italian masters of opera and kindred works openly confessed, and the innate need of attractive melody and balanced form caused these composers to interrupt the "unending" flow of the recitative by lyrical episodes written in a truly melodic style and a symmetrical form (such as the universally known Largo by Handel). Most of them were so-called *da capo* arias, in which, after a second, contrasting section, the

first was repeated *da capo* (from the beginning). More and more the aria dominated, indeed it domineered and therewith weakened the dramatic, driving force of the Italian opera to the benefit of vainglorious divas and *castrati*. This defection from the original ideal of the opera was enhanced by the increasing influence (and salary) of the stage engineer, who devised increasingly sensational tricks of transforming settings, wings, and props before the eyes of the audience, and of arranging surprising appearances of gods and demigods from the skies or the ground—the notorious *deus ex machina*.

Slowly, the Venetian opera yielded to the so-called Neapolitan opera, whose founders were Francesco Provenzale (d. 1704), and the patriarch, Domenico's father, Alessandro Scarlatti (1658 or 1659–1725), with 115 operas. A galaxy of brilliant names followed, among them Niccolò Porpora (1686–1766), Niccolò Jomelli (1714–1774), and Niccolò Piccini (1728–1800), way down, in the 19th century, to Giovanni Paisiello (1740–1816), and Domenico Cimarosa (1749–1801). In the Neapolitan opera, we look in vain for machines or showy settings. The singer reigned supreme and, with the singer, the form of the aria at the cost of recitative, choruses, and instrumental music. The prevalence of the aria reduced dramatic, driving action to a minimum; the interest shifted to melodic charm and coloratura technique.

As an antidote against the pomp and showiness of the various schools of opera, the Italians built up an impressive chamber music of intimate character—sonatas for one or two violins with bass and harpsichord, as an instrumental version of the vocal monody, and *concerti grossi*, where a trio of bowed solo instruments detached itself from the background of a string orchestra or *grosso*. The pioneer in the realm had been Salomone Rossi, sometimes called L'Ebreo (c.1565–c.1628); the fulfillment came with Arcangelo Corelli (1653–1713) and Giuseppe Torelli (1650?–1708), who probably wrote the first concertos for violin and orchestra.

Once more, England was Italy's next of kin. Her greatest master in the 17th century, Henry Purcell (c.1659–1695), most famous as the composer of brilliant anthems and hymns for Westminster Abbey, wrote beautiful violin sonatas in Corelli's style and even an actual opera, *Dido and Aeneas*, which differed from Italian models basically in the important role allotted to the chorus. Otherwise the English court preferred the time-honored ballet-like *masques*, and the public stage which featured the spoken dramas of poets and like Dryden and a corrupted Shakespeare with elaborate incidental music.

In France, the opera had similar difficulties; the court clung to the semidramatic form of the traditional court ballet, and an attempt to introduce a public opera ended in bankruptcy. Only in the 1670's, an Italian-born musician of the court, Jean Baptiste Lully (1632–1687), succeeded in adapting the opera to the taste of France and rooting it firmly in the soil of his new country. Lully's operas were once more musical dramas in the original sense. The master ignored the recent antidramatic development in which a dried-up recitative contrasted overdecorated lyrical arias. Instead, he reestablished an eloquent monody which, never dry and never florid, was carefully modeled in its accents and meters after the diction of leading actors in the Comédie-

rançaise. Complying with the national respect for correct and meaningful diction, he also complied with the national delight in dramatic or lyrical nature, as in thunderstorms, enchanted gardens, or moonlit nights. This was a rewarding task for the instruments. And indeed, as in all dramatic phases of operatic history (Monteverdi, Gluck, or Wagner), Lully's orchestra was given an eloquence and significance that the contemporary opera of Italy had completely lost.

Lully's counterpart in the field of intimate chamber music was François Couperin, surnamed the Great (1668-1733). His thoroughly aristocratic, delicate concertos for strings and pieces for harpsichord anticipated in a way the fragile elegance of the coming rococo.

Germany was just as late as England and France to adopt the opera. A place of honor belongs of right to the German lied, which kept an age-old tradition of intimate, tender, and often popular singing and grafted it on the novel Italian form of accompanied monody. Three names may stand for three generations: Heinrich Albert (1604-1651), Adam Krieger (1634-1666), the greatest among them, and Johann Wolfgang Franck (1641-c.1700), the master of the religious lied.

While these men had on the main a national significance only, the name and work of Johann Crüger (1598-1662) spread all over the Protestant world. His *Praxis pietatis melica*, with many well-known hymn melodies, was printed and reprinted for a hundred years in some forty editions from 1644 to c.1744.

But long before the opera, Germany had accepted the new monodic style for nontheatrical purposes. Under the vigorous leadership of Heinrich Schütz (1585-1672), the Protestant Church had taken advantage of the passionate intensity of free-flowing recitativic melodies to render the words of the Scriptures with all the might at music's command. It also had availed itself of the grandiose partnership of two or more choruses which Schütz had learned in Venice as one of the many students of Giovanni Gabrieli. But beside this strong Italian influence, the German Lutherans kept their faith in their own heritage, the chorale, and tried to exhaust its musical and spiritual wealth in polyphonic settings, cantatas, and organ phantasies. The latter had their greatest three masters in the organists, Samuel Scheidt (1587-1654), Johann Pachelbel (1653-1706), and Georg Böhm (1661-1733), while the church cantata for soli, chorus, organ, and orchestra reached its highest pre-Bachian peak in truly baroque compositions of Dietrich Buxtehude (1637-1707).

Here and there a few of the many royal, ducal, and princely courts in the country would import an all-Italian cast to provide a more or less brilliant imitation of the glamor of French and Italian courts. Very few availed themselves of native talents. Eventually, the Italian situation repeated itself in Germany: as the richest commercial center created a public, permanent, national opera; what had happened in Venice 1637, recurred in Hamburg 1678. Johann Theile, following the taste of patricians, preferred Biblical subjects from the Old Testament. But soon the management yielded to pressure from below and led the opera down to a level of vulgarity never reached before and hardly later. But in doing justice to this strange institution, we must underline that it attracted a number of high-ranking

masters: Reinhard Keiser (1674-1739), Johann Mattheson (1681-1764), and young Handel (1685-1759) before his Italian years and his residence in England.

All these masters, Italian and German, English and French, all great in their own right, built the imposing edifice of baroque music which the memorable masters born in 1683 and 1685 completed and roofed. Their unforgettable names are Jean Philippe Rameau (1683-1764) in France, George Frederick Handel (1685-1759) and Johann Sebastian Bach (1685-1750) in Germany, and Domenico Scarlatti (1685-1757) in Italy.

The cosmopolitan Handel lived in Germany and Italy, and longest, in England, which became his adopted country. He wrote a German Passion and some German operas, much chamber music in the style of Corelli, and some 40 Italian operas in the so-called Neapolitan style with arias as the backbone of the scores. He also wrote *Te Deums*, anthems, and cantatas in the English style of Purcell. But his universal fame was based on the monumental London oratorios which, far from Carissimi's short devotional works, were gigantic in size and in means, and designed for gigantic audiences.

Bach, on the contrary, having spent his entire life in Saxony, now as an organist, now as a court violinist, conductor, cantor, or teacher, was deeply rooted in the polyphonic and chorale tradition of his country. His interest was by no means limited to this tradition. Again and again, he allowed himself to be fascinated by the charm of French orchestral music and of Antonio Vivaldi's (1675?-1743) brisk homophonic concertos. He studied them thoroughly, and adapted their style to his personal needs. And yet, the center of Bach's incomparably wide-reaching art was the fugue, all the way from the 48 preludes and fugues of the *Well-tempered Clavier*, through the almost superhuman choral fugues of the B-minor Mass, to the last apogee in the *Art of Fugue* which death did not allow him to finish. With the enormous span of his life work, from the esoteric violin sonatas to the gigantic *Passion According to St. Matthew*, from the good-humored miniatures of the *Klavierbüchlein* to the church cantatas, he avoided the two fields in which Handel was at his best: the opera and the oratorio (Bach's six Christmas cantatas, bundled together, form an oratorio only in name).

Domenico Scarlatti, who shared the year of his birth with Handel and Bach, wrote many hundreds of short sonatas in an unprecedented, antipolyphonic style. "Good-humored and spirited, limpid and light-footed, they were short and free in form, changing in tempo, and thoroughly and exclusively harpsichordistic, with glittering arpeggios, audacious leaps, crossed hands" (Sachs). Indeed, Scarlatti created the principles of modern piano music.

In Rameau, the eldest of the four, we revere the father of the modern system of harmony (*Traité de l'Harmonie*, 1722). Yet in his fifties, the one-time organist turned to the stage and became, after André Campra and André Cardinal Destouches, the most influential successor of Lully as the leader of French opera and the precursor of Gluck.

Again we find ourselves in the middle of a revolution, not after, but during, the lifetime of Handel and Bach. Sociologically, this revolution becomes manifest in the change of patronage. Up to 1700, the church, both Catholic and Protestant,

and the courts with the higher aristocracy had been predominant, although by no means exclusive, patrons of the arts. They were losing their interest (and taste) in the 18th century and left them more and more to the ever-rising middle class. The two main symptoms of this change were the beginnings of professional criticism and of public concert life.

The earliest critical columns can be found in the *Mercur de France* and in the two London papers *The Tatler* (1709) and *The Spectator* (1711-1712). Germany followed soon with actual music magazines, most of which were short-lived but showed a growing need for open discussion and clarification of aesthetical questions.

Public concerts were started in England. They began in 1672 under the leadership of John Banister in a comparatively small room with "a large raised box for the musicians, whose modesty required curtains," and were continued by Thomas Britton, "the musical small-coal man," in a loft over his coal-storing warehouse. In Germany, the composer Georg Philipp Telemann followed with concerts in Frankfurt and Hamburg, and in Paris, Anne Philidor founded the famous *Concerts spirituels* in 1725.

Musically, the revolution of the early 18th century becomes manifest in a thorough reaction against the trends of the late baroque. Again polyphony is scorned as stiff, pedantic, soulless. Again a limpid if often meager melody accompanied by a bass is the goal. The two general trends of the time centered on the aristocratic rococo, in music called *le style galant*, which reacted against the grave and heavy ideals of the baroque, and the leanings of the maturing middle class, which demanded simplicity and human warmth. Polyphony was not the only victim. Another was the traditional opera of the Italians, or one composed in their style and language, with their stilted and ever more ridiculous Alexanders, Caesars, and Neros, so pompous and remote from actual life when they sang their endless arias. From the 1720's on, lampoons attacked it; but the decisive victory came when John Gay and, as a musician, John Christopher Pepusch, performed the *Beggar's Opera* in London (1728), a play half spoken, half sung in catchy, popular tunes, full of wit and satire, and unafraid of vulgarity. Partly dependent upon, partly independent from, the *Beggar's Opera* and its followers, Italy responded with an *opera buffa*, of which Giovanni Battista Pergolesi's *La Serva Padrona* of 1733 is the immortal example. In France, the musician-philosopher, Jean Jacques Rousseau, imitated the *Serva* with his unbelievably successful and harmless *Devin du Village* (Village Seer, 1752); and in Germany, after many failing imitations of the *Beggar's Opera*, Johann Adam Hiller founded the *Singspiel* in 1766, which, like its foreign paragons, had its scene laid in the present, a simple if not naive text and a thoroughly popular music. Weber's *Freischütz* (1821) was fundamentally a *Singspiel*.

The heroic opera was, however, not dead. It reached another peak with Christoph Willibald Gluck (1714-1787). Gluck was no leftover from bygone times. He—with his librettist Raniero da Calzabigi—was a bold reformer who once more took up the dramatic ideas of Monteverdi and Lully. In the preface to his opera *Alceste* (1767), he wrote: "... I have striven to restrict music to its true office of serving poetry by means of expression and by following the situations of the

story." The very subjects of his operas, like *Orfeo ed Euridice*, *Armide*, and *Iphigénie*, show the departure from the historical themes of the later Italians and the connection with Monteverdi and Lully.

The revolution toward a sincere, expressive, natural art, was accompanied by a thorough change in performance. While previous centuries had taken advantage of forte and piano in the best of cases only in the form of a contrast between sections loud and soft, the 18th century began, still timidly, to seek an unprecedented method of expression in a crescendo and decrescendo connecting the two extreme intensities. Instruments paved the way: the years around 1710 saw the invention of the modern piano with hammers, in Italy, France, and Germany, and of the earliest organ swell in England, all of them capable of such expression. At the same time, around 1711, orchestras in Rome began to diminish the "tone little by little, and then return suddenly to the full power." But it took more than a generation to bring this new achievement to France and to Germany. When Rameau wanted it in his ballet *Zaïs* in 1748, he had to describe rather than to indicate in the score what he wanted the instruments to do, and the German Johann Joachim Quantz, did not even mention it in his treatise on performance in 1752. The crescendo triumphed only when the Italian Niccolò Jommelli (Jomelli, 1714-1774), brought it to the court orchestra of Stuttgart, and the latter handed it over to the orchestra of Mannheim on the Rhine, which, under Johann Stamitz (1717-1757) and Christian Cannabich (1731-1798), well known from Mozart's letters, had become the world-famous center of symphonic music.

Stamitz and another Mannheimer, Franz Xaver Richter (1709-1789), had begun to shift the symphony to the center of concert life. But it was Joseph Haydn (1732-1809) who, more than anyone else, raised the symphony, together with its formally similar cousins—string quartets, trios, and piano sonatas—from a tasteful entertainment to an eloquent, moving expression of human fate and character. His sonata had, as a rule, four movements: a playful and joyous first, a dance-like third, and an introspective warm-hearted second. The first movement was dramatic, driving, exciting. To provide dramatic contrast to the leading theme, Italian in Pergolesi's time had already introduced a second, lyrical theme; Haydn himself perfected this so-called development, "in which the themes no longer treated as integers, were decomposed into characteristic fragments or motives which had enough motorpower to drive ahead. The theme no longer was; it acted" (Sachs). This Haydn first achieved in his string quartets (notable is his *Jungferquartette* or *Maiden Quartets* of 1781), which, side by side with his 104 symphonies, form the bulk of his enormous life work. In its increasing depth and significance, Haydn music is a symbol of the composer's changing position. He still enjoyed the patronage of an aristocratic house as a court composer, eager to write all the ever new music required by his service. But as a pensioner, he marked in his older age the momentous passage from an employed, though highly respected servant of the 18th century, to the free-lance writer of the 19th century, who dared express himself and his personal struggle.

Wolfgang Amadeus Mozart (1756-1791) had broken down under the impact of this social crisis. As a young man he had left the security of a court musicianship was never able to find their employment, and paid for his daring with a short, pitiful life in poverty and burial in a potter's field. Still, smiling under tears, he created an almost unbelievable wealth of works in all the fields of music, from songs to operas, from piano pieces to symphonies. Even within the opera, he covered the whole expanse from the Italian *buffa* and *seria* to the German Singspiel. He not only mastered the styles of Germany, France, and Italy side by side; he integrated them into a higher, supranational whole. "Reconciling beauty and character, German and Italian spirit, the tragic and the comic, drama and music, voices and instruments, melos and counterpoint, he was graced in a blissful moment of history to hold the scales of style in perfect balance" (Sachs).

When Mozart passed away at the age of 35, with his *Magic Flute* completed and a Requiem left as a torso, Ludwig van Beethoven (1770-1827) was coming of age. Beethoven's works seldom smile and rarely cry; they sometimes laugh; but most often they show the superhuman vision of a hero fighting for peace, perfection, and truth. More than Haydn or Mozart, Beethoven expressed himself, his suffering, and his struggle; but unlike the romantics after him, he elaborated and remodeled his works in a long process of transformation until they had left the stage of personal confession and attained an all-human sublimation. Beethoven was the first composer who (his boyhood excepted) did not accept or even desire a fixed position in life. And he was the first who wrote comparatively little on commission for some demanding master or church. Thus he left one single opera (*Fidelio*, 1805-1814) against the 20 of Mozart's, 9 symphonies against the more than 100 by Haydn, one violin concerto against Mozart's 6. But each work stands in its own right, in a vein and a form of its own. And probably for the first time in history, his last works, among them the three last, esoteric quartets of 1825-1826, were couched in a language beyond the comprehension of the contemporaries and had to be rediscovered in later decades. The fatal divorce of "modern" composers from their contemporary audience had set in.

This is why the immediate influence of this giant was less than we should expect. It was nonexistent in the operatic composers of his time, of whom only the four most important may be mentioned. In Paris, Étienne Méhul (1763-1817) kept the noble tradition of French opera alive; also in Paris, and later in Berlin, the Italian, Gasparo Spontini (1774-1851), revived the heroic opera in the wake of Gluck but led it eventually down the path of soulless showmanship; all over the Old World and the Continent, the Italian, Gioacchino Rossini (1792-1868), began to enchant the opera fans with the sweetish melodies and neck-breaking coloraturas of his operas; and in Germany, Carl Maria von Weber (1786-1826) raised the German Singspiel in his *Freischütz* to heights that it had never achieved before. In the great works of the 1820's, *Der Freischütz* (1821), *Euryanthe* (1823), and *Oberon* (1826), Weber firmly established the romantic opera with, poetically, its predilection for mysterious extrahuman powers and, musically,

its stress on descriptive harmony and orchestration as the essential elements of dramatic expression.

The only composer who had some affinity with Beethoven was Franz Schubert (1797-1828). Still, he was of a younger generation and therefore a full-fledged romantic, fond of streaming melody and the beauty of sheer sound, and always ready to change with a few significant chords from bliss to tragedy. And as a romantic, Schubert allowed the smaller forms an equal place with the large ones. To be sure, he wrote extensive chamber music and, like Beethoven, nine symphonies, including the "heavenly endless" one in C major, but he gave much of his best to the *Impromptus* and *Moments musicaux* for the piano. Even from the splendor of his trios and quartets, the music lover comes back again and again to the 603 lieder, which one would call divine if they were not so movingly human.

The first period of German romanticism ended with the two great masters born in 1809 and 1810. Felix Mendelssohn-Bartholdy (1809-1847) was a romanticist in his inspiration and choice of topics. But in his musical language he was a strictly classicistic master educated on the works of Bach (whose *Passion According to St. Matthew* he rediscovered exactly a hundred years after Bach had written it in 1729) and thoroughly averse to exhibiting personal feelings and conflicts. But even with his adherence to strictest form, he delighted in the miniatures of his *Songs Without Words* for the piano. His unhappy friend, Robert Schumann (1810-1856), was in orchestral, chamber, piano music, and lieder much closer to Schubert and probably even more romantic (the word taken in its German sense) in the sudden change from overflowing enthusiasm to longing and sadness. But, unlike Schubert, he found his principal medium in the piano. Exclusively pianistic was his nearest contemporary, the Franco-Pole, Frédéric Chopin (1810-1849), to whom the keyboard was the faithful beholder of his dreams and visions; and almost exclusive was his fondness of short character pieces, now sad, now chivalrous, now in the stricter forms of dances, now in the free improvisation of ballades.

No greater contrast to these delicate masters could be found than Hector Berlioz (1803-1869), the arch-romantic of France who, disdainful of smaller, intimate forms, of chamber music and the piano, expressed himself, and only himself, with all his nightmares, in fantastic symphonies and choral works of huge dimensions and unprecedented orchestral colors.

Romantic opera developed meanwhile along three principal roads. Paris produced in 1828 the novel *grand opéra*, of which Eugène Scribe (1791-1861) became the principal poet and Giacomo Meyerbeer (1791-1864) the chief composer. Brilliant and showy, with ballets and clattering marches, enormous ensembles and sensational deaths, it appealed to the eyes as much as to the ears. In Germany, an expressly so-called romantic opera under Heinrich Marschner (1795-1861), with supernatural powers, cursed heroes, and final redemption, led straightway from Weber to Wagner. In Italy, where romantic trends in the French and German sense were weakest, the opera, with Gaetano Donizetti (1797-1841) and Vincenzo Bellini (1801-1835) in the lead, maintained the old Italian concept of being mainly a vehicle for sensuous, beautiful singing.

Shortly before 1850, when the new generation of 1811 to 1813 had matured, romanticism was entering a second, naturalistic phase. This meant to music, not renunciation of magic potions, curses, gods, and redemption, but rather the illusion of actual life and feeling and the subordination of the "absolutely musical" to extramusical ideas. In this sense, Richard Wagner (1813-1883), in the footsteps of Monteverdi, Lully, and Gluck, changed his style almost completely. After *Lohengrin* (1847), he abandoned the title opera and adopted the more ambitious word musical drama to cover his *Gesamtkunstwerk*, or work embracing all the arts, which after a gap of seven years emerged with the creation of *Das Rheingold* in 1854. The new music drama was based on the concept of a poetically logical book without arias and other "closed" episodes arresting the breathless flow of action, and, instead, with "unending," almost speechlike melody, supported by an eloquent orchestra to underline the words and to supplement their unspoken thoughts in ever recurring symbols or leitmotifs. Wagner's greatest competitor, Giuseppe Verdi (1813-1901), agreed with him only on dramatic action as the life blood of the musical stage. But as an Italian, Verdi did not sacrifice the sensuous beauty of singing and self-sufficient musical forms, nor could he accept the intellectual approach of the German master. When he was almost 80 years old, however, he converged with Wagner in his last opera *Falstaff* (1893) by abandoning the aria and adopting "endless" melody.

Somewhere between these three poles—grand opera, Wagner, and Verdi—we find a number of French operas that all share the same fate, to be incredibly successful and yet to leave no after effects: Charles Gounod's *Faust* in 1859, the year of *Tristan und Isolde*; Ambroise Thomas' *Mignon* in 1866, the time of Wagner's *Meistersinger von Nürnberg*; George Bizet's *Carmen* in 1875; Camille Saint-Saëns' *Samson et Dalila* in 1877; and Jules Massenet's *Manon* in 1884.

Outside the stage, naturalism faced a stronger opposition. The two main opponents were Franz Liszt (1811-1886) and Johannes Brahms (1833-1897). Around 1850, while Wagner was conceiving his four-night drama, *Der Ring des Nibelungen*, Liszt replaced the stricter symphony by free symphonic poems which, in a single movement, represented some extramusical idea, inspired by poetry or painting. Even his two symphonies, *Faust* and *Dante*, are rather symphonic poems, although in several movements. In a similar vein, his B Minor Sonata for piano is a poem rather than a sonata in the older sense. Brahms, on the contrary, fought for absolute music without extraneous connotations and for the inalienable rights of classical form. Nothing could be more significant (though slightly oversimplified) than Hans von Bülow's enthusiastic welcome to the first of Brahms' four symphonies as the Tenth (after Beethoven's nine); it gave Brahms the status of Beethoven's heir in direct line. Averse to showiness and license, Brahms insisted on classic restraint and strictness in all the fields of orchestral and chamber music as well as in his numerous lieder. No wonder that he never wrote for the stage.

Two men, both organists, stood in age and style somewhere between the Liszt-Wagner group and Brahms: the Belgian, César Franck (1822-1890), and the Austrian, Anton Bruckner

(1824-1896). Bruckner, once more with nine long, majestic symphonies, was nearest to Wagner and farthest from Brahms; Franck, composer of one mystic oratorio (*Les Béatitudes*, 1869-1879), organ pieces, and one symphony (1886-1888), stood much closer to the Brahmsian ideology.

The interest in folk song, with its particular flavor of health and vigor, is absent in most of the men whose names we have quoted. Still, such interest was a strong ingredient in the romantic naturalism of the second half of the century, appeared in the Mighty Five of Russia, who included Modest Musorgski (1839-1881) with his opera *Boris Godunov* and Nikolai Rimski-Korsakov (1844-1908), but excluded Peter Ilich Tchaikovsky (1840-1893) for being too "Western" in his symphonies and operas. It appeared in the Czechs, Bedřich Smetana (1824-1884), creator of the comic opera, *The Bartered Bride*, and the symphonic poems, *My Fatherland*, and Anton Dvořák (1841-1904), whose symphony *From the New World* (1893) has been particularly well known in the United States. A similar urge to write in regional idioms was at the bottom of the Norwegian Edvard Grieg's (1843-1907) piano pieces and songs and, somewhat belatedly, of the works of the American, Edward MacDowell (1861-1908) and the Finlander, Jean Sibelius (1865-1957). With some justification one might add to this list the German Engelbert Humperdinck (1854-1921), with his Wagnerian children's fairy-tale opera *Hänsel und Gretel* (1893).

The Modern Age.—The leaders of the generation active in 1900 fought a bitter battle around romanticism, either to lead it onward beyond its natural end and fulfillment, or else to stop its inevitable decay. There were still a few undiluted romanticists, like Hugo Wolf (1860-1903), the "Wagner of the Lied," Gustav Mahler (1860-1911), the ever-longing master of nine symphonies and many lieder, and Hans Pfitzner (1869-1949), composer of the opera *Palestrina*. And there were also a few undiluted naturalists. Nothing could be more significant than the name of "verists" or truth-followers given to, and accepted by, the Italian opera school from the *Cavalleria Rusticana* (1890) of Pietro Mascagni (1863-1945), to Giacomo Puccini's (1858-1924) *Girl of the Golden West* (1910) and its followers in Germany (Eugene D'Albert, 1864-1932) and France (Gustave Charpentier, 1860-1921).

In a curious last climax, Italians topped naturalism with *futurismo* or, as the French say, *bruitisme*, in an attempt to catch the spirit of the machine age with percussion and other noise makers and more or less without any melody instrument. Its father was Luigi Russolo (1859-1918).

in 1914. Futurism has not died out, although the name has disappeared. Even Edgar Varèse's *Ionisation* of 1931 for 13 players in two groups of percussion has been followed to this day by quite a number of noise pieces, including a broken glass pane to depict an automobile accident.

Against romanticism and naturalism, and against the still dominating influence of Wagner, a new school, termed impressionism, arose in France in the 1890's under the leadership of Claude Debussy (1862-1918). Fascinated by fleeting impressions, by the momentary, transitory images of our senses, by everything passing, vague, and subtle, this school moved away from

MUSIC

musical architecture function, and logic. The laws of melody, harmony, counterpoint, and form, often challenged in the 50 years before Debussy, were dispensed with and replaced by "the iridescent play of dreamy, unrelated chords and of shady, broken colors. If such play was not robust, it was dainty and delicate; if it lacked the backbone of vertebrates, it had at least the fragile beauty of butterflies" (Sachs). Most of Debussy's works were written in the 20 years from 1892 (the symphonic poem *Prélude à l'Après-Midi d'un Faune*) to 1911 (the mystery play, *Le Martyre de Saint-Sébastien*), with a high peak in the middle (his only opera, *Pelléas et Mélisande*, 1902). Thus, his work coincides approximately with the life span of the veristic opera.

Debussy's influence was deep and wide, but hardly any of his followers were quite orthodox. This is particularly true of the greatest of them, Maurice Ravel (1875-1937); his most significant works, however (*Pavane pour une Infante défunte* [1899] for piano; the one-act opera, *L'Heure Espagnole* [1907]; and the symphonic ballet-fragments, *Daphnis et Chloé* [1909-1911]), are contemporary with those of Debussy. The same is true of such non-French impressionists as the Englishman, Frederick Delius (1862-1934), the Italian, Ottorino Respighi (1879-1936), the Spaniard, Manuel de Falla (1876-), the American, Charles Martin Loeffler (1861-1935), and, in a way, the Russian, Alexander N. Scriabin (1872-1915). Most of these masters are indeed the closest contemporaries of Debussy, so that the expression "followers" should be revised: impressionism belonged to one single generation.

The reaction in France came with Erik Satie (1866-1925) and "Les Six" of whom he was the center: cold honesty against romantic false emotions, and cold lucidity against impressionistic haze.

Already Arnold Schönberg (1874-) was beginning to veer from the Wagnerian ideals of his early days (the Tristanic *Der erklarte Nacht* or *Transfigured Night*, 1899, and the gigantic *Gurrelieder*, 1901) to expressionistic coasts where nature, reality, and impression on the outer senses disappear in favor of inner, often subconscious visions and experiences, which so often assume grotesque, distorted forms. Schönberg's expressionism was ready in 1908 with his *Klavierstücke* Opus 11 and had an early peak in his melodramatic cycle *Pierrot Lunaire* Opus 21 in 1912. Of those around the master, Alban Berg (1885-1935) was probably the greatest, and his opera *Wozzeck* (1921), obviously the most representative work.

Richard Strauss (1864-1949) was at that time well past his greatest bloom. He had started out in the footsteps of Mendelssohn and Brahms, had turned to Liszt's and Wagner's ideals, and found his personal language in the ten years in which he wrote his seven self-portraying symphonic poems (from *Don Juan*, 1889, to *A Hero's Life*, 1899) in an orchestral idiom of the last perfection and significance. After having taxed the eloquence of a nontheatrical orchestra to the utmost, he turned to opera and led the musical drama in 14 ever-different works to a similar exhaustion of all post-Wagnerian possibilities, not without having in *Elektra* (1909) moved into the realm of expressionism. In mentioning this fact, one should not leave unsaid that *Eine Alpensinfonie* (1915), Strauss' last symphonic attempt, comes greatly under the spell of impressionism.

What an amazing generation, those born in the

early 1860's! In 1860: Hugo Wolf, the romanticist; Gustave Charpentier, the verist; Gustav Mahler, the arch-romanticist; Isaac Albéniz, the half-impressionist; 1861: the two Americans, Charles Martin Loeffler and Edward MacDowell; 1862: the two impressionists, Claude Debussy and Frederick Delius; 1863: the verist, Pietro Mascagni; 1864: the ubiquitous Richard Strauss; 1866: the anti-romantic and anti-impressionist Eric Satie.

While many a man mentioned in these last paragraphs may be classified under some ism, the masters, styles, and events after World War I cannot yet be properly filed away with suitable labels. Early in this latest period of music history, we face a stormy return to the elements, often cacophonous, often noisy, often primitivistic, and seemingly anarchic. Folk rhythms that enter this picture are no longer sentimental or nationalistic but a shock treatment apt to revive the natural gift and need for rhythmic invention that the Western concentration on harmony and counterpoint had all but strangled. Such a shock was the appearance of American jazz, which reached its climax in the *Rhapsody in Blue* (1924) and the folk opera, *Porgy and Bess* (1935), both by George Gershwin (1898-1937). Another shock came from Béla Bartók's Magyarism (1881-1945), another from Igor Stravinsky's early Russianism (1882-). No other time could have invented the title that Bartók gave one of his youthful piano pieces: *Allegro barbaro* (1910). No other time would have paid so much attention (at the cost of opera) to the ballet, where rhythmical movement reigns supreme and both the classicist and the romantic respect for dramatic action and convincing lifelikeness find themselves pushed back to a role of minor importance. There was an impressive number of unforgotten ballet scores created in the ten years 1910-1920: Stravinsky's *L'Oiseau de Feu* (*Fire Bird*, 1910), *Petrushka* (1911), and *Le Sacre du Printemps* (*The Rite of Spring*, 1912-1913); Richard Strauss' *Josefslegende* (1914); Bartók's *Wooden Prince* (1914-1916); Eric Satie's *Parade* (1916); Darius Milhaud's *Le Boeuf sur le Toit* (*Cow on the Roof*, 1920); and Stravinsky's *Pulcinella* (1920).

Early in the 1920's, music joined the sister arts in a movement which—not without opposition—has been called neoclassicism. It strove for cool impersonality in strictest forms and put, as similar movements have done, an emphasis on solid craftsmanship at the cost of inspiration in a romantic sense. One facet of this turn was a sudden interest in the music of baroque and earlier periods. Such archaism was not entirely new. Mozart and Beethoven had in their last years rediscovered the wonders of Bach's fugues; Haydn had written his two oratorios in admiration of Handel's; Mendelssohn had opposed Bach to contemporary romanticism; Brahms and Gabriel Fauré (1845-1924) had fed on idioms of the past; and Max Reger (1873-1916) had tried to fight his romantic leanings with the inexorable polyphony of the ancestors. Early in the 1920's, the interest in older forms became more general. It affected organ building, the revival of harpsichords, clavichords, and gambas, historical concerts, the study of music history, and, in composition, a predilection for rigid patterns such as the passacaglia, the chaconna, and other so-called *ostinato* forms or ever-recurrent bass motives. The most amazing symbol of these trends is the fact that the greatest composer of Latin-Amer-

ica, Heitor Villa-Lobos (c.1884–), grafted the style of Bach upon his native idiom in the *Bachianas Brasileiras* (1932 ff.).

Diametrically opposite, though in the same direction, stands Arnold Schönberg's contribution to finding a way from chaos to order. Turning his back on atonalism as on something negative, he devised, as a positive solution, a twelve-tone row: the theme is always some typical arrangement of all the twelve notes of the octave, not to be changed during a piece, but susceptible to inversion, to reversion, and to transposition. The earliest document is his Serenade Opus 24 of 1921–1923.

From there on, the historian is in the depressing position of knowing outstanding masters and works, but of seeing them at too close a range to grasp their actual merits, connections, and ultimate roles, which a future generation will easily trace. Except the masters mentioned before there are the patriarchs of those who were living at the time this article was written (1950): the Englishman, Ralph Vaughn Williams (1872–), best known from two works of 1914—the *London Symphony* and the opera, *Hugh the Drover*—both “folksy,” and the latter in the vein of the *Beggar's Opera*; and Ernest Bloch (1880–), with works of Jewish inspiration from the same time—*Trois Poèmes Juifs* for orchestra (1913), and a *Shelomo Rhapsody* for cello and orchestra (1915).

There are the men born in the 1890's: the Russian, Serge Prokofiev (1891–), with a Classical Symphony (1916–1917), and opera, *Love for Three Oranges* (1919), and a lovable fairy-tale for children, *Peter and the Wolf* (1936); the Swiss, Arthur Honegger (1892–), best known from a dramatic psalm, *Le Roi David* (1921), and the railroad apotheosis, *Pacific 231*, a “symphonic movement” (1923); the Frenchman, Darius Milhaud (1892–), composer of the ballets *Le Boeuf sur le Toit* (1919) and *Le Train Bleu* (1924), and of the opera *Christophe Colomb* (1928); the German-born Paul Hindemith (1895–), whose versatility appears in works as opposite in style as the song-cycle *Das Marienleben* (1924), the three operas *Sancta Susanna* (1921), *Cardillac* (1926), and *Mathis der Maler* (1934), and his children's play *Let's Build a Town* (1931); the American, Virgil Thomson (1896–), with the two operas on texts of Gertrude Stein, *Four Saints in Three Acts* (1934) and *The Mother of Us All* (1947).

Among the sons of this century are the American, Aaron Copland (1900–) with *A Dance Symphony* (1925), *El Salón Mexico* for orchestra (1936), and the high school opera, *The Second Hurricane* (1937); the Russian, Dmitri Shostakovich (1906–), who gained world renown with his First Symphony (1919), the operas, *The Nose* (1929) and *Lady Macbeth of the District of Mzensk* (1935), and the Leningrad Symphony (1942); the Frenchman, Olivier Messiaen (1908–), with a symphonic poem, *Les Ombres Oubliées*, and other works in a spirit of Catholic mysticism.

The youngest of the outstanding masters in our time is the Englishman, Benjamin Britten (1913–), creator of the opera *Peter Grimes* (1945). Not only their quality but also their diversity gives a hopeful ending to this brief survey. See also separate articles on OPERA; MUSICAL ELEMENTS AND TERMS; the music of the various countries.

CURT SACHS, New York University Graduate School; President of the American Musicological Society.

MUSIC APPRECIATION. This term has acquired a definite meaning in the United States, and to some extent abroad, particularly in schools and colleges where music is taught. In contrast to the study of musical performance or composition, or even to such subjects as theory, harmony, or musical history, it refers to the enjoyment and possibly the understanding of music by the average listener, who may be completely lacking in technical training or experience.

Music appreciation is, therefore, a subject open to the entire student body of any educational institution, or to the layman in general, adaptable to any curriculum, and within the pedagogic grasp of anyone possessing the necessary enthusiasm and equipment. But the term is still open to a variety of interpretations, and the title is likely to create suspicion in educational circles where the tradition persists that mental discipline of any kind cannot possibly be, and ethically should not be, enjoyable.

Consequently, one hesitates to substitute the word “enjoyment” for “appreciation,” although it expresses far better the object of any such activity in the school or the home. “Understanding” is too ambitious a word, for even a highly educated musical scholar would hesitate to apply it to his own achievements. A vast knowledge of technique and history does not necessarily provide an answer to the eternal question of aesthetics: “What is beauty and how is it attained?” The indefinable quality known as inspiration or genius cannot be caught by a formula or reduced to a mathematical equation.

Music is practically unique in the fact that anyone can enjoy it, without the slightest knowledge or conception of its principles, and that increasing knowledge does not necessarily mean greater enjoyment, although it is fair to assume that it does. Music suffers from the snobbery of the self-sufficient souls to whom it is all an open book, and who resent the suggestion that anyone should be told what to like or why, and from that of the equally self-sufficient ignoramus who boasts that he knows nothing about art but knows what he likes. Strictly speaking, everybody can enjoy music, particularly in its simpler and more obvious forms, without being told how or why. But that instinctive enjoyment which has been called by the writer “the common sense of music” (literally the

sense of music common to all human beings) can be developed into an actual art by the simple process of creative listening, plus perhaps a certain amount of participation where the spirit is willing and the flesh not too weak.

At least it is agreed today that music appreciation in the best sense of the term has little or nothing to do with history, technical details—including a memory for opus numbers and key signatures—or the ability to pronounce foreign words or names correctly. Such information can be found easily in various books of reference, and even the critics and scholars of music (sometimes there is a distinction) would not dream of trying to carry it all in their heads when it is such a simple matter to look it up as needed.

The pursuit or study of music appreciation must be considered in the long run the acquisition of listening habits, just as the practice of athletics generally has as its ultimate object the permanent possession of physical habits. Music teachers may well take a lesson from athletic coaches in this respect, for they are still too often obsessed with the professional tradition, convinced that music is worth pursuing only for the sake of sensational and perhaps lucrative performance. The athletic coach knows perfectly well that only one in thousands of his pupils is likely to become a professional, and his entire effort is based on amateur standards, as that of most music teachers should be.

The errors made by teachers of music appreciation have been owing largely to their inability to put themselves in the place of their pupils. They fail to realize that to the novice all such technical details as notes, bars, staves, and acoustics mean absolutely nothing, and they seem unable either to approach the subject as a whole, from the standpoint of the inexperienced listener, or to cover one point at a time, disregarding the exceptions and explanations which to them are of vital importance but again mean nothing to the layman. Of all subjects, music has been most handicapped by the refusal of its practitioners and teachers to apply the fundamental rule of all pedagogy: work always from the known to the unknown, from the familiar to the unfamiliar.

The tragic joke of this situation, which lies at the bottom of a musical illiteracy that is still appalling, in spite of the best efforts of radio, phonograph, movies, schools, churches, and private teachers to eradicate it, is that music offers more familiar landmarks, more obvious points of departure, than any other art, and perhaps any other subject, in the educational curriculum. Everyone has an instinctive sense of rhythm, keeping time when the band goes by or the orchestra strikes up a good fox trot, regardless of training or past experience. Everyone can recognize a melody after a few hearings, and everyone responds favorably to certain combinations that represent harmony rather than discord and to certain qualities of tone that are universally accepted as pleasing. The only problem of music appreciation, therefore, is to guide these natural instincts in the direction of established standards of beauty, and perhaps to organize them to the extent of permitting an honest appraisal of unfamiliar material, in line with the best judgment of the past, present, and future.

Music may mean anything from the current popular tune to a Brahms symphony, depending

largely on the individual concerned; and while certain matters of taste have been well established and generally accepted, no one living is actually qualified to say didactically «This is good and this is not.» If music lovers and critics are completely honest, they must admit that their enthusiasms, as well as their hostilities, represent primarily a personal preference or prejudice, and that they have no right to impose these on their fellowmen. Time alone can decide what is good music, and it may even be argued that no music can be considered completely bad if it has achieved some degree of permanence. Even though the sensitive pioneers of beauty may arrive intuitively at certain convictions which eventually prove correct, the test of time provides the only real and final answer. Folk music inexorably follows the law of the survival of the fittest; and the much abused word «classic» actually applies to any work of art that is recognized as permanent.

The layman wishing to develop an appreciation of music must, therefore, be content to discover and analyze those qualities and characteristics that appear in compositions of lasting quality, seeking to draw from them conclusions of wide and perhaps universal significance. To this extent it is possible to strengthen and justify an enthusiasm which is fundamentally direct and spontaneous. The unaffected conviction of beauty in any form is something not to be supplied by textbooks or teachers; and no matter how helpful such guidance may prove, those who enjoy or appreciate music must be permitted the feeling of having made this discovery for themselves. So the problem narrows down to the stimulation, encouragement, and analysis of what is actually a normal response to beauty in the universally appealing form of music.

The simplest and most comprehensive definition of music which the writer has been able to formulate constitutes the basis of his textbook, *The Art of Enjoying Music*. This definition, the result of much experience and many experiments with listeners of all sorts, is: «Music is the Organization of Sound toward Beauty.»

There are three important words in this definition. *organization*, *sound*, *beauty*. Sound without organization is mere noise. There is a rule of physics that regular vibration produces musical tone and irregular vibration produces noise. Therefore, the simplest form of organization of sound toward beauty is regular vibration.

But assuming various possible combinations of musical tones in time, there are many ways of organizing these raw materials in the direction of beauty. (It should be noted that the definition says «toward beauty», not necessarily «to beauty.»)

The most primitive organizing factor in music is *rhythm*. This one word covers all the phases of the time element—pulsation, measure, and the organized grouping of accented and unaccented tones. The Italian word *tempo* strictly refers only to the speed at which a composition is played or sung, and this term has become common in English, particularly in relation to the stage and the motion pictures.

Our word *time* has a broader significance. It refers first of all to the fundamental beat of music, which runs always in twos or threes. Roughly speaking, all music can be divided into march time and waltz time (duple and triple). The fundamental twos and threes may be doubled

or even tripled (in various forms of «compound time») but the basic beat remains constant. Even the supposedly irregular 5-4 time is merely the alternation of twos and threes.

Over this fundamental beat of time, represented familiarly by the action of the human heart, the regularity of breathing, the rhythm of sustained walking or running, the tides, the ticking of a clock, and the whole organization of the universe, music presents always a definite pattern of long and short notes, accented or unaccented. This free pattern of time may be called rhythm in the strictest sense of the word. A dancer or an orchestral conductor keeps time to the fundamental beat, in twos or threes, but follows or suggests also the broader rhythmic line, with its accents, its pauses or rests, its retarding or accelerating of tempo.

Rhythm, or time in its broadest sense is the first element in music discovered by mankind, whether it be the savage, the child or the inexperienced, civilized adult. It elicits primarily a physical response, perhaps almost a reflex action. It is no exaggeration to say that most people listen to music with their feet, and many of them never get beyond that stage.

Patterns of rhythm have the unique quality of repeating themselves endlessly, but with endlessly varying effects, depending on how they are filled out with melody and harmony. An amusing game can be played by tapping out the rhythmic pattern of a tune and asking someone to guess the melody. It is surprising how often the guesser will arrive at an entirely different piece of music, but fitting identically the same rhythmic pattern. (The word *pattern* will be found very convenient in its application to all the organizing factors of music.) Compare the rhythmic patterns of such tunes as *Frère Jacques*, *Yankee Doodle*, the old *ABC* (or «1, 2, 3, 4, 5, 6, 7, all good children go to Heaven») and the slow theme of Haydn's *Surprise* symphony. They all share the pattern of one note to a beat.

The rhythmic pattern of a long note followed by two short ones will suggest such different melodies as *Long, Long Ago*, two hymn tunes and Schubert's *Military March*. (See *The Art of Enjoying Music* for all these illustrations.) It is amusing to find that Chopin's *Funeral March* and Wagner's *Wedding March* start with identically the same rhythmic pattern.

Melody (q.v.) is the second and perhaps the most important organizing factor in music. It is the memory element, for people instinctively remember a piece of music by its tune. (Gen. U. S. Grant is quoted as saying that he knew only two tunes. One was *Yankee Doodle* and the other was not.)

Theodore Thomas used to say «Popular music is familiar music,» and he was right. The only problem of making good music popular is that of making it familiar. Therefore, it is fair to state that recognition is the first step toward appreciation. An audience recognizing the first few measures of a familiar encore often breaks into applause. The listeners are not applauding the music or the performer. They are applauding themselves because they recognized it. That is an encouraging sign of human interest in a concert program.

Patterns of melody may consist of only a few notes, and again the possible variations are endless. There are only 12 different notes in

the chromatic scale between one tone and its octave, but mathematicians find nearly 500 million permutations and combinations of these 12 notes. Yet the materials of melody are sufficiently limited to cause the recurrence of recognizable patterns, just as bridge hands will often show a general arrangement of cards that has often appeared before. When a composer is consciously trying to stimulate the memory of his hearers, as is always the case with a popular tune, he almost inevitably falls into reminiscent patterns, and these parallels have often led to accusations of plagiarism and bitter arguments in the courts of law. The answer generally is that the similarities are entirely accidental, and that the supposed thief might as easily have taken his melodic line from a dozen different sources.

The common chord and scale are perhaps the most familiar patterns of melody, and most tunes can be analyzed as based on one or the other, or a combination of the two. (*The Star Spangled Banner* starts with the tones of the perfect major chord, as does the *Blue Danube Waltz*. *Dixie* is a perfect combination of chord and scale patterns. Handel's *Largo* is mostly a series of scale patterns.) But certain combinations are even less elaborate, suggesting such familiar models as the two notes of the cuckoo call (used by Beethoven in his *Turkish March*, with the addition of scale passages), the three notes of the bugle, appearing in *Over There* and many other patriotic tunes, the four notes of the *Westminster Chime*, easily transposed into *How Dry I Am*, *Sweet Adeline*, the *Merry Widow Waltz* and other well known strains, and the five notes of the ancient pentatonic scale, which figures in much of the world's folk music.

Patterns of melody lead logically to patterns of *harmony* (q.v.), and this is the third step in the organization of sound toward beauty. Tones that sound pleasing in a melodic line, representing various levels of pitch, may also be played or sung simultaneously, with even more pleasing effect if they produce what is known as harmony. The traditions of harmony are very strict and limited, while the modern attitude is just as extreme in the other direction. Somewhere between the limits of dissonance and the platitudinous monotony of the commonest chords lies a happy medium that satisfies and stimulates the novice even though it will not necessarily bore the sophisticate.

The subject of harmony has been irreparably buried under a mass of technical detail, most of which has been enthusiastically discarded by contemporary composers. By common consent, the laws of harmony exist only to be broken. Therefore, it is absurd to saddle the layman with a load of outworn rules and formulas which have little or no significance today.

Anyone, however, can learn to recognize such conventional chords as those of the tonic (based on the key-note), dominant (on the fifth interval of the scale) and subdominant (on the fourth). These chords have become most familiar through their use in the various *Amens* at the close of hymn tunes. The average ear can also distinguish between major and minor harmonies, the technical difference of which lies in the mere lowering of the third interval by half a tone. Anyone who has ever sung in a barber shop quartet must have acquired a certain feeling for the fundamentals of harmony, no

matter how crudely expressed, and this unique diversion is actually a phase of American folk music.

Anyone can also discover with little effort the two main types of harmony, which have been burdened with the high-sounding names of «polyphonic» and «homophonic» or «monodic.» The first of these words means «many-voiced» and refers to the early style of harmonizing that reached a climax of popularity in the Elizabethan madrigals and a perfection of detail in the instrumental and vocal fugues of Bach and other masters. In polyphonic music, melodies are made to harmonize with other melodies, and sometimes with themselves. Simple examples are found in the familiar rounds, like *Three Blind Mice*, where a melody is allowed to overlap by starting at different points, thus producing a definite harmony which musical scholars call «strict canon.» The opposite of such polyphony is the common practice of putting chords under the important notes of a melody, enhancing its effect, but with little or no melodic significance within the accompaniment. This is sometimes called «vertical music,» in contrast to the «horizontal» effect produced on the eye by music written as a combination of harmonizing melodies. (Community singers have often enjoyed the simultaneous and fairly harmonious combination of such tunes as *The Long, Long Trail* with *Keep the Home Fires Burning*, *The Spanish Cavalier* with *Solomon Levi*.)

After the discovery of rhythm, melody, and harmony, the human ear becomes aware of *tone color*, or quality (known also by the French word *timbre*). This is an important factor in music, particularly of the modern type, where instrumental and vocal coloring have often been made to atone for a lack of melodic originality or inspiration. Every musical instrument, including the human voice, has an individual color or quality which can be recognized by any listener. A violin is as different from a cello as a soprano is from a baritone. There is no mistaking the difference between a flute tone and that of a trumpet or trombone, and this variety of color can eventually be detected even in closely related instruments like the oboe and English horn, or the clarinet and the saxophone.

When instruments or voices are heard in combination, the resulting tone color is all the more interesting and sometimes quite complicated. Those who enjoy music can find endless fascination in analyzing the compound tonal coloring of a symphony orchestra, a string quartet, a mixed chorus, or even a jazz band, whose muted brass and elaborate percussion have added much to the timbres of modern music.

The final organizing factor is *form*, and this is largely an intellectual process, but based also upon human instinct and universal laws. The organizing factors of rhythm, melody, harmony, and tone color must all be brought together under the general head of form, to create a complete composition. The basic pattern of form may be summed up as *statement, contrast, reminder*, often expressed by the letters ABA. A composer states his theme, which may be called his chief melodic idea. He then introduces something to provide contrast, suspense, even conflict, as is customary in all art, finally reminding the hearer of the material which had been presented at the outset.

This simple pattern of form applies to all music, from a primitive folk tune to an elaborate symphonic movement. It is the principle followed by a novelist or playwright, who similarly introduces his characters at the start, then creates the conflict and suspense of a good plot, and finally arrives at a happy or at least a logical ending.

In music the themes or tunes are the characters, and such words as *exposition*, *development* and *recapitulation* are used, very much as on the stage. In fact, these same words are applied to sonata form, perhaps the most elaborate in all music, appearing regularly in the first movement of a sonata, a symphony, a concerto or a string quartet. It is actually a development of the simple ABA formula which can be found in the chorus of any popular tune. The first section (A) is generally repeated for emphasis, with B serving as contrast and A finally returning as a reminder. (This basic form is found in such an excellent song as Jerome Kern's *Smoke Gets in Your Eyes*, as well as in a folk tune like the French *Au Clair de la Lune* and thousands of other famous pieces of music.)

In sonata form, the contrast is provided by a development of the melodic material, appearing in at least two themes or subjects, corresponding to the hero and the heroine of the play or novel. This development, sometimes known as a «free fantasia,» carries the tunes into various keys, breaks them up or turns them upside down, hands them over to various instrumental combinations, changes the harmony and perhaps the rhythm, and even plays them against each other in the polyphonic style called «counterpoint» (meaning «point against point» or «note against note»). This is the most difficult part of a symphony for the inexperienced listener, but if he is familiar with the tunes, it becomes increasingly interesting, just as the details of architecture grow upon the beholder after the fundamental outlines have been grasped.

Musical contrast may also be provided by «variations,» which are literally decorations or embellishments of a theme. (The form has become very popular in the improvisations of swing and «hot» jazz, whose devotees are generally unaware that their enthusiasm is responding to the lighter version of an established classical convention.) A theme with variations may provide the slow movement of a symphony or sonata. See also CONCERTO; SONATA AND SONATA FORM; SYMPHONY.

Beyond these elaborations of the song principle, most instrumental music is based on dance forms, such as the rondo, the minuet, the gavotte. The rondo is literally a round dance, with one tune returning again and again, in contrast with other interpolated themes. The minuet is the classic dance in triple time (slower than the waltz) and appears often as a symphonic movement, with the scherzo eventually taking its place. The classic suite, forerunner of the symphony, was actually a set of dances strung together without any necessary relationship.

The listener who acquires the habit of approaching music through its organizing factors of rhythm, melody, harmony, tone color, and form will find no difficulty in enjoying and perhaps appreciating almost any composition whose greatness is established by the test of

time. He can remain open-minded as to modernism and jazz (both of which represent the distortion of the conventions of music), and if they honestly appeal to him, he has no need to feel ashamed. It is well, however, to build up a fairly solid background of the recognized classics before venturing upon too many experiments.

The music that one is likely to hear nowadays, through radio, records, and actual performance on the concert or operatic stage, can be classified in a number of ways. The broadest division perhaps is that between *vocal* and *instrumental* music, and of the two the former is definitely the more popular, if only because the addition of words makes immediate understanding far easier. Grand opera (q.v.) has the further advantage of action, costumes, and scenery, and may therefore be considered the most obvious and at the same time the most elaborate of all types of music. Ballet achieves a similar effect through pantomime, and this also appeals automatically to a large public.

Another common distinction is that between *program* and *absolute* music. The first term applies to compositions that tell a story or paint a picture, perhaps indicated only by a descriptive title, like Liszt's *Dream of Love*. Technically the term «program music» is applied only to instrumental pieces, although in its broadest sense it necessarily covers all vocal music, whose program is made quite clear by the words. Absolute or «pure music» depends entirely upon mere tonal patterns for its effect, getting no help of any kind even from a title or a program note. It is fair to say that if a piece of absolute music inevitably produces a certain mood or emotion it must be conceded the highest possible merit. On the other hand, a piece of program music may well have an absolute value, worth hearing for itself alone, regardless of pictorial or narrative significance.

For the untutored explorer in the endless field of music the best and most satisfying start can be made in the direction of vocal music, and this has been clearly proved with children as well as adults. Simple songs appeal to everyone and require no elaborate machinery of appreciation for their enjoyment.

The quickest response to both vocal and instrumental music may be created by strong and obvious effects of rhythm, and this also appeals to young and old alike. Dance tunes of all kinds have no difficulty in winning a direct and favorable reaction, without requiring any study or analysis. After such simple discoveries, the development of music appreciation may go as far as the individual desires.

Program music will generally be found easier to grasp than absolute music, and this is again a natural process of selection. Eventually adventures in tonal design will be found just as fascinating as the interpretation of a definite meaning or the awareness of an abstract emotion. The enjoyment of music rests ultimately with the individual, and if this response is not sincere and spontaneous, no amount of study will make it so.

If music is «the organization of sound toward beauty», the chief emphasis must be on the final word, and beauty has not yet been satisfactorily defined. To say that it is the same as truth is an evasion, for truth itself has remained indefinable. But the discovery of permanent beauty

in any form, and particularly in the universal language of music, is an experience that anyone may enjoy, entirely personal, and contributing enormously to the enduring satisfactions of life. See also MUSIC.

SIGMUND SPAETH,

Musician, Lecturer and Writer.

Bibliography.—Books: Spaeth, Sigmund, *The Common Sense of Music* (New York 1924); idem., *The Art of Enjoying Music* (New York 1933); Stokowski, Olga Samaroff, *Layman's Music Book* (New York 1935); Scholes, Percy, *Music Appreciation* (New York 1935); Moore, Douglas, *Listening to Music* (New York 1937); Copland, Aaron, *What to Listen for in Music* (New York 1939); Abbott, Lawrence, *Approach to Music* (New York 1940); Barton, Fred B., *Music as a Hobby* (New York 1941); McKinney, Howard D., and Anderson, W. R., *Challenge of Listening* (New York 1943); Frskine, John, *What Is Music?* (New York 1944); Ewen, David, *Music for the Millions* (New York 1944); Spaeth, Sigmund, *A Musical Digest* (New York 1945); idem., *Music for Everybody* (New York 1945); idem., *Fun with Music* (New York 1945).

RECORDINGS: Bach, J. S., the *Inventions*, *Well-tempered Clavichord*; suites. Beethoven, L. van, the nine symphonies; *Egmont*; *Leonore* Overture No. 3; *Coriolanus* overture; *Ruins of Athens*; Violin Concerto; Piano Concerto No. 4 in G; Piano Concerto No. 5 in E Flat (*Emperor*); String Quartet, Op. 18, No. 1; the *Appassionata*, the "Moonlight," the *Pathétique*, and the "Waldstein" piano sonatas; First in D Major, and *Kreutzer* piano and violin sonatas. Berlioz, H., *The Damnation of Faust* (dances); *Rakoczy* March; *Roman Carnival Overture*. Bizet, G., *Carmen*; *L'Arlesienne* suites. Brahms, J., the four symphonies; Violin Concerto in D; piano concertos in D Minor and B Flat; songs; violin sonatas in G, A Flat, and D Minor; piano pieces; *Academic Festival Overture*; *Variations on a Theme by Haydn*; *Hungarian* dances; waltzes; string quartets; trios; and quintets. Chopin, F., piano concertos in E Minor and F Minor; Piano Sonata No. 2 in B Minor; etudes; preludes; mazurkas; waltzes; nocturnes; polonaises; scherzos; ballades; *Fantasia* in F Minor; *Fantasia Impromptu*. Debussy, C., *Prelude to the Afternoon of a Faun*; nocturnes; *La Mer*; String Quartet in G Minor; piano pieces; songs; *Pelléas and Mélisande*; *Images*. Dvorak, A., Symphony in E Minor (*From the New World*); *Carnaval* overture; songs; String Quartet No. 6 in F («American»); *Slavonic* dances; String Quintet, Op. 97; humoresques; Cello Concerto in B Minor. Franck, C., Symphony in D Minor; Piano Quintet in F Minor; String Quartet in D; Violin Sonata in A; piano and organ music; songs; *Symphonic Variations* for piano and orchestra. Gershwin, G., *Rhapsody in Blue*; *An American in Paris*; Piano Concerto in F; *Porgy and Bess*. Gluck, C. W., *Alceste* overture; ballet music from *Orpheus and Eurydice*. Grieg, E., *Peer Gynt* suites, Nos. 1 and 2; Piano Concerto in A Minor; songs; piano pieces. Handel, G. F., *The Messiah*; concertos; *Largo*; *Harmonious Blacksmith*. Haydn, F. J., *Surprise*, *Clock*, *Military*, and *London* symphonies. Liszt, F. von, *Les Preludes*; piano concertos in E Flat and A Flat; *Hungarian* rhapsodies; *Hungarian Fantasy*; piano solos and transcriptions; songs. MacDowell, E., Second (*Indian*) Suite; Piano Concerto No. 2 in D Minor; songs; piano pieces. Mendelssohn, F.,

Italian and Scotch symphonies; the oratorio Elijah; Violin Concerto in E Minor; Songs Without Words; Ruy Blas, Fingal's Cave, and Midsummer Night's Dream (nocturne, scherzo, and Wedding March) overtures; songs; piano pieces. Mozart, W. A., *Jupiter*, G Minor, and *E Flat symphonies; Don Giovanni, The Marriage of Figaro; The Magic Flute*; chamber music. Prokofiev, S., *Classical symphony; Peter and the Wolf*, Marches for Military Orchestra. Puccini, G., selections from *La Bohème; La Tosca; Madame Butterfly*. Rachmaninoff, S., *Symphony No. 2 in E Minor; Piano Concerto No. 2 in C Minor; The Isle of the Dead*; songs; piano pieces. Ravel, M., *Mother Goose suite; Bolero; La Valse; String Quartet in F; Piano Trio in A Minor*; the ballet *Daphnis and Chloe*; piano pieces. Rossini, G. A., *The Barber of Seville; William Tell* overture. Sibelius J., symphonies, No. 2 in D, and No. 5 in E Flat; *Finlandia; Valse Triste; The Swan of Tuonela*; Violin Concerto in D Minor. Shostakovich, D., *First, Fifth, and Seventh symphonies; polka from The Golden Age*. Strauss, R., *Till Eulenspiegel's Merry Pranks; A Hero's Life; Death and Transfiguration; Don Juan; Don Quixote*; waltzes from *Der Rosenkavalier*, songs. Stravinsky, I., *Petroushka; L'Oiseau de Feu (The Fire Bird); Le Sacre du Printemps (The Rite of Spring)*. Tchaikovsky, P. I., symphonies No. 4 in F Minor, No. 5 in E Minor, and No. 6 in B Minor (*Pathétique*); Violin Concerto in D Major; Piano Concerto No. 1 in B Flat Minor; *Romeo and Juliet*, fantasy overture; *Francesca da Rimini*, symphonic fantasy; *Festival Overture, 1812, Marche Slave*, suite from the *Nutcracker* ballet; *The Swan Lake* and *The Sleeping Beauty* ballets; *Capriccio Italien*; String Quartet in F. Verdi, G., selections from the operas; *A Requiem Mass*. Wagner, R., selections from the operas; overtures; songs. Weber, K. M. von, *Invitation to the Dance; Oberon, Der Freischütz, and Kuryanthe* overtures.

MUSIC DRAMA. See DRAMA; MUSIC; OPERA.

MUSIC FESTIVALS. Music festivals may be traced as far back as the 11th century, when the French troubadours took part in the *puy*s, or festivals of the literary and musical guilds. Competitions and prizes were part of the festivities, and the Puy d'Euvreux was held annually from 1570 to 1614. These festivals became models for the Sängerkriege of the German Minnesinger, and the Eisteddfod of the Welsh bards. In England the Festival of the Sons of the Clergy was founded in 1655, and in 1724 the Three Choirs Festival was started in England, combining the choral societies of Gloucester, Worcester, and Hereford. Both of the latter festivals have survived to modern times. There are also in England the Norwich Festival (1770) (now held triennially), the Leeds Festival (1858), and the Handel Festivals in London's Crystal Palace (1857). On the European Continent the Neiderheinische Musikfeste was established in 1817, and has been held alternately in Cologne, Düsseldorf, and Aachen. The Tonkünstlerfeste of the Allgemeiner deutscher Musikverein were started by Liszt in 1861 and continued until 1932, annually in different German cities. Most important have been the periodic festivals honoring the great composers, generally held at their birth-

places: the Beethovenfeste at Bonn, the Bachfeste at Eisenach, and the Mozartfeste at Salzburg. Wagner himself started the Bayreuther Festspiele held annually long after his death.

In America, festivals on a large scale started in Boston with a festival of the Handel and Haydn Society of that city in 1857, and in Worcester the following year. These, however, were special, not annual affairs. Likewise the two festivals organized by Patrick Sarsfield Gilmore in Boston, historically important because of their mammoth proportions, were single occasions of five days' concerts each. The first, held in 1869, commemorated the end of the Civil War, and the second (1872), the close of the Franco-Prussian War. The oldest of the present day festivals are those held annually in October at Worcester, Mass. (founded in 1871), and the Cincinnati May Festivals (1873). The Ann Arbor (Mich.) May Festival dates from 1893. In 1900 the annual two-day Bach Festival was started at Bethlehem, Pa., and has continued.

In more modern years a number of festivals have come into being, some with special objectives. At the Eastman School of Music at Rochester, N. Y., the Eastman Festival of American Music has annually presented a week's programs of American music since 1931. The Berkshire Festivals at the Library of Congress in Washington, D.C. (1925), have presented annual series of chamber music concerts. The International Society for Contemporary Music has concerned itself with festivals of music by modern composers since 1923. These were first held in foreign cities, but since 1941 they have been given in the United States.

In 1936 Serge Koussevitzky established a summer festival of concerts by the Boston Symphony Orchestra which have continued annually at the Berkshire Music Centre in Tanglewood, Mass. In addition to a month of concerts by the orchestra and by chamber music groups, opera is presented, and a music school offers instruction in various subjects. For a number of years the Central City Play Festival in Colorado has offered operas and concerts as well as plays in its three-week July season.

MUSICAL ELEMENTS AND TERMS.

Music is the meaningful connection of sounds. Any sound is produced by the vibration of air or of a solid body. When such vibrations are irregular, the sound is a *noise*; when they are regular, the sound is a musical *tone*. Music depends in the main on tones, but does not exclude noise (as in drums, cymbals, or clappers). Slow vibrations produce the tones and noises which we call low; fast vibrations produce the higher sounds. The practical range of music extends from about 40 to about 4,000 vibrations per second, but goes beyond these limits in accessory tones, such as partials and combination tones (see ACOUSTICS).

The exact number (frequency) of vibrations or cycles gives a tone its height or *pitch*. In a narrower sense, we call pitch the standard height of the tone *a'* (near the middle of the piano) from which all musical tones derive their pitches. It is given to all tuning forks and is played by an oboist when the orchestra tunes up before the beginning of a piece. The American standard *a'* is today 440 vibrations.

The reader who wishes to make himself familiar with the elements and basic terms of

music may look at a piano. On its keyboard he finds all the tones in a continuous sequence from the lowest (left side) to the highest (right side). The keys, white and black, alternate in a characteristic pattern seven times repeated. It consists of two easily visible groups of black keys—one of two, one of three—and of the neighboring white keys, seven in number. The white keys, in ascending order, are called by the letters C D E F G A B.

Looking at these white keys, we are under the impression that each two of them are musically equidistant. But the neat arrangement deceives: While the size of a normal step, like C-D and D-E is that of a whole tone or tone, E-F and B-C form only semitones half as wide as the whole tone. The reader is here, not for the last time, confronted with an ambiguous name: tone has the two distinct meanings of an individual sound and of a normal step between two of such tones. This ambiguity is probably the reason why the word *note*, originally confined to the visual symbol of an individual tone when written or printed, is often used for the tone itself.

Looking again at the keyboard, one realizes that there is no black key between those white keys which form only semitones; the black keys serve to split the whole tones into semitones. Owing to their intermediate position, they alter and replace both their upper and their lower white neighbor; a black between C and D sharps the lower neighbor by a semitone and also flats the upper neighbor by a semitone. Hence the black keys have two names each, according to their position and function within a piece: (1) C sharp or D flat; (2) D sharp or E flat; (3) F sharp or G flat; (4) G sharp or A flat; (5) A sharp or B flat. Abbreviating symbols are # for the sharp and b for the flat. Any sharp or flat is, when necessary, revoked by a natural, or ♮, which re-establishes the white key.

Any semitone, such as E-F, is also called a minor second, and any tone, such as C-D, a major second. The step one semitone wider, such as C-E^b or as D-F, is a minor third; four semitones, like D-E, form a major third. There is a perfect fourth from C to F; an augmented fourth, from C to F sharp or from F to B; a perfect fifth, from C to G; a minor sixth, from E to C; a major sixth, from D to B; a minor seventh, from C to B flat; a major seventh, from C to B; an octave, from C to C.

The word *octave* is one more ambiguous term. It indicates (1) the distance of 12 semitones, which is characterized by a difference in altitude, one note being lower and one higher, but at the same time by a similarity of their essential quality, both of them being C's or D's or E's, which accounts for a repetition of the musical letter-names above and below the normal pattern indicated before. The word indicates also (2) the

simultaneous occurrence of two such tones (as when a woman and a man sing the same melody); (3) the sequence of tones between any tone and its octave; and (4) the same sequence without the eighth tone. It is in accordance with meaning (4) that musicians speak of *contra*-, *great*-, *small*-, *one*-, *two*-, *three*-, *four*-, *five*-lined octaves, the names being extended to all individual tones between C and B:

contra octave: C₁D₁E₁F₁G₁A₁B₁

great octave: C D E F G A B

small octave: c d e f g a b

one-lined ('middle') octave: c'd'e'f'g'a'b'

two-lined octave: c''d''e''f''g''a''b''

three-lined: c'''d'''e'''f'''g'''a'''b'''

four-lined: c''''d''''e''''f''''g''''a''''b''''

Between any C and its octave, the white keys form semitones as the third and seventh steps. But this arrangement is by far not the only one that music uses. Under the somewhat bewildering name of a *major* scale (because it has a major third), it is opposed to the *minor* scale from A to A, in which a semitone, B-C, forms the second step and provides the interval of a minor third (A-C) where there had been a major third in major.

The other possible octave sections of the white-key row are obsolete, but survive in the ecclesiastical modes: D-D is the so-called first or Dorian mode; E-E, the third or Phrygian mode; F-F, the fifth or Lydian mode; G-G, the seventh or Mixolydian mode; A-A, the second or Hypodorian mode; B-B, the fourth or Hypophrygian mode; C-C, the sixth or Hypolydian mode; D-D, the eighth or Hypomixolydian mode (which differs from the first mode in its inner structure). In all these octaves, the relative position of the semitones is the distinguishing feature.

However, these octaves are by no means confined to the white keys. With the aid of black keys, the major or the minor or the Dorian scale can start on each of the 12 keys between C and B and yet preserve the characteristic position of its semitones. This is expressed by the well-known addition of tone-letters: if Beethoven's First Symphony is in C major, its basic scale is built on C, while the master's Second Symphony in D major has the same position of the semitones, but is transposed up by a whole tone. In this case the major character can only be achieved by introducing two black keys, F sharp and C sharp, lest it would be that of Dorian instead of major. In a similar way, Beethoven's Fifth Symphony in C minor needs the flattening of E, A, and B to make the C scale minor.

In order to simplify notation, the composer does not sharp or flat the notes in question wherever they occur, but marks them at the beginning of each staff as the so-called key signature: one sharp for F denotes both G major and E minor; 2 sharps for F and C denote D major and B minor; 3 sharps for F, C, and G denote A major and F sharp minor; 4 sharps for F, C, G, and D denote E major and C sharp minor; 5 sharps for F, C, G, D, and A denote B major and G sharp minor; 6 sharps for F, C, G, D, A, and E denote F sharp major and D sharp minor; 7 sharps for F, C, G, D, A, E, and B denote C sharp major and A sharp minor. One flat for B, on the other hand, denotes F major and D minor; 2 flats for B and E denote B flat major and G minor; 3 flats for B, E, and A denote E flat major and C minor; 4 flats for B, E, A, and

D denote A flat and F minor; 5 flats for B, E, A, D, and G denote D flat major and B flat minor; 6 flats for B, E, A, D, G, and C denote G flat major and E flat minor; 7 flats for B, E, A, D, G, C, F denote C flat major and A flat minor.

With key signatures, the reader has entered the maze of notation. The individual notes are expressed by oval *heads* placed higher up or lower down according to their position in musical space and on the keyboard. In order to make this position clear beyond doubt, the note heads are written on a *staff* (plural, *staves*) of five horizontal lines, each line and each space between lines determining a definite note or tone of the scale: from below, the five lines stand for e g b d f, the four spaces for f a c e, and the two places directly below the lowest and above the highest line, for d and g. You can go beyond this narrow compass by placing additional notes, above or below the staff, on *ledger lines*, which are abbreviations of the regular lines not much wider than the note itself. But even with ledger lines (which are confusing when they exceed the number of three above each other), the one staff is not sufficient to cover the whole range of seven octaves that our music uses. Hence the lower instruments, such as bassoons and double basses, and also the left hand of the pianist, avail themselves of a second staff, whose lines and spaces have a different meaning: the lines denote G B d f a, and the spaces (F) A c e g (B), with corresponding ledger lines. Where too many ledger lines imperil easy reading, a dotted line, preceded by a figure 8 or 8va (*ottava*) indicates a transposition by an octave—upwards if the line is drawn above the staff, and downwards, if it is drawn below. To show the reader which of the two meanings a staff conveys, it carries one of two *clefs* right at the beginning—even before the key signature. That of the higher staff is a G, or violin clef, , located on the second line from below and making it g'. That of the lower staff is an F, or bass clef, , located on the fourth line from below and making it (small) f. Besides these current two clefs, the viola has still preserved one of the otherwise extinct clefs of older times: the alto clef, , which makes the middle line a c'; and the violincello as well as the tenor trombone still cling to the obsolete tenor clef, which makes the fourth line from below a c'.

Speaking of high and low, of alto and tenor, it will be advisable to mention the principal types of musical altitude. Their terminology derives from the four or six registers of the human voice. Soprano or treble and alto belong to women and boys (although in earlier times the alto used to be a man's voice). The mezzo-soprano stands in between. Tenor and bass or basso belong to men, with the baritone in between. The instruments have taken over the vocal names: we speak of soprano cornets, alto clarinets, tenor trombones, and bass tubas.

While the staff of five lines and its clef take care of the pitches—whether a note is to be great C, small d, or anything else—the various shapes given to the notes themselves are symbols of their duration; the notes themselves show how long they shall be heard. The *head* of the note, to be sure, is always oval; and yet there are decisive differences. A plain white oval without any addition is the longest note in use, extending over four time units, or *beats*. The half note, extending over two beats, is a white oval with a

vertical *stem*; the quarter note, representing one beat, is a black oval with a stem. Beyond the quarter note, always dividing by two, we use a black oval with a stem and a *flag* at its end as the eighth note; with two flags, as the sixteenth; with three flags, as the thirty-second; with four flags, as the sixty-fourth; with five flags, as the one hundred and twenty-eighth. The stems, with

WHOLE-NOTE HALF-NOTE QUARTER EIGHTH SIXTEENTH THIRTY-SECOND

or without flags, grow upward from the right end of the head when the notes are located below the middle line of the staff. Upwards from this line, the stem grows downwards from the left end of the oval. In instrumental music, when two or more consecutive notes are flagged, the individual

flags are replaced by as many connecting *beams* to join them in a group; but such joining rarely exceeds the value of a quarter note; that is, it connects no more than two eighths, or four sixteenths, or eight thirty-seconds.

A dot to the right of a note adds 50 per cent to its time value: a dotted whole note measures three halves instead of two, a dotted half note, three quarters, and a dotted quarter, three eighths. Two dots behind a note add 50 plus 25 per cent: a double-dotted whole note measures $2 + 1 + \frac{1}{2}$ half notes or 7 quarters, and a double-dotted half note, $3\frac{1}{2}$ quarters or 7 eighths. A figure 3 above a group of three units indicates a triplet, which takes only the time of two such units. In a similar way, but by exception only, music uses duplets (to fill the time of three units), quadruplets (instead of three), and quintuplets (instead of four).

Often, a voice or an instrument stops for a little while in the progress of a piece. In such a case, the composer marks their silence by *rests* of

WHOLE-REST HALF-REST QUARTER EIGHTH SIXTEENTH THIRTY-SECOND

adequate length: Rests, too, may be dotted or even double-dotted.

A dotted half circle , called *pause* or *fermata* (that is, stop), above an individual note lengthens it irrationally at the performer's discretion.

Music depends not only on the pitches and

lengths of tones, but also on their organization in rhythmic patterns. Such organization, made visible in the well-ordered movements of the conductor, consists in the regular alternation of stressed and unstressed or lesser stressed time units or beats. Its symbol, the *time signature*, is usually a fraction of two figures, marked on the staff right behind the key signature and not repeated on the following staves. When the alternation of stresses is quite strict and simple—one beat stressed, one unstressed—we speak of two-four or $2/4$ time, thus indicating that the pattern consists of two quarter notes. When, however, every stressed beat is followed by two unstressed beats, we speak of three-four or $3/4$ time, thus indicating that the pattern requires the time of three quarter notes (as in the *Star-Spangled Banner* and *America*, as well as in all waltzes). When the stressed beat is followed by three unstressed beats, we speak of four-four time (as in *America the Beautiful*), with the signature $4/4$ or \square . When the time signature has 8 instead of 4 as the denominator, such as in $4/8$, $5/8$, $6/8$, the unit of time is an eighth note. Inversely, the denominator 2, as in $3/2$, indicates that the pattern comprises three half notes. A special case, remainder of an old, forgotten practice, is marked by ♩ : it is called by the archaic name *alla breve* and makes a four-four time twice as fast as it would normally be. The conductor marks only two beats within the pattern, which, though written as halves, mean actually quarters.

To facilitate playing and singing, the pattern is set between vertical bar-lines running all the height of the staff. They always stand directly before a stressed note. The group inside the lines is called a *bar* or a *measurc*. However, such a bar coincides with the rhythmical pattern only when the latter starts on the accented beat or *downbeat* (as we call it from the stressing gesture of the conductor). *God Bless America* and *My Country 'Tis of Thee* are examples. When, on the contrary, the pattern begins on the unaccented time or *upbeat* (as for example in the *Star-Spangled Banner* and *America the Beautiful*) it does not coincide with the measure.

Any deviation from the regular alternation of stressed and unstressed beats by introducing accents where normally there would be an unaccented beat—a well-known device in all forms of jazz and swing—is called *syncopation*.

Tempo.—Although the denominator of the time signature implies very roughly a difference in speed or tempo—since a three-eight is necessarily faster than a three-four, and a three-four faster than a three-two—musical practice has better means to indicate different tempos (or, more correctly, *tempi*). In the first place, all languages use a moderate stock of terms denoting tempo and general mood. But more frequent in scores of any nationality are the internationally recognized Italian words *molto adagio*, very slow; *adagio*, slow; *largo*, broad; *larghetto*, rather broad; *andante*, not too slow; *andantino*, still less so; *moderato*, moderate; *allegro*, brisk; *allegretto*, less so; *presto*, fast; *prestissimo*, as fast as possible. But these and other similar indications at the head of a piece are more or less vague, and their appropriate interpretation has often been open to discussion. A more precise direction, generally together with one of the Italian terms, is found in a short equation above the signature of the first staff of a piece and

might read as, say, $\text{♩} = \text{MM } 80$. The double letter MM refers to the metronome that the mechanic Johann Nepomuk Maelzel (Mälzel) invented in 1816. It is a pyramidal box with a ticking pendulum whose speed can be regulated by shifting a little weight in front of a calibrated plate: 80 means that by shifting the weight, the pendulum should be made to tick 80 times per minute and that every tick should mark a quarter note. Changes within a piece are prescribed as *accelerando*, growing faster, and *ralentando*, growing slower. *A tempo* restores the original tempo.

Intensity.—The intensity, or volume of sound, of an individual tone or a whole section is marked by the abbreviations pp for *pianissimo*, very soft; p for *piano*, soft; mp for *mezzopiano*, half-soft; mf for *mezzoforte*, half-loud; f for *forte*, loud; ff for *fortissimo*, very loud. Exceptionally, the extreme intensities have been exaggerated up to ppppp and fffff. Increasing intensity is called *crescendo* (growing, abbreviated *cresc.*); decreasing intensity, *decrescendo* or *diminuendo* (*decr.*, *dim.*). Oftener, these words are replaced by graphic symbols which allow marking exactly the extent of the increase or decrease: the former one by a prone, acute angle open to the right; the latter one by a similar angle open to the left. An extraordinary accent on an individual note appears in notation as sf, for *sforzando* (strengthening), or as a short, acute angle, either prone or pointing downward.

There are finally a few signs for the correct execution of individual notes and whole groups of notes. A dot or accent above a note means *staccato* (detached), and requires a light touch and prompt release of the note, irrespective of its original time value. The opposite of staccato is *legato* (joined), which appears in notation as a shallow arc reaching from the first to the last note of the joined group. While this kind of arc is called a *slur*, the name *tie* is reserved for a similar arc that connects two notes of the same pitch whenever it is not possible or wise to write them as a whole (for instance, when a note reaches beyond a bar-line, or when there is no proper symbol for the time value of a note, as, let us say, for a half note plus an eighth).

Musical Forms.—The concept *form* reaches from the smallest to the largest structural units. The smallest unit is a *phrase* of generally two or four or even eight measures which ends in an *open cadence*, that is, a formula that leaves the listener in suspense. Only a second phrase, similar in some respect, ends in a *closed cadence* that gives a satisfactory conclusion. The two phrases, called also *antecedent* and *consequent*, form together a *period*. Periods can be multiplied and grouped in quite a number of ways; indeed, they can be repeated without any change. When such is the case, the composer marks the repetition by a *repeat* sign: a double bar-line with, towards the section to be repeated, two dots above and below the middle line of the staff. This seriation of even periods is characteristic of simple songs and of dances. In certain dances, such as the minuet which has survived in our symphonies (either in its original form or, since Beethoven, as the scherzo), the structure is threefold, ternary, or *da capo*, the first part being repeated after the second part. The composer marks this repetition either by reprinting the first part in full or else by adding, after the second part, the cue *da capo* (from the beginning), to which might be added

dal fine (to the end). But if he does so, he must print the word *fine* at the end of the first part. The second, middle section of a minuet is called *trio*, because the masters of the 17th century gave it to three solo instruments, while the outer sections were left to the full orchestra.

In the *rondo*, which has often been used to conclude sonatas and symphonies, the periods are arranged in a peculiar way: the sections 1,3,5,7, and so on are similar or identical, while the sections 2,4,6,8, and so on differ, both from the first one and from each other.

The slow movement of a symphony or sonata often consists in a set of *variations*. In its basic form, such a set requires a *theme*, usually in the shape of one or several periods, and a number of individual variations which disguise the theme enough to give it in all their melodic and harmonic transformations an ever new interest without effacing its general outline and character.

Preceding these typical movements of the classical symphony and sonata—the slow variations, the minuet or scherzo with its minuet, and the rondo—we find a first and principal movement in *sonata form*. Before describing it, two bewildering points must be clarified. In the first place: the so-called sonata form belongs not only to sonatas for piano alone or for piano and some other instrument, but also to all typical chamber music, such as trios, quartets, and quintets for three, four, five instruments, to symphonies for full orchestra, and to concertos for some solo instrument with the accompaniment of the orchestra. In the second place: although these types of compositions have as a rule four movements (concertos have but three), only the first movement, and sometimes the last too, has the sonata form proper. It begins with the energetic first theme in the *tonic*, that is, the principal key of the movement, and contrasts it with a more lyrical second theme in some related key. This duplex *exposition* is repeated. Then comes the *development*, where characteristic fragments of the principal theme or of both themes are used “to fight it out,” until the potentialities of the thematic material are exhausted. At this point, the exposition reappears victoriously as the *recapitulation* and ends in a decisive *coda*, or conclusion. In concertos, the *coda* is delayed by a *cadenza*, in which the soloist, without the orchestra, is allowed to show his bravura technique in another neck-breaking development. This section is a strange leftover from the virtuoso times of the 18th century and should as such be improvised. However, the *cadenzas* that we hear today are ready-made and carefully studied.

There is, beside the sonata proper, a *sonatina* in smaller proportions, both as to size and to weight.

The special form of the *fugue*, which can be independent or else serve as the climax of a last sonata movement, is explained in a separate article.

While all these forms are more or less strict (though all of them leave a good deal of freedom to the composer), other forms are free by definition: the *toccata* (play piece) in which chordal episodes alternate with rapid passages, the loosely written *rhapsody*, and the quite informal *fantasia*. See also separate articles on musical forms.

MUSICAL TERMS

The following glossary includes the most commonly used terms and phrases of the vocabulary of music. Important terms treated separately in this Encyclopedia are designated by the reference: *See separate article*. English or Anglicized terms which are self-explanatory are generally omitted since they need no definition.

A Battuta (It.).—Indicating a return to strict time after deviations.

A Cappella (It.).—Unaccompanied choral music.

A Capriccio (It.).—At will, agreeable to fancy.

Accelerando (It.).—With gradually increasing velocity of movement.

Accent.—See separate article.

Acciaccatura (It.).—An ornament in harpsichord music, giving to chords the effect of an arpeggio.

Accidentals.—Occasional sharps, flats, and naturals placed before notes.

Accompaniment.—See separate article.

Acoustics.—See separate article.

Adagio (It.).—Slowly: slower than *andante* and faster than *largo*.

Adagio Assai or Molto (It.).—Very slow and expressive.

Adagio Cantabile e Sostenuto (It.).—Very slow, singing and sustained.

A Deux (Fr.); **A Due** (It.).—A direction in orchestral music to indicate that two instruments are to play the same notes. Opposite of *divisi*.

Ad Libitum (Lat.).—At will or discretion. This expression implies that the time of some particular passage is left to the pleasure of the performer; to include or omit an instrumental or vocal part or voice so marked; or that he is at liberty to introduce whatever embellishments his fancy may suggest.

Affettuoso, Affettuosamente, or Con Affetto (It.).—With tenderness and pathos.

Affrettando or Affrettate (It.).—Accelerating, hurrying the time.

Agitato or Con Agitazione (It.).—With agitation, anxiously.

Al (It.).—A prefix meaning “to the”; hence *al fine*, to the end.

Alla (It.).—A prefix meaning “in the style of.”

Alla Breve (It.).—A tempo mark which indicates that in common time the half-note is to be regarded as the unit of time, rather than the quarter-note. In other words, 2/2 rather than 4/4. The tempo mark is usually .

Allegremente (It.).—Brightly.

Allegro (It.).—See separate article.

Al Segno, Al Seg., or the character “S”.—Signifies that the performer must return to a similar character in the course of the movement, and play from that place to the word *fine*, or the mark over a double bar.

Alt or Alta (It.).—Higher; as *Ottava Alta*, an octave higher.

Altissimo (It.).—Extremely high as to pitch.

Alto (It.).—Literally, high, but in modern usage a female or boy's voice of low range (also called *contralto*), or the second highest part of a four part mixed chorus. Also, in French and Italian, the viola.

Amabile (It.).—Amiably.

Amoroso, Amorevole, or Con Amore (It.).—Affectionately, tenderly.

Andante (It.).—This term often modified, both as to time and style, by the addition of other words, broadly implies a movement somewhat slow and sedate, but in a gentle and soothing style.

Andantino (It.).—Somewhat slower than *andante*.

Animato, Con Anima or Animoso (It.).—With animation; in a spirited manner.

Anthem.—A sacred choral composition, generally composed to Biblical text.

- Antiphonal Singing.** Singing in alternating choruses, particularly in polyphonic music composed for a double chorus.
- A Piacere or A Piacimento** (It.). At the pleasure of the performer; (see *Ad libitum*)
- Appassionato or Appassionamento** (It.). -With intensity of feeling.
- Appoggiatura** (It.). A grace note or note of embellishment which as a passing tone precedes an essential tone on an accented part of a measure.
- A Prima Vista** (It.). At first sight.
- A Quatre Mains** (Fr.); **A Quatro Mani** (It.).—For four hands; a pianoforte duet
- Ardito** (It.). Boldly, energetically.
- Aria** (It.).—An air, or song.
- Arioso** (It.). - In the style of an air; vocal, melodious.
- Arpeggio** (It.). An imitation of the harp produced by playing the notes of a chord in rapid succession, instead of altogether.
- Assai** (It.). Very, extremely.
- A Tempo** (It.).— Indicating a return to normal tempo following deviations.
- Attacca or Attacca Subito** (It.). -Attack suddenly or commence immediately.
- A Vista** (It.). At sight.
- Bar.** See separate article.
- Barcarole or Barcarolle.** -See separate article.
- Bass.** See separate article.
- Beat.** See separate article
- Beats.** An acoustical effect caused by the interference of two sound-waves of different frequencies. For Helmholtz theory of *beats* as related to dissonance see separate article on *ACOUSTICS*.
- Begleitung** (Ger.).—An accompaniment.
- Bel Canto** (It.). - Literally "beautiful singing." Denotes a style of singing which emphasizes beauty of sound and brilliant execution.
- Ben or Béne** (It.). Well; as *ben marcato*, in well-marked time.
- Bis** (Lat.).—Twice; indicating that a note or passage must be performed twice.
- Bolero** (Span.).—See separate article.
- Bouffe.** See *Buffa*.
- Bravura** (It.).—See separate article.
- Breve.**—See separate article.
- Brillante** (It. and Fr.).—An expression indicating a showy and sparkling style of performance
- Brio, Con** (It.). -With life and spirit.
- Buffa, Buffo, Bouffe** (It., Fr.).—Comic; as *opera buffa*, *opéra bouffe*, a comic opera.
- Cadence** (Fr.).—See separate article.
- Cadenza.**—See separate article
- Calando** (It.). Gradually diminishing in tone and quickness; becoming softer and slower by degrees.
- Calcando** (It.). Pressing on, hurrying the time.
- Calmato** (It.).—With tranquility, repose.
- Calore, Con** (It.). With much warmth and animation.
- Canon.**—See separate article.
- Cantabile.**—See separate article.
- Cantata.**—See separate article.
- Canticle.**—The name given to certain hymns with Biblical texts and used in church services, such as the Benedictus, Magnificat, Nunc Dimittis, etc.
- Cantilena.** See separate article.
- Cantor.** A solo singer, generally applied to the leading soloist in the Jewish service.
- Cantus** (Lat.).—In medieval and Renaissance music the upper (soprano) part of polyphonic compositions.
- Cantus Firmus.**—See separate article.
- Canzone or Canzona.** See separate article.
- Canzonet or Canzonetta.** - See separate article.
- Capo** (It.).—The head or beginning See separate article *DA CAPO*.
- Cappella, A** (It.). In church style
- Capriccio, Capriccioso or Capriccietto** (It.).— See separate article *CAPRICCIO*
- Carol.** -See separate article.
- Cavatina.** See separate article.
- Chant.** See separate article.
- Choir.** See separate article
- Choral or Chorale.** See separate article.
- Chord.** See separate article.
- Chromatic.** -See separate article.
- Clef.**— See separate article
- Coda** (It.). A few bars added at the close of a composition, beyond its natural termination.
- Col, Coll', or Colla** (It.).—With; as *col arco*, with the bow
- Colla Voce** (It.). Implies that the accompanist must follow the solo voice when performing in free rhythm.
- Commodo or Commodamente** (It.). Quietly, with composure
- Common Time or Common Measure.**—See separate article.
- Con.** With See also separate article.
- Concerto.** See separate article.
- Concord.** See separate article *DISSONANCE*.
- Consonance.**—See separate article *DISSONANCE*.
- Contralto.** - See *ALTO*.
- Counterpoint.**—See separate article.
- Da Capo, abbr. D.C.** (It.).—See separate article
- Dal** (It.).— By; as *dal segno*, from the sign; a mark of repetition.
- Deciso** (It.).—With decision, holdly.
- Decrescendo** (It.). Gradually growing softer.
- Delicatamente or Delicato.** Delicately; *con delicatezza*, with delicacy of expression
- Descant.**—In hymn singing, an added melody for treble voices, sung above the principal melody.
- Dextra** (Lat.).— Right; *manus dextra*, the right hand *manu dextra* (*M.D.*), with the right hand.
- Diapason.** - See separate article.
- Diatonic.**—See separate article.
- Dilettante.**—See separate article.
- Diminuendo, abbr. Dim.** (It.).—Diminish gradually in loudness.
- Discord.**—See separate article *DISSONANCE*.
- Dissonance.**—See separate article.
- Divertimento** (It.).— A short light instrumental composition.
- Divisi** (It.).—Direction in orchestral music indicating that two or more instruments are to play different notes, opposite of *à deux*.
- Dolce.** -See separate article.
- Dominant.** -See separate article.
- Elegante or Elegante** (It.).— With elegance.
- Empfindung, Mit** (Ger.).—With emotion, passion.
- Energico, con Energia or Energicamente** (It.).—With energy.
- Enharmonic.**—See separate article.
- Espressivo or Con Espressione** (It.).—With expression
- Extravaganza.**— See separate article.
- Falsetto.**—See separate article.
- Fandango.**—See separate article.

- Fantasia.**—See separate article.
- Fifth.**—See separate article.
- *Figured Bass or Thorough Bass.** See separate articles, **FIGURED BASS** and **BASS**.
- Forte (It.).**—Loud; see also separate article.
- Fortissimo.**—Very loud.
- Forzando, abbr. Forz or Fz (It.).**—Same as *sforzando*.
- Fretta, Con (It.).**—With speed, hastily.
- Fugue.**—See separate article.
- Fundamental Bass.**—See separate article **BASS**.
- Fuoco, con or Focoso (It.).**—With fire, intense animation.
- Galop.**—A rapid dance of the mid-19th century.
- Gamut.**—See separate article.
- Gavotte or Gavot.**—See separate article
- Gebunden (Ger.).**—Tied or connected in regard to the style of playing or writing
- Giocosamente, Giocosco or Giojoso (It.).**—Humorously; playfully; with sportiveness.
- Giusto (It.).**—In just and exact time.
- Glee.**—See separate article
- Glissando or Glissicato (It.).**—In a gliding manner.
- Grandioso (It.).**—In a grand and elevated style.
- grave (It.).**—Slow, solemn, also low in pitch.
- graziosamente, Grazioso or Con Grazia (It.).**—In a graceful and graceful style.
- Gregorian Chant.**—See separate article
- Gusto, Gustoso or Con Gusto (It.).**—With taste.
- Harmonics.**—See separate article.
- Harmony.**—See separate article.
- Hauptsatz (Ger.).**—The principal subject or theme.
- Hauptstimme (Ger.).**—A principal part.
- Hexachord (Gr.).**—The six diatonic tones forming the Guido scale.
- Homophonic.**—Designating music in which a single melodic part is supported by a choral accompaniment. Opposite of *polyphonic*.
- Improvisation.**—Performing extemporaneously, without preparation or the use of written music; a composition in free style, giving the effect of improvisation on the part of the performer.
- Intermezzo (It.).**—Originally a short, light opera, performed between the acts of a serious play or opera; an instrumental interlude; a short instrumental piece.
- Interval.**—See separate article.
- Intoning.**—See separate article.
- Inversion.**—See separate article.
- Key.**—See separate article.
- Kyrie.**—See separate article **KYRIE ELEISON**.
- Larghetto.**—Slower than *largo*.
- Larghissimo.**—Extremely slow.
- Largo.**—See separate article.
- Leading Tone.**—See separate article.
- Lebhaft (Ger.).**—Lively.
- Legato (It.).**—In a smooth and connected manner; *legatissimo*, exceedingly smooth and connected.
- Leggiero or Con Leggerezza (It.).**—With lightness and facility of execution.
- Leitmotiv or Leitmotif.**—See separate article.
- Lentando.**—With increased slowness.
- Lento (It.).**—In slow time.
- L'istesso (It.).**—The same, as *l'istesso tempo*, the same time.
- Loco (Lat.).**—Implies that a passage is to be played just as it is written in regard to pitch; it generally occurs after 8va alta or 8va bassa.
- Lusingando (It.).**—Soothingly, persuasively.
- Lustig (Ger.).**—Gay, sportive.
- Ma (It.).**—But, as *allegro ma non troppo*, quick but not too much so.
- Madrigal.**—See separate article.
- Maestoso (It.).**—With majestic and dignified expression.
- Magnificat.**—See separate article.
- Main (Fr.).**—Hand, as *main droite, main gauche*, or *M.D., M.G.*, the right or left hand in piano music.
- Major.**—See separate article
- Mano (It.).**—Hand, *mano dritta*, the right hand, *mano sinistra*, the left hand.
- Marcato (It.).**—In a marked and emphatic manner; *marcatissimo*, very strongly marked.
- Marziale (It.).**—In a martial style.
- Matins.**—See separate article.
- Mazurka.**—See separate article.
- Measure.**—See separate article.
- Melodrama.**—See separate article.
- Melody.**—See separate article.
- Meno, abbr. Men. (It.).**—Less; as *meno presto*, less quick; *meno forte*, less loud; *meno piano*, less softly, *meno vivo*, with less spirit.
- Messa di Voce (It.).**—A swelling and diminishing of the voice on a long holding note
- Mesto (It.).**—Mournfully, sadly, pathetically.
- Metronome.**—An instrument invented by Malzel in 1816 for determining the exact tempo of a composition. See also separate article
- Mezzo, Mezza (It.).**—Half; *mezzo forte*, half, or moderately loud, *mezzo legato*, moderately legato, *mezza voce*, with half voice, or moderate in tone.
- Mezzo Soprano (It.).**—A female voice of a lower pitch than the soprano or treble, but higher than the alto.
- Minuet.**—See separate article.
- Mode.**—See separate article
- Modulation.**—See separate article.
- Molto (It.).**—Very, extremely; as, *molto allegro*, very quick; *molto adagio*, extremely slow.
- Monophonic.**—Music with a single melodic line without accompaniment.
- Mordent or Mordente (It.).**—A melodic ornament, in which the written note alternates with the note immediately below it.
- Morendo (It.).**—Gradually subsiding in regard to tone and time; dying away
- Mosso (It.).**—Movement; as *piu mosso*, with more movement, quicker, *meno mosso*, slower.
- Motive or Motif.**—The melodic basis of a theme or melody. It may consist of as few as two notes. See also separate article **LEITMOTIV**.
- Moto or Con Moto (It.).**—With motion, agitation, energy, and animation.
- Music.**—See separate article.
- Mute.**—A device for muffling the tone of an instrument. See *Sordino*.
- Nachdruck (Ger.).**—Emphasis, accent.
- Obbligato (It.).**—Literally, and correctly, this term means "obligatory," designating instruments or parts which must not be omitted. It is often carelessly used for an accompanying part which may be omitted, for which the correct term is *ad libitum*, actually the opposite of *obbligato*.
- Octave or Ottava.**—See separate article **OCTAVE IN MUSIC**.
- Offertory.**—See separate article.
- Opera.**—See separate article.
- Opera Buffa.**—See *Buffa*.
- Oratorio.**—See separate article.
- Orchestra.**—See separate article.
- Organ.**—See separate article.

Overture.— See separate article.

Parlando or Parlante (It.).—In a speaking manner; accented, as if with words in a declamatory style.

Pastorale. See separate article.

Pesante (It.).—With weight and importance, impressively.

Piacere (It.).—Will, pleasure; as *a piacere*, at the performer's pleasure in regard to time.

Pianissimo.—See separate article.

Piano. See separate article.

Pianoforte. See separate article PIANO.

Pietoso (It.). With pity, compassionately.

Pitch. See special article.

Più (It.).—More, an adverb of augmentation; as *più presto*, quicker.

Pizzicato or Pizz. (It.).—In violin or violoncello music, the plucking of strings with the finger, instead of playing with the bow.

Placido (It.).—Peaceful

Poco (It.).—A little, rather, somewhat; *poco a poco*, by degrees, gradually; *pochetto*, *pochettino*, a little, as *ritard*; *un pochettino*, play somewhat slower.

Poggiato (It.).—Lwelt upon, impressive

Poi (It.). Then; as *piano poi forte*, soft, then loud.

Polonaise. See separate article

Polyphony.—See separate article.

Portamento (It.). A smooth gliding from one tone to another

Precentor. —Leader of a church choir or of singing by the congregation.

Prelude.—See separate article.

Presto (It.). Very quick; *con prestezza*, with rapidity; *prestissimo*, the most rapid degree of movement.

Prima Vista.— See *A Prima Vista*.

Primo (It.).—First; as *tempo primo*, in the first or original time

Quasi (It.).—As if; almost.

Quieto (It.).—With calmness or repose; quietly.

R. or R.H.—Indicates the right hand in pianoforte music.

Rallentando (It.).—A gradual diminution in the speed of the movement.

Recitative or Recitatif.—See separate article.

Resolution.—The concord which necessarily follows a preceding discord.

Rhythm.—The succession of regular or irregular pulsations caused by the succession of strong and weak beats.

Ricercari (It. plur.). Difficult exercises, usually fugal, for the voice or for some instrument

Ricordanza (It.).—With recollection, remembrance.

Rinforzando or Rinforzato, abbr. Rinf. or Rf. (It.).—With additional tone and emphasis.

Ritardando, Ritardato, or Ritenente (It.).—A gradual retarding and decrease in the speed of the movement.

Ritenuto (It.).—An immediate reduction of speed.

Rondeau or Rondo. See separate article.

Round.—See separate article.

Rubato or Robato (It.).—Robbed, borrowed. *Tempo rubato* is applied to a style of performance in which the interpreter, to express some emotional mood, holds some notes longer than their legitimate time, curtailing others of their proportionate durations in order that, on the whole, the aggregate value of the bar may not be disturbed.

Sanctus.—See separate article.

Saraband.—See separate article.

Scale.—See separate article.

Scherzando (It.).—In a light, playful and sportive manner.

Scherzo (It.).—An instrumental piece, in which gay, animated sections are alternated with those of more serious nature. A movement of a symphony, sonata, or quartet, introduced by Beethoven to replace the minuet.

Sdruciolato (It.).—Sliding or gliding the finger along the keys, or strings of an instrument; same as *glissando*

Segno or \$ (It.).—A sign; as *al segno*, return to the sign; *dal segno*, repeat from the sign.

Segue or Seguito (It.).—Now follows, or as follows; *segue il coro*, the chorus follows; *segue la finale*, the finale now follows. It is also used in the sense of in similar or like manner, to show that a subsequent passage is to be played in the same manner as that which precedes it.

Sempre (It.).—Always; *sempre staccato*, always staccato or detached; *sempre forte*, always loud; *sempre più forte*, continually increasing in force.

Senza (It.).—Without; as *senza pedale*, without pedals.

Serenade.— See separate article.

Sforzando or Sforzato, abbr. Sf. (It.) Implies that the note so marked is to be played with particular emphasis or force. Same as *forzando*.

Sinistra (It.).—Left; *mano sinistra* (M.S.), with the left hand.

Sino, abbr. Sin' (It.).—As far as.

Smorzando (It.). Dying away.

Solfaing.— See separate article.

Solfeggio. See separate article.

Solmization.—A term for systems of designating the degrees of the scale by syllables rather than letters. See separate article SOLFEGGIO.

Sonata.—See separate article.

Soprano.—The highest female voice. Also a boy's unchanged voice, or in former times, the voice of the male soprano, or *castrato*.

Sordino (It.).—Mute; *con sordino*, with the mute.

Sospirando (It.). Sighingly, plaintively.

Sostenuto, abbr. Sost. (It.).—Sustained, continuous in regard to tone.

Sotto (It.).—Below, under; as *sotto voce*, in an under tone.

Stabat Mater.— See separate article.

Staccato (It.).—Implies that the notes so marked are to be played so that they are distinct, short, and detached from one another; *staccatissimo*, very detached

Strepito or Strepitoso (It.). In a noisy, boisterous manner, for some particular effect.

Stretto (It.).—That part of a fugue in which the subject and answer succeed one another during a very short interval of time. In modern music it is sometimes used to imply an acceleration of the tempo near the close of the piece.

Stringendo (It.).—Accelerating the tempo.

Symphony.—See separate article.

Syncopation.—See separate article.

Tanto (It.).—Much; *non tanto*, not too much.

Tarantella.—See separate article.

Temperament.—See separate article.

Tempo.—See separate article.

Teneramente, Tenero, or Con Tenerezza (It.).—Tenderly.

Tenuto or Tenue, abbr. Ten. (It.).—Implies that a note or notes must be held or sustained.

Theme.—See separate article.

Thorough Bass.—See separate article FIGURED BASS.

Timbre.—The quality or color of a tone.

Toccata (It.).—Literally, touched; a piece for a keyboard instrument, generally brilliant in style.

Tone.—See separate article.

Tonic.—See separate article HARMONY.

Transposition. See separate article.

Traurig (Ger.).—Sad.

Treble.—The highest part of a choral composition; the upper parts in concerted instrumental music.

Treble Clef. The G clef on the second line of the upper (treble) staff.

Tremolo (It.). A vibrating or tremulous effect, produced by the human voice, and on certain instruments.

Triad See separate article **CHORD**.

Trill See separate article.

Trio See separate article.

Triplet. See separate article.

Troppo (It.).—Too much; *allegro non troppo*, not too fast.

Turn An ornament in which the higher and lower adjacent tones alternate with the principal tone.

Tutti (It. plur.). All; a term used to point out those passages where all the voices, or instruments, or both, are to be introduced.

Una Corda (It.). A direction to use the left (soft) pedal in piano playing, thus causing the hammer to strike one, or sometimes two, strings.

Upbeat An unaccented part of a measure; one or several initial notes of a melody which occur before the first bar-line.

Veloce (It.). In rapid time; *velocissimo*, with extreme rapidity.

Vibrato (It.). On stringed instruments played with a bow, a slight alteration of pitch caused by a rapid oscillation of the finger pressing the string. In singing, a tremulous effect, caused by a series of rapid interruptions of tone.

Vista See *A Prima Vista*; *A Vista*.

Vivace or **Vivamente** (It.). With briskness and animation.

Vivo (It.).—Lively, vivaciously.

Vocalize. To sing an extended melody on a vowel, without text.

Volante (It.).—Light, swift.

Volta (It.).—Literally, time; *prima volta* and *seconda volta* indicate the first and second endings of a section that is to be repeated.

Volte Subito, abbr. **V.S.** (It.).—Turn over the page quickly.

Voluntary.—An organ piece, to be played in connection with a church service.

Bibliography.—Baker, T., *Dictionary of Musical Terms* (New York 1902); Thompson, O., ed., *The International Encyclopedia of Music and Musicians* (New York 1941); Apel, W., *Harvard Dictionary of Music* (Cambridge, Mass., 1947).

Revised by

JOHN TASKER HOWARD.

MUSICAL INSTRUMENTS were not "invented." They developed slowly and comparatively late—much later than singing. They developed from rhythmically moving limbs, from stamping feet and slapping hands; the hands and feet were replaced by more effectual devices—wooden clapper-sticks or pounding bamboos—or the ground to be stamped upon yielded to some covered pit in the earth or to a felled and dug out tree. Such simple contrivances and the rattles that shook from the dancers' ankles or in women's hands were the beginnings of the first large class of instruments, which scientific classification calls the idiophones, or instruments of materials sonorous by nature without needing any artificial tension such as do strings and drumskins. Most of them are struck; but a good many are pounded, shaken, scraped, plucked, or even rubbed.

As a second class, primitive tribes created

the aerophones, from the air which constitutes their main vibrating agent. A minority of them are "free"; that is, some contraption like a propeller stirs the open air. Such is the widely spread "bull-roarer," a slab of wood whirled around the player's head on a thread. The majority, however, are wind instruments in the common sense, with the air vibrating inside a slender tube.

Most wind instruments belong to the families of flutes and of trumpets, though only in a general way. The flutes are often mere whistles of bone or reed without fingerholes, capable only of a single, screaming note; and the trumpets, roughly made of hollow stems or branches, are often used as megaphones, to be spoken, shouted, or wailed into, or to mask the player's natural voice. Such masking of the natural voice is one of the strongest indications that the instruments of the primitive peoples were not so much tools of music, in the sense that we give this word, but rather magical charms. Tied into a complicated network of cosmological ideas and symbols, of sun and moon, of male and female, of fire and water, they were supposed to help, with their characteristic sounds and shapes, in driving away malevolent demons and in creating life, growth, and bliss.

The densest network of such connotations surrounds the instruments of the third class, the membranophones or drums, where a bladder or skin, to be struck or to be rubbed, is tightly stretched across an opening. Many are kept as sacred idols and receive veneration and sacrifices. Their outer forms are numberless and betray, in all their variety, the derivation from two principal sources: the carved and hollowed tree and a lathed, earthen store pot. (Our modern military drums are ultimate offsprings of the tree, and our kettledrums of the earthenware pot.) Apart from them, the frame drums (popularly called tambourines) have no actual bodies, but only hoops to serve as frames for the skins.

The fourth class, chordophones or stringed instruments, reach, in the primitive world, only preparatory stages. Most of them share their forms with the hunter's bow, and a few, with swinging traps for big game (where a flexible rod in the ground stretches a rope descending from its loose end to a covered pit). Other forms of stringed instruments that we might find among the primitives seem to be degenerated types sunken down from higher civilizations rather than early developments.

In the high civilizations of the ancient Orient, the magic connotations grow weaker, but by no means disappear. Instead, a real instrumental music, quite rudimentary in primitive cultures, becomes independent and increasingly important. The two classes of idiophones and membranophones yield a good deal of their earlier preponderance to strings and wind instruments capable of playing melodies. The wind instruments form sets of tubes (panpipes), one for each note; or, the player produces these notes by stopping the fingerholes of one single tube. The stringed instruments, in a similar way, have as many strings as there are notes required. They are called open strings; or, the players produce these notes by stopping one single string at different places.

The earliest of the new, resourceful stringed instruments were the harp and the lyre. The harp, deriving from the musical bow had, as its

scientific definition reads, the plane of the strings vertical on the plane of the soundboard. The neck emerged from the end of the body, bent forward, and sent the strings down to the soundboard (instead of emerging straight from the body, as in the violin, and dismissing the strings almost parallel to the soundboard). The lyre, on the contrary, had a yoke with arms and cross-bar instead of a neck to hold the strings. The harp spread from ancient Egypt to China and was evidently the only stringed instrument in India. The lyre, on the other hand, did not penetrate either to China or to India, but was confined to the Mediterranean and the neighboring corner of Asia. It became the principal instrument in ancient Israel (David's "harp" as a translation of Hebrew *kinnor* is a misnomer) and later in Greece, Etruria, and Rome. The *kithara* of the Greeks was the heavy, carefully joined instrument of professionals; their *lyra* was a lighter variety for the benefit of beginners and amateurs. East Asia never saw the lyre; nor did it assign any important role to the harp. Instead, it devised a zither (or neckless stringed instrument) in a lengthy rectangular form with silken strings to be tuned by triangular shiftable bridges. It is still alive and highly esteemed as the *ch'e* of China and the *koto* of Japan.

Around 2000 B.C., some country in or near Asia Minor produced the lute, consisting of a resonance body with a neck on which the various notes of the melody were "stopped" by pressing the fingers on the proper places of one string or two. This family, from which derive the lutes all over the central belt, from Japan to Spain, became particularly important because it led to the discovery of an exact mathematical fixation of musical intervals: the octave had to be stopped right in the middle of the string (ratio 2:1); the perfect fifth at two thirds (3:2); the perfect fourth at three quarters (4:3); the major third at four fifths (5:4); and the minor third at five sixths (6:5), and so forth. Hence, the name *kanon* or rule that the Greeks bestowed on it.

Almost all the stringed instruments were plucked, either with bare fingers or with an artificial *plektron* of some kind. Bowing, which probably started in central Asia, became known only thousands of years later; its earliest evidences date from the end of the first millennium A.D., and the "fiddler Nero" has no historical backing.

Wind instruments played a minor role in the ancient Orient. But while the various types of flutes were known all over the world, reed pipes became the almost exclusive property of the Mediterranean and the southwest of Asia, including India. They were either clarinets, with single reeds to interrupt the player's wind, or oboes, with double reeds as the mouthpiece. Both kinds were usually blown in pairs with the mouthpieces inside the mouth at the same time. Mostly, one pipe seems to have played the melody, and the other pipe a sustained "drone" or pedal note, as do our bagpipes. Those double pipes were indeed quite closely related to our bagpipes. For the player's mouth, like that of a glass blower, was kept independent from regular respiration and used as a wind chamber or bag, while the nose took care of breathing in and out and of feeding the mouth as much as necessary. Later, some types of reed instruments, for example, the Indian snake charmers' pipes, facilitated this method by inserting the tubes in

a calabash to serve as an artificial wind chamber, and still later, some instruments replaced the rigid calabash by a flexible bladder or skin and became bagpipes. Incidentally, the translation of the word *sumponiah* in the Book of Daniel by "bagpipe" is erroneous: our earliest evidences of bagpipes date from the Christian era.

Horns and trumpets had two manufacturing centers: one was Mongolia, which fed all Asia and later, even Europe; the other was Etruria, which fed the Grecian world and Rome, especially the Roman Army.

The idiophonic class developed, in east Asia, an important family of chimes, or sets of well-tuned sonorous bodies, of bamboo tubes or wooden slabs (xylophones), of porcelain bowls, of metal slabs (metallophones—from which our modern celesta stems), or gongs (gong chimes), and of bells (bell chimes or carillons). Several of them have found their way to the West.

Even drums, at least in Burma, have been united to form chimes within a trellis round about the drummer, who performs complicated pieces with incredible dexterity. For the rest, the progress made in drums consists, in the Orient, in size rather than in quality.

In musical instruments more than in any field, Europe proved to be a peninsula of Asia. We do not know how the harps and lyres prevalent in the north were imported—through northern Asia or via the Atlantic sea route. All other instruments were imported, either through Byzantium, the gateway of the East, or through the Mohammedan conquest of Spain in 711. Among them were the ancestors of all our modern instruments: violins, lutes, and guitars; zithers, from which, much later, the stringed keyboard instruments derived; flutes, oboes, and clarinets; trumpets, horns, and kettledrums. Among them was also the organ. It had been invented in antiquity at a time unknown—the famous model of a hydraulic organ by the Alexandrian, Ktesibios, was, obviously, only the invention of a certain type of organ, not of the organ itself. The clergy opposed it in early Christian times, but accepted it long before 1000 A.D. By this time, it had so much increased in size that the organ of the monastery at Winchester, England, in 980 had no less than 26 bellows and 400 pipes, and required two players. But one should not fancy these organs to have had keyboards in a modern way or register stops to change intensity and color. They all were so-called mixture organs, in which every note was automatically accompanied by higher octaves and fifths—by 10 of them in Winchester, and in later organs, up to 20. Only in the 14th century did the organ change its principle: it was given several keyboards and even pedals, modern keys, and solo stops of different tone color. Rightfully, the greatest composer of the time, Guillaume de Machaut, could call it the king of all the instruments.

In the same century, we hear for the first time of stringed keyboard instruments, such as clavichords and virginals (qq.v.). Their invention was indicative of a growing trend to play chords. A little later, the short-necked lute, introduced many centuries before from Persia, came of age as a Western instrument: its technique, which had been strictly melodic in the Orient, changed to the playing of several strings at a time in chords as well as in counterpoint. With this new technique, the lute was able to

under, with more or less accuracy, all compositions written for voices or instrumental ensembles, and thus attained a dominant position in the home comparable to that of our piano.

The 15th century departed from the medieval habit of compressing high and low voices into a medium range that allowed all of them to participate wherever they wanted. The new style—combining high, medium, and low voices in their proper ranges and at proper distances from each other led to an extension of musical space upward and downward and, consequently, to the construction of musical instruments of high, medium, and low tessitura. From the 15th century on, the more important instruments were built in complete families of sopranos, altos, tenors, and basses, such as soprano recorders, alto cromornes, tenor flutes, and bass fiddles. Indeed, in 1493, some Spanish musicians wondered at viols as tall as men which they had seen in Rome; they were double basses.

The 16th century delighted in creating as many different and contrasting tone colors as possible—many more than we use or know today. This resulted in an astonishing number of instruments built in whole families, from sopranos down to bass and doublebass sizes, and, particularly, of flutes and double-reed instruments such as bassoons, cromornes, shawms, *rauschpfeifen*, ankets, and others. The most curious among them were the rankets: quite short and thick, slanders of wood or ivory, in which the wind canal was led through ten alternately ascending and descending bores. Most of these reed instruments had wooden caps to conceal the reeds and make them inaccessible to the lips. They served wind chambers similar to the bags of bagpipes. As a consequence, they were not able to overblow into higher octaves or to change from one note to piano.

We are indebted to the 16th century, also, for having created, out of a confusing crowd of sizes, types, and shapes, the two most important families of bowed instruments: the *viola da braccio* or violins and the *viola da gamba*. (In English usage, *viola*—the singular of *viola*—means today an alto size of the violin family, while the members of the now extinct *gamba* family are referred to as the viols.) The characteristics of the violin family—violin, viola, violoncello or simply cello, and double bass—are too well known to need a redescription. It may just be stated that in the first decades of its existence the highest string was missing on all the members of the family, and that, down to the end of the 18th century, the neck was about half an inch, and the fingerboard several inches, shorter than they became in the 19th century. (All the older specimens still in use have been changed to the present lengths.) The viols, basically similar, had a deeper body, a flat back and six or seven strings essentially thinner than those of the violin family. The commonest size, close to that of the cello, was held between the legs, and the smaller sizes, upon the legs, not against the shoulder (whence the name *viola da gamba*, or leg fiddle). Unlike the bowing of violins and their next of kin, the bowing was done with the palm of the hand upwards and with the accented beats towards the pointed end of the bow. The tone itself was cool, silvery, and reserved. These traits account for the long-lasting discrimination between the two families, the viols being considered aristocratic chamber instruments, and the violins vulgar

dance instruments. Only Italy, homeland of the violin and its greatest makers, decided, as early as c. 1600, in favor of the new family and discarded the other bowed instruments almost entirely.

The 17th century also neglected the wind instruments, mainly because their windcaps hindered them from being flexible enough to follow the novel emotional style of the time. The violin family reigned supreme. Only at the end of the century did the wind instruments begin to be popular. Still, the violin family remained unchallenged as the kernel of the orchestra and of chamber music down to the 20th century, and it has preserved this central position essentially to the present.

The rehabilitation of wind instruments as the characterizing elements of the score, as opposed to the more neutral tints of the strings, came from France in Jean Baptiste Lully's time (c. 1660). The military fife, the military shawm, and the hunters horn were transformed into the flute, the oboe, and the French horn, and obtained seats in the orchestra. One generation later, a German master, Johann Christoph Denner, made the clarinet out of a rarely used folk pipe.

The trumpet was late in joining the orchestra, partly because the self-styled "knightly" guild in which the trumpetists were organized precluded, or at least discouraged, any cooperation with ordinary musicians. Whenever composers insisted on calling them in, the customary group of three trumpetists and one kettledrummer were kept apart, often above the orchestra, and entrusted with a special festive passage without merging with the orchestra proper. However, the guilds were doomed, and the orchestra needed, more and more, the collaboration of brass instruments. As far as was proper and possible, composers used trombones, which, owing to their gliding mechanism, could instantaneously change the length of the tube and, hence, produce a complete chromatic scale. But the trumpets and French horns were thrown upon the few skeletal notes that overblowing provided. Substitutions were tried; thus, we find in Johann Sebastian Bach's scores, for example, a slide trumpet, which, by pulling out the tube in trombone fashion, allowed for all the chromatic notes unobtainable on ordinary trumpets; and, also, the already obsolete *cornetto* or *zink*, which was a rather short and slightly curved wooden horn with fingerholes like those of an oboe. The hornists found a way to flatten at least the skeletal notes by "stopping" their fist into the widened end or bell of the instrument; but the notes thus obtained proved to be inferior in tone quality. Hornists and trumpetists also tried out a fingerhole and key system similar to that of the *zinken* (key horns, key trumpets). But the interruption of the otherwise homogeneous metal tube was not satisfactory either. The solution of the problem, definitive so far, came in the second decade of the 19th century with the invention of the valves (either pistons or rotary valves), that is, additional lengths of tube, to be connected or disconnected with the speed of a piano key and to thus transform the original length of the instrument into any length necessary for producing a full chromatic range. This new versatility allowed the trumpets and horns to merge in the rest of the orchestra and to give it color and an intensity unheard before; mod-

ern orchestration scores as many brass instruments as woodwinds, or even more.

The 19th century added a few more families of brass instruments beside the trumpets, horns, and trombones: the cornet, developed from the old postilion's horn; its relatives, the alto horn, the baritone, the euphonium, and the tuba; and, as a rare supplement for solemn passages, the Wagner tubas, hybrids between the French horn and the ordinary tuba.

The woodwinds, too, in the 19th century were built in whole families reminiscent of those of the 16th century: the flutes were given altos and basses; the oboes, English horns (altos) and baritones; the clarinets, altos, basses, and double basses; the bassoons, double bassoons. The new basses and double basses posed new problems; the fingerholes were spaced beyond the reach of the fingers and needed a complicated key mechanism with double levers. However, the whole conception of fingerholes and keys was entering a new stage, best known from Theobald Boehm's construction of the modern flute in 1832, where the fingerholes were not placed at the convenience of the hands, but according to acoustical laws, while easy fingering was safeguarded through an ingenious system of keys.

Not much later, a resourceful instrument maker in Brussels and, thereafter, in Paris, Adolphe Sax, in about 1840 added a new family under the name of saxophones (q.v.): brass clarinets with wide parabolical tubes and bent-up bells in all sizes except the straight soprano.

Sax also improved an impressive number of other wind instruments, both wood and brass, and built a new family of brasses, known as the saxhorns, (see HORN), which are more or less the cornets and the tubas fused in one complete, homogeneous set.

Another Frenchman, the bandmaster, Sarrus, followed, around 1860, with the sarrusophones: a complete family of metal oboes, stronger and fuller than the orchestral oboes and bassoons. They are forgotten except for the double bass, which sometimes replaces the weaker double bassoon.

While Sax was working at his inventions, the organ builders developed a cheaper home and chapel surrogate, with reeds instead of pipes: the harmonium. The organ itself got rid of the fragile mechanical action that connected key and pipe by wooden trackers and stickers and adopted the British invention of a pneumatic action (Joseph Booth 1827 and Charles S. Barker 1832) which, among other advantages, made it possible to separate the keyboards from the pipework and to place them in churches or concert halls wherever the organist could be seated best. Later on, a part of this pneumatic action was even electrified (Barker 1868).

The harp, too, underwent its decisive and so far definitive improvement. Its seven pedals had been able to sharp its seven strings per octave by a semitone each and thus, theoretically, to make a complete chromatic scale available. Practically, they did not allow for playing in flat tonalities. Sébastien Érard in Paris, who gave the piano its modern action, transformed the single action into a double action in 1810: each of the seven pedals can be stopped midway to sharp the string by a semitone, and trodden all the way down to sharp the string by a whole-tone. In more recent times, so-called chromatic harps have been designed, for example, by Lyon

and Healy in Chicago, all of them with a complete chromatic range of strings and without pedals at all, but none of these models has been successful.

The present state is about this: the violin family has not changed, and old instruments from the 18th century are preferred to new ones; the piano is essentially the same as it was a hundred years ago; and this is more or less true of harps and wind instruments.

Meanwhile, an entirely new fifth class of instruments had been created: electrophones. Here tone is produced by electrical circuits, which are switched on either by the action of the hands or the fingers or, indirectly, by a keyboard of conventional form. The Theremin belongs in the first of these categories (1920); the Hammond organ (1935) in the second. (The reader should not confuse this real electric organ with modern pipe organs operated by an electrical action.)

MUSK DEER, mŭsk dĕr, *Moschus moschiferus*, a small deerlike animal which differs so greatly from other members of the deer family or Cervidae that it is placed in a special subfamily, the Moschinae. The distinguishing features include, among others, the presence of a gall bladder, a relatively unconvoluted brain and complete lack of antlers in both sexes. Other features, found in the males only, are a pair of long canine tusks in the upper jaw and a musk gland on the abdomen.

The musk deer is only 20 to 22 inches high at the shoulder, somewhat higher in the hind quarters. The legs are rather heavy and the feet are remarkable for the great development of the lateral toes, the hoofs of which touch the ground. The ears are long and the tail very short. The color is brown, more or less mottled with lighter patches, and the young are spotted. The pelage consists partly of coarse, bristly hairs with which are mingled shorter hairs of a woolly texture.

The musk deer is widely distributed throughout central and eastern Asia, and several local races or subspecies have been recognized. In the mountains, notably in the Himalayas, it is commonly found, in summer, at elevations of 8,000 to 12,000 feet. It extends westward into Kashmir northward to Kansu, China, and also occurs in Mongolia, parts of Siberia, and even Sakhalin Island. A subspecies is found in Korea, and a southern one inhabits Assam and Upper Burma and extends into French Indochina. In habit the musk deer is solitary, extremely wary, agile, and fleet-footed. It frequents thickets of birch, juniper and rhododendron in the daytime, feeding chiefly at morning and evening twilight and at night on grass, moss and leaves. Mating occurs in January and the young are born in June. The males are said to fight fiercely during the mating season, using as weapons the canine tusks which sometimes exceed three inches in length.

The feature to which the animal owes its popular fame is a saccular cutaneous gland called the musk pod, found in the male only. Located on the abdomen with an opening in front of the preputial aperture, the gland attains about the size of a hen's egg in the adult. The secretion in the pouch forms a semisolid mass of dark brown color and strong odor which, when dried and processed, yields the highly valued musk of commerce, used as a base for many perfumes. The animals are so persistently and ruthlessly

hunted for musk that they are in danger of extinction in some regions. See also CERVIDAE; DEER; PERFUMES; RUMINANTS.

Consult Flower, W. H., and Lydekker, R., *Mammals, Living and Extinct* (London 1891); Harper, F., *Extinct and Vanishing Mammals of the Old World* (New York 1945); Tate, G. H. H., *Mammals of Eastern Asia* (New York 1947).

MUSK OX, *Ovibos moschatus*, a remarkable member of the Bovidae (q.v.), is found only in Arctic regions of North America, including a number of the Arctic islands, and the northern coastal region of Greenland; but fossil remains show that during the Pleistocene ice age it extended as far southward as Kansas and Kentucky, and inhabited northern Europe and parts of Siberia. Regarding its zoological affinities, some mammalogists consider it most closely related to the bison, while others regard it as more nearly allied to the antelopes, goats, and sheep. The name *Ovibos* signifies "sheep ox."

The animal resembles a small ox with extremely long, shaggy hair which on the sides may hang almost to the feet. Mingled with the long hair is a dense woolly undercoat which is shed in the spring. The color is dark brown in general, paler on the back, and the feet are white. The horns are extremely broad at the base, especially in adult males, in which they almost meet in the midline, forming a heavy frontlet. They curve downward at the sides of the head, then upward and forward at the tips. There is only one species; but three races or subspecies, differing in minor features, are recognized. The musky odor is commonly considered to be a general emanation, though it has been suggested that the suborbital gland may be its source.

The musk ox feeds on grass, moss, sedge, and shoots and leaves of the dwarf willow, scraping the snow away with its hoofs when necessary. It is commonly found in herds of 10 to 30 animals. Though it wanders locally in search of food it is in no sense migratory. When attacked the herd quickly forms a compact circle with the young ones in the center and the horned adults facing outward. This affords adequate defense against wolves, the chief natural enemy, but against men armed with rifles it merely renders easy the annihilation of the herd. Continual ruthless slaughter by Eskimos, explorers, and sportsmen has greatly diminished the number of musk oxen and even exterminated them in many regions, so that the species is doomed unless efficient protective measures are enforced. The Canadian government has forbidden the killing of musk oxen and has established a sanctuary of 15,000 square miles northeast of Great Slave Lake. In 1930 the United States introduced a number of the Greenland subspecies into Alaska where the musk ox, formerly present, has been extinct since the middle of the 19th century. In 1942 the introduced animals, transferred meanwhile to Nunivak Island off the Alaska coast, had almost tripled their original number.

Consult Flower, W. H., and Lydekker, R., *Mammals, Living and Extinct* (London 1891); Hone, F., *The Present Status of the Muskox in Arctic North America and Greenland*, Special Publication, American Committee for International Wild Life Protection, Vol. 1, No. 5 (Cambridge 1934); Allen, G. M., *Extinct and Vanishing Mammals of the Western Hemisphere* (New York 1942); Cahalane, V. H., *Mammals of North America* (New York 1947).

MUSK PLANT, a popular name for several unrelated plants. The one most common to the United States is *Mimulus moschatus*, of the fam-

ily Scrophulariaceae, a native of the Western states. In Europe the name is most applied to *Erodium moschatum* of the family order Geraniaceae, a native of the Mediterranean region. The name is applied in the West Indies to *Guarea grandifolia*, a mahogany-like tree which is also known as muskwood; and to *Trichilia moschata*, also called musk tree. This name is also applied to a Tasmanian tree, *Olearia argophylla*. An East Indian plant, *Ferula sumbul*, is known as musk root. Its starchy roots are used as a substitute for musk in perfumery.

MUSK SHREW. See SHREW.

MUSK TURTLE, or STINKPOT. See TURTLES, TORTOISES AND TERRAPINS.

MUSK WOOD, a tree, *Guarea grandifolia*, of the family Meliaceae, so called in the West Indies because the bark smells so strongly of musk that it may be used as a perfume. Although the tree attains timber size the wood contains a bitter resinous substance which unfits it for many purposes.

MUSKEGON, müs-kē'gūn, city, Michigan, Muskegon County seat, altitude 590 feet, is located on Lake Michigan, at the mouth of Muskegon River, 35 miles northwest of Grand Rapids, on the Pennsylvania; Chesapeake and Ohio; and Grand Trunk railroads. It is a port of entry, and has water transportation on the Great Lakes, car ferry service to Milwaukee, Wis., and airline service. Among its manufactured products are airplane and automobile engines, billiard and bowling equipment, piston rings, motor castings, filing devices, gasoline pumps, and knit goods. It is one of the great oil refining centers of Michigan. Many of its buildings and civic institutions have been provided through the benefactions of Charles H. Hackley, wealthy lumberman and philanthropist.

The name Muskegon is of Indian origin, meaning "river with marshes." It was first settled as a trading post in 1810, was incorporated as a village in 1861, and re-incorporated as a city in 1869. The city has commission-manager form of government. Pop. (1950) 48,429.

MUSKEGON HEIGHTS, city, Michigan, Muskegon County, is located just south of Muskegon, on the Chesapeake and Ohio; Grand Trunk; and Pennsylvania railroads. It is a residential suburb of Muskegon, but shares in the industrial activity of the larger city. Pop. (1950) 18,828.

MUSKELLUNGE, müs'kē-lūnj, the great pike, *Esox masquinongy*, of the lakes of the interior of North America. See PIKE, PICKEREL.

MUSKET, a hand firearm with which infantry soldiers were formerly armed. When first introduced, early in the 16th century, it was discharged by means of a lighted match, and was so heavy that it had to be laid across a staff to be fired. To make use of it the soldier was required to carry a slow-burning match with him which was apt to be extinguished in wet weather. The wheel lock followed, the chief feature of which was a wheel made to revolve by means of a spring and to cause sparks by friction against a flint. The next improvement was

the flintlock proper (about 1625), in which sparks were produced by one impact of a piece of flint on the steel above the priming powder. Musketeers were soon introduced into all armies. In the beginning of the 17th century infantry consisted of pikemen and musketeers, and all changes in regard to the relative proportion of the two arms were always in favor of the latter. The flintlock musket was introduced into the British Army toward the end of the 17th century, and was the British musket of the days of the Peninsular War and Waterloo, known familiarly as "Brown Bess." It was superseded by the percussion musket in 1842, this musket being in turn superseded by the rifle. See **ARMS AND ARMOR**; **SMALL ARMS**.

MUSKETRY, the science and art of shooting small arms, particularly the musket or rifle.

MUSKINGUM, müs-kīng'gūm, river, Ohio, with a course of about 120 miles wholly within the state. It is formed by the junction of the Tuscarawas and the Walhonding, at Coshocton in the county of the same name, and it flows in a general southeast direction through a fertile valley to Marietta, where it joins the Ohio. The chief towns on its banks are Zanesville, McConnellsville and Marietta. It is navigable for 90 miles to Dresden, and has been extensively dammed for flood control.

MUSKINGUM COLLEGE, a coeducational institution at New Concord, Ohio, founded in 1837 under the auspices of the United Presbyterian Church. It is a college of liberal arts giving the A.B. degree; with an attendance of about 800, and occupying some 102 acres.

MUSKMELON. See **MELONS**.

MUSKOGEE, müs-kō'gê, city, Oklahoma; seat of Muskogee County; altitude 559 feet. It is situated 47 miles southeast of Tulsa, and is served by the Kansas, Oklahoma and Gulf, the Midland Valley, the Missouri-Kansas-Texas, and the St. Louis-San Francisco railroads. It has an airport, Hat Box Field, with airline service.

Natural resources of the surrounding region include cotton and deposits of lime, together with oil and natural gas; and the zinc fields are near enough to support the manufacture of zinc and lead products. The city deals extensively in dairy products, such as butter and cheese. Its industrial establishments make road machinery, cottonseed products, oil-well equipment, batteries, castings, aircraft, automobile parts, tools, furniture, radios and phonographs, and paper and leather products.

Muskogee has public elementary and high schools for both white and Negro pupils, and parochial schools. It is the seat of a state school for the blind, and a veterans hospital. There is a public library, an art gallery, a city museum, a city hospital and the Eastern Oklahoma Hospital.

The city was settled about 1810 as a fur-trading center, formally founded in 1872, incorporated as a village in 1861, and chartered as a city in 1898. From the 1830's to the 1890's it was important as a lumbering center. Government is by mayor and council. Pop. (1940) 32,332; (1950) 48,429.

MUSKOGI INDIANS. See **CREEKS**.

MUSKOKA, müs-kō'kà, district, Canada; in Ontario, bordering Georgian Bay; the name also being borne by a beautiful lake and river, and comprehensively applied to the extensive region, 4,000 square miles in extent, lying between Georgian Bay on the west, Lake Nipissing on the north, Ottawa River on the east and Lake Simcoe on the south. The capital of the district is Bracebridge, on the Canadian National Railway. The region is a paradise for sportsmen, with between 800 and 1,000 lakes and smaller bodies of water, chief of which are Muskoka, Rosseau and Joseph lakes, all abounding in fish and studded with beautiful islands; several rivers and picturesque waterfalls, notably High Falls and South Falls on the Muskoka River and Bridal Veil Falls on the Shadow River; and extensive forests filled with game. It is one of the most popular summer resorts in Canada, and is visited annually by thousands of people. During the summer, steamboats ply on the principal lakes, connecting with the Canadian National Railway and the Canadian Pacific Railway. Area of Muskoka District: 1,585 square miles.

MUSKRAT, an aquatic rodent (*Ondatra zibethicus* or *Fiber zibethicus*) numerous throughout North America, and yielding a valuable fur. It is a member of the rat family (Muridae), and is, in effect, a gigantic vole or meadow-mouse, with a tail flattened sideways into a powerful swimming instrument, and fringed with stiff hairs. The hind feet are set obliquely to the leg; the ears are very small and buried in fur; the muzzle is blunt and furry; the palms and soles are naked and fringed with hairs. The average total length is about 21 inches, of which the tail is more than a third, measuring as long as the body without the head. The color varies above from almost black to pale brown; sides of head and body, chestnut-brown; under fur, bluish gray; feet, dark brown; tail, black. Those of the Rocky Mountain region are smaller and paler than Eastern ones. The musky odor of these animals is due to a thick fluid secreted in two small glands near the generative organs, which imparts a taint to the flesh that makes it unpalatable to most persons.

These animals live along small streams, and in swampy places generally; being most abundant around Chesapeake Bay and in the marshy lakes of the upper Mississippi region and northward to Hudson Bay. Where the banks have some elevation they form extensive burrows, which have entrances below the surface of the water, and gradually ascend till they terminate in a chamber above the level of high water. These burrows are most frequently made under the roots of trees, or in other situations of difficult access. The excavations are of great injury to artificial embankments along canals and rivers, by permitting the water to undermine and to make large breaches in them, and in some parts of the country they do serious damage to canal embankments and river-dikes. When, however, these animals inhabit low and marshy situations, they construct conical houses usually surrounded by water, not unlike those of the beaver but smaller, composed of reeds, etc., mixed with clay. These houses have subterranean passages leading to them, and are inhabited by many individuals during the winter; but in the warm weather they desert them entirely, and dwell in pairs in

a bank burrow while they rear their young. The houses contain a large, smooth-walled chamber, above the water line, and when frozen are sufficiently solid to form a protection against all but the largest carnivora; but they are usually destroyed and swept away in the spring floods, so that a new house is erected every season.

The muskrat feeds mainly upon aquatic vegetation, especially the rootstocks and basal parts of stems, and is especially fond of pond lilies. These it brings to the shore to eat, almost always during the night, for it is essentially nocturnal, although often seen abroad in the daytime. It is very fond of mussels, and brings great quantities of these ashore, always, when possible, at the same place, so that piles of their shells accumulate to indicate favorite feeding spots. In summer the muskrats feed on shore herbage somewhat, and frequently go some distance to get a meal of growing corn, garden vegetables, or fallen fruit. They are accused also of occasional fish-catching, and are unwelcome in waters devoted to fish culture. Because of the commercial value of its fur and its destructiveness in some places, the muskrat is incessantly persecuted by man. It is also preyed upon by many natural enemies—minks, wolverines, foxes, wildcats, badgers, wolves, birds of prey, water moccasins, snapping turtles, pike, and others, which capture many young and some adults. Nevertheless muskrats are so secretive and so prolific, and have found so many advantages in civilized areas, that they are likely to maintain their numbers indefinitely. They produce from three to 12 young at a birth, and often breed three to five times a year.

Muskrats are taken by shooting, spearing in winter (through their houses or through the ice), or, most numerously, by trapping. In certain districts, as along Chesapeake Bay, men make a regular business of trapping muskrats in winter.

Consult Hodgson, Robert G., *Successful Muskrat Farming*, 6th ed. (Toronto 1930); Elliman, J. R., *Families and Genera of Living Rodents*, 2 vols. (London 1940-41).

MUSLIM or MOSLEM. See ISLAM; MOSLEM SECTS.

MUSLIN, mŭz'lin, a name used for various fabrics of cotton or silk, of different degrees of fineness. The word is derived from the city of Mosul on the Tigris River, now in Iraq, where the cloth is thought to have been originally made. Marco Polo describes muslins of silk and gold which he saw at Mosul in the late 13th century. The finest cottons so named, however, came in ancient times from India, especially Madras and Dacca, whose fabrics were spoken of as "woven air and running water" because of their fineness; they were not infrequently adorned with gold. Modern muslins range from fine crisp fabrics, often dotted or figured, used for women's clothes, to coarser materials used for bed linens. Silk muslins, often called by the French name *mousselines*, are also still produced.

MUSORGSKI or MOUSSORGSKY, mŭs'ōr-g'skŭ-i, **Modest Petrovich**, Russian composer: b. Karevo, Pskov Government, Russia, March 21, 1839; d. St. Petersburg, March 28, 1881. The composer's father was a wealthy landowner, his paternal grandmother a peasant. Even as a small child he showed a tendency to compose spontaneously, inspired by the fairy tales he heard from his nurse. His mother began his

musical education early, and he gave his first piano recital before an audience of family and friends at nine. Later he had formal instruction, but there always remained something amateurish and self-taught in his technique. At 13 he was sent to the Cadet School in St. Petersburg, where he took an interest in history while, on the musical side, the choirmaster urged him to study church music. As an officer in St. Petersburg (1856-1858), he became acquainted with Mili A. Balakirev, Aleksandr P. Borodin, César A. Cui, and Nikolai A. Rimski-Korsakov, who, together with Musorgski, later became known as the Mighty Five, founders of a new school of realistic national music in Russia. Musorgski quit the army in 1858, but financial losses resulting from the freeing of the serfs in 1861 forced him to become a civil servant. From 1858 he suffered from nervous ailments and alcoholism.

His songs, choral and piano music had already won him a reputation when, in 1868, he began to compose *Boris Godunov*, the libretto based on Aleksander Pushkin's historical play. The opera is suffused with Musorgski's feeling for the Russian past, his popular sympathies, and his ability to hit off character sharply with sparse and simple musical touches. Dramatic power saves *Boris* from being a sprawling panorama, which was a danger in view of its scope and relative plotlessness. Though the producers had twice rejected it, this masterwork was warmly received at its world premiere in the Maryinsky Theatre in St. Petersburg, Feb. 8, 1874. Musorgski was already working on his second major opera, *Khovanschina*, basing it on the turbulent beginnings of Peter the Great's reign; but he never completed it, and after 1874, the year of his piano suite *Pictures from an Exhibition*, his powers declined as his health failed. After Musorgski's death, Rimski-Korsakov finished *Khovanschina*, and also edited Musorgski's other works with such a free hand that for many years much music known as Musorgski's was in essentials Rimski's. Objections by critics and public finally forced restoration of the scores as originally composed, and in 1928 the Soviet government began to print a monumental edition of the original texts. MUSSELBURGH, mŭs'l-bŭ-rŭ, burgh and seaport, Scotland, in Midlothian, on the Firth of Forth, six miles east of Edinburgh, of which it is gradually becoming a suburb. The river Esk divides it into Musselburgh proper and Fisherrow, the port. It has noted golf links, and a curious old jail built in 1590 of stones from the shrine and chapel of Loretto. Prince Charles Edward, the Young Pretender, slept in Pinkie House, a Jacobean mansion, the night after the Battle of Prestonpans (1745). Loretto School, one of Scotland's best public schools, is in Musselburgh. Industries include papermaking, brewing, and the manufacture of twine products. Coal is mined in the vicinity and there are a number of market gardens. There is a large fishing population located in Fisherrow. Pop. (1951) 17,012.

MUSSELS, mŭs'lz, a term generally applied to most of the fresh-water bivalves in the families

Unionidae, Margaritanidae, and Mutelidae, and to a limited number of marine bivalves, most of these latter being in the family Mytilidae.

Fresh-water Forms.—The family Unionidae is widespread in Central and North America, Europe, and Asia. The Margaritanidae, limited to North America, Europe, and Asia, comprises very few species. They are similar in their habits to the Unionidae, differing only in minor anatomical details. The Mutelidae are distributed mainly in South America, Africa, and Australia. Nearly all of the Unionidae are parasitic on fish during their early larval stages. After fertilization the young are held in the gills where additional growth takes place. Upon developing a small bivalve shell, usually with two tiny hooks on the ventral margin, they are ready to be extruded. At this stage they are known as glochidia. A violent contraction of the two valves of the female mussel ruptures the glochidial membrane, and the young glochidia are expelled through the exhalant siphon. The few that may directly contact a fish host fasten themselves to the gills or fins. Here they become encysted for shorter or longer periods of time, depending entirely upon the fluids of their host for sustenance. Upon the maturity of this second larval stage, the encystment sloughs away, and the still minute mussel leaves its host and begins its own existence on the stream or lake bottom. There is considerable variation in the duration of the parasitic stage and in the selection of the fish host among the many species of fresh-water clams. In general, the most widely distributed species of mussels have a wide selection of fish hosts.

In North America their greatest development has occurred in the Ohio River system and in the Alabama-Coosa river system. Shells of these mussels were in considerable demand for making pearl buttons, but the development of plastics has lessened this demand somewhat. Primitive man used these various mussels for food, as attested by the numerous shell heaps which are found along many river margins where these animals were abundant. Pearls of considerable value have been found in certain species of mussels but their occurrence is rare, at least as smooth, rounded pearls of commercial value.

Marine Mussels.—Most of the marine species that are called "mussels" belong to a single family, Mytilidae. They occur in nearly all temperate and tropical seas of the world. They frequent the intertidal zone, clinging to rocks, other shells, wharf structures, and even to each other. The valves are generally elongate, pointed at one end and smoothly rounded at the other. In Europe they are an important food item, but are much less so in New England where they are equally abundant. Their minor value as an item of food is offset by the damage they do as fouling organisms, clinging to the bottom of ships, buoys, intake tunnels, and many other marine structures. This necessitates frequent cleaning and scraping of such structures, and adds enormously to maintenance costs. See also BIVALVES; MOLLUSCA.

WILLIAM J. CLENCH.

MUSSET, mü-së' (Louis Charles) Alfred de, French poet and playwright: b. Paris, France, Dec. 11, 1810; d. there, May 2, 1857. He was born into cultured, comfortable circumstances, and educated at the Collège Henri IV, where his first compositions won high praise. He hesitated at first among several professions, but by his

20th year, when he published the volume of verse entitled *Contes d'Espagne et d'Italie*, he had definitely chosen letters. For the next few years Musset's poems and plays showed the influence of Lord Byron, especially in their satirical quality and sense of doom. His start in the theater, with *La nuit vénitienne* (1830), was not happy.

The winter of 1833-1834 marked the crisis of Musset's life—his connection with George Sand (q.v.), and their Italian journey. With little real sympathy save a joint consciousness of genius, the two could not hope for enduring happiness; but the affair precluded two years (1834-1836) of intense literary creation by Musset. During these years he wrote the *Nuits* (see NUIT DE MAI) and various other love poems, which have won him the title of the greatest French love poet. *Stances à la Malibran* was also composed at this time. For the theater he wrote, among other pieces, *On ne badine pas avec l'amour* (1834, q.v.), *Lorenzaccio* (1834), and *Il ne faut jurer de rien* (1836). It is a tribute to his dramatic power that although many of his plays were not intended for production, he is perhaps the only playwright among the romantics who holds the stage today. In prose he wrote *La confession d'un enfant du siècle* (1836, q.v.), an account of his life with Sand, which is also a political testament and the evocation of an era. Shortly thereafter he broke with romanticism in the *Lettres de Dupuis et de Cotonet* (1836-1837).

After 1840 Musset's creativity began to decline, a not illogical development in view of his precocious beginning, his pessimism, and dissipation; but he did publish the patriotic song *Le Rhin allemand*, an answer to Nikolaus Becker's *Rheinlied*; and the popular comedy, *Il faut qu'une porte soit ouverte ou fermée* (1845). Over conservative opposition he was elected to the French Academy in 1852. His collected works were published in France (1933-1938).

Consult Musset, Paul de, *Biographie d'Alfred de Musset* (Paris 1877); Sedgwick, Henry D., *Alfred de Musset* (Indianapolis 1931).

MUSSOLINI, mōōs-sō-lē-nē, Benito, Italian premier and dictator: b. Dovia di Predappio, Forlì Province, Italy, July 29, 1883; d. Dongo, Como Province, April 28, 1945. Mussolini's father Alessandro was a blacksmith with socialist leanings, who named his son for the Mexican liberator Benito Juárez. At great sacrifice, the family procured Benito an education, first at parochial school and then at a normal school; at various times he was an elementary school teacher. The chief events of Mussolini's early life were his sojourn in Switzerland, where he went in 1902 and became associated with a group of revolutionaries, finally being expelled from the country for his activities; his stay in the Austrian Trentino in 1908-1909, which aroused his nationalistic feelings; and his reading of Friedrich Wilhelm Nietzsche and Georges Sorel, philosophers of force. By the outbreak of World War I in 1914, Mussolini was Forlì's leading Socialist and the trenchant editor of the party's official newspaper *Avanti!*

After hesitating for some weeks, Mussolini espoused the Allied cause in the war, perhaps motivated by French bribes. The Italian Socialists as a group remained pacifist, and Mussolini was forced from the party and his editorship (Oct. 20, 1914). On November 14 of that year, he founded his own *Il Popolo d'Italia* in Milan.

justifying Italian entry into the war by saying it would promote the proletarian cause throughout Europe. He himself was drafted as a private and severely wounded in a training accident (Feb. 23, 1917), eventually returning to his newspaper. By this time his break with socialism was complete.

Rise to Power.—Postwar conditions suited Mussolini's policy of cynical opportunism. To gain backing, he played on fears of the sizable Communist movement, and appealed to the growing patriotic discontent with Italy's share in the postwar settlement. On March 23, 1919 in Milan, he founded the first of the *Fasci di combattimento*, a political grouping whose program mixed syndicalist and nationalist catchwords. He backed Gabriele D'Annunzio's seizure of Fiume, which in its illegality and use of bluff was typical of his own future foreign policy. Mussolini used his hands of blackshirted *squadristi* against strikers, Communists, and Socialists in the turbulent years 1919-1922, as Fascist affiliates continued to spring up in northern Italy. His claim to be Italy's savior from communism was born in these years, but cannot be accepted; by 1920 the Communist threat had receded.

In the 1921 elections, 22 Fascists were returned to Parliament, and the party was organized nationally, Mussolini being known as *Il Duce*, the leader, a title later copied by Hitler and others. In 1922 a prolonged general strike was broken by the *squadristi*, clearing the way for the carefully planned march on Rome (Oct. 28, 1922). During this crisis Mussolini himself stayed in Milan, until the vacillating King Victor Emmanuel III, ignoring the advisers who would have arrested Mussolini, called upon him to form a cabinet (October 31).

Dictatorship.—Once in power, Mussolini moved step by step to establish a dictatorial regime. A new electoral law, adopted in 1923, guaranteed the Fascist Party a two-thirds majority in Parliament; five years later elections were reduced to the registration of a yes or no vote on a list of candidates prepared by the Fascist Grand Council, whose members were appointed by Mussolini. Finally, in 1938, the Chamber of Deputies was abolished in favor of a Chamber of Fasci and Corporations, with an entirely appointive membership. To insure his personal rule further, the dictator always reserved several cabinet portfolios for himself. Any attempt to oppose the regime was smashed by the secret police and the armed Fascist militia.

Encouraged by the apparent weakness of the democratic powers during the years of economic depression, Mussolini embarked on an aggressive foreign program, beginning with the invasion of Ethiopia (October 1935). When the League of Nations imposed sanctions, he defied the world organization, and finally in December 1937 withdrew Italy from membership. In the summer of 1936, in cooperation with the German dictator Adolf Hitler, he intervened openly in the Spanish Civil War on the side of Gen. Francisco Franco, sending tens of thousands of Italian troops and large numbers of planes to fight in Spain during the next three years. In October 1936 the Rome-Berlin Axis was formed by a secret agreement, which became an open military alliance in May 1939. In April of the latter year Italy annexed Albania.

Downfall.—Expecting to score an easy victory after Hitler's initial successes, Mussolini led

Italy into World War II in June 1940. But repeated defeats in the field and the threatened invasion of Italy by the Allies led to his downfall only three years later. He was turned out by the Fascist Grand Council itself on July 25, 1943, and taken into custody, from which he was freed by German paratroopers on September 12. Carried off to northern Italy, which was under German occupation, he headed a puppet regime there until the final German collapse. He attempted to flee Italy in disguise, but was seized by partisans on his way to Switzerland, and shot with his mistress, Clara Petacci. His body, defiled by the Milanese populace, was later sequestered by the Italian government, which feared that his grave might become a shrine for the Fascist remnant.

By marriage to Rachele Guidi, Mussolini had five children, of whom his favorite was the eldest daughter, Edda, wife of Count Galeazzo Ciano (q.v.). Besides his extensive political writings and speeches, he was the author of a book on John Huss (1913; Eng. tr., 1929); a novel (Eng. tr., *The Cardinal's Mistress*, 1928); a play, with Giovacchino Forzano (Eng. tr., *Napoleon: the Hundred Days*, 1932); and two volumes of autobiography (Eng. tr., *My Autobiography*, 1928, 1939; *The Fall of Mussolini*, 1948). See also FASCISM; ITALY-3. *History* (Modern Italy): The Rise and Fall of Fascism.

MUSTAFA KEMAL. See KEMAL ATATURK.

MUSTANG. See HORSE—*Modern Breeds*.

MUSTARD, müs'têrd, any of about 100 plants of the genus *Brassica* (family Brassicaceae, q.v.) with yellow flowers and linear or oblong pods. Several species are grown for their seeds, especially *B. alba* and *B. nigra*.

MUSTARD GAS. See CHEMICAL WARFARE.

MUSTARD OIL. See OIL OF MUSTARD.

MUSTELIDAE, müs-têl'i-dê, a family of carnivorous mammals related to the dogs, bears, and raccoons and traceable to early Oligocene times. A special characteristic of the family is the presence of only one molar tooth on each side of the upper jaw. In general, the dentition resembles that of the cats. The family includes five subfamilies: weasels (*Mustelinae*), skunks (*Mephitinae*), badgers (*Melinae*), ratsels (*Mellivorinae*), and otters (*Lutrinae*), thus including the ermine, stoat, mink, ferret, polecat, marten, sable, fisher, and wolverine. The habitat is worldwide outside Australasia and Madagascar, but it is in the subarctic and temperate regions of the Northern Hemisphere that the *Mustelidae* are numerous and produce the most valuable fur.

MUT, mōōt, in Egyptian religion, one of the chief goddesses, wife of Ammon (Amon, Amen), and mother of Khonsu; especially worshiped at Thebes. Her name signifies "mother."

MUTANABBI, al-, ăl-mōō-tā-nāb'bī (real name ABU-AL-ṬAYYIB AḤMAD IBN-ḤUSAYN), Arabian poet: b. Al Kufa (now in Iraq), 915; d. near Baghdad, 965. The sobriquet al-Mutanabbi, meaning "prophecy claimant," was conferred upon him in his youth. His most important work, *Diwān*, comprising 289 poems, shows

great talent and national spirit besides richness of language, but there are defects of exaggeration in poor taste and certain flattery that is lowering to the general dignity of the verses. Dieterici edited the work, together with the 'Commentary' of Wahidi, who died 1075, under the title 'Mutanabbii carmina' (Berlin 1861); and that of 'Ukbari, who died 1219, was published at Calcutta, Cairo and Bulak with other 'Commentaries.' Hammer-Purgstall translated (poorly) the 'Diwan' (Vienna 1824). Consult Bohlen, 'De Motenabbio' (Bonn 1824); Dieterici, 'Mutanabbi und Seifuddaula' (Leipzig 1847).

MUTATION THEORY, a hypothesis of organic evolution which accounts for development by sudden changes or "leaps" rather than by slow and successive degrees; sometimes styled saltatorial evolution. It is illustrated by "Sports" (q.v.),—sudden aberrations from the normal, more familiar in botany than in zoology, but often occurring there. This mode of evolution has always been regarded as effective to some degree, but its general application was urged by Prof. Hugo De Vries, of Amsterdam, in his work 'Die Mutations-theorie,' published in 1901. Professor De Vries showed that the objections urged against the Darwinian theory on the ground of the prodigious length of time needed for the development of species could be explained away by a due regard to the phenomena of mutation. He showed that new species are produced in this way not only on a single occasion, or with single individuals, but repeated continually and in large numbers. In the field of botany to which Professor De Vries' investigations were confined, he established the fact that mutations take place in the seed, independently of the vicissitudes of growth in the field, and in accordance with certain apparent laws. The new species which results from mutation remains constant but exhibits a tendency to throw off an ever increasing series of variations. Consult De Vries, H., 'Species and Varieties' (Chicago 1906); Lock, R. H., 'Recent Progress in the Study of Variation.'

MUTHER, moo'tér, Richard, German art historian: b. Ohrdruf, Germany, 25 Feb. 1860; d. 1909. He was educated in the University of Heidelberg and the conservatory of Munich and devoted his attention to the history of art in which subject he was professor at the University of Breslau since 1895. He has published 'Anton Graff' (1881); 'Meisterholzschnitte aus den Jahrhunderten' (1887); 'Geschichte der Malerei des 19ten Jahrhunderts' (1893; Eng. trans., 'History of Modern Painting,' 4 vols., 1907); 'Geschichte der Malerei' (5 vols., 1899-1902; Eng. trans. by George Kriehn, 2 vols., 1907).

MUTINY (Fr. *mutin*, refractory, stubborn *mutiner*, to rise in arms). Two hundred years ago the word mutiny was often used in describing insurrection or sedition in civil society; but it is now applied exclusively to certain offenses by sailors and soldiers. Properly it is the act of numbers in resistance of authority; but by statutes, certain acts of individuals are declared to be mutiny. The act of Congress of 3 March 1835 defines mutiny or revolt in the following language:

If any one or more of the crew of any American ship or vessel on the high seas, or on any other waters within the maritime and admiralty jurisdiction of the United States, shall unlawfully, wilfully, and with force or by fraud, threats, or other intimidations, usurp the command of such ship or vessel from the master or other lawful commanding officer thereof; or deprive him of his authority and command on board thereof; or resist or prevent him in the free and lawful exercise thereof; or transfer such authority and command to any other person not legally entitled thereto; every such person so offending, his aiders and abettors, shall be deemed guilty of a revolt or mutiny and felony.

The same statute provides for endeavors and conspiracies to excite mutiny. In construction of the act it has been held that mere disobedience of orders by one or two of the seamen, without any attempt to excite a general resistance or disobedience, and insolent conduct or language toward the master or violence to his person, if unaccompanied by other acts showing an intention to subvert his authority as master, are not sufficient to constitute the offense of endeavoring to excite mutiny. An indictment for this crime, it is said, must set forth a confederacy of at least two of the men to refuse to do further duty, and to resist the lawful commands of the officers. The offense of making a revolt was by the act of April, 1790, punishable by death. By the act of 1835, it is punished by fine not exceeding \$2,000, and by imprisonment and confinement at hard labor for not more than 10 years, according to the nature and aggravation of the offense; while attempts to excite a mutiny are punishable by fine not exceeding \$1,000, or by imprisonment not exceeding five years, or by both. Mutinous conduct in the army and navy is provided for by the acts of 10 April 1806 and of 23 April 1800. By the former, "any officer or soldier who shall begin, excite, cause or join in any mutiny or sedition, in any troop or company in the service of the United States, or in any party, post, detachment, or guard, shall suffer death, or such other punishment as by a court martial shall be inflicted." Under the latter, "if any person in the navy shall make, or attempt to make any mutinous assembly, he shall, on conviction thereof by a court martial, suffer death." These laws are embodied in the present articles of war and articles for the government of the navy, except that death is not now mandatory in the navy. The law of mutiny in Great Britain is in general similar to the United States statute, except that the penalty of death is not imposed.

MUTOSCOPE, a mechanical apparatus for exhibiting instantaneous pictures of moving objects taken by the kinetograph or similar instrument. Photographic prints from the series of pictures thus obtained are mounted in consecutive order around a cylinder standing out like the leaves of a book. When this cylinder is slowly revolved, the picture cards being held back by a stop, and allowed to snap past the eye one by one, as one thumbs the leaves of a book, an apparently moving picture is the result. See CINEMATOGRAPH; MOVING PICTURES

MUTSU, müt'sù or müt's', Munimitsu. COUNT, Japanese statesman: b. Wakayama, 1842; d. Tokio, 24 Aug. 1897. After six years' foreign services and as governor of the province Kanagawa he was appointed (1874) secretary of the senate. He suffered a long imprisonment, from 1878, for participation in the Saigo Rebellion, but was pardoned in 1882 and

was again employed in foreign affairs by the state. From 1888-90 he was Ambassador to the United States, then becoming Minister of Agriculture in the Japanese Cabinet. During the Ministry of Marquis Ito (1892-96) he was Minister of Foreign Affairs, being a member of the peace plenipotentiary party that arranged the treaty with Li Hung Chang at Shimonaseki, for which he was rewarded (1895) with the title of count. In 1894 he negotiated a treaty with Great Britain in which the latter renounced extra-territorial jurisdiction from July 1899. Lung troubles enforced his retirement from political activity in 1896.

MUTSUHITO, moo-tsu-hee-to, the 121st in the line of mikados or emperors of Japan and, according to the impersonality ruling in all Japanese history, posthumously called after the year-period, the Meiji Tenno: b. Kyoto, 3 Nov 1852, 2d son of the Emperor Komei; d. 1912; declared heir-apparent 10 July 1860; succeeded to the throne January 1867; inaugurated as sovereign, with the three imperial symbols, mirror, jewel and sword, 31 Oct. 1868; married 28 Dec. 1868 to Haruko, then 19, and the 3d daughter of the noble of the 1st rank Ichijo. No children were born of this union, but of the issue from imperial concubines, four sons and four daughters survive. From the first, brought up amid sounds of battle and in sight of the war fires of contending clansmen in Kyoto, as the old and new forces struggled for mastery, and, happily, early surrounded by men of vision and liberal minds, some of whom had been in Occidental countries, Mutsuhito was from the first in hearty and active sympathy with modern progress and civilization. One of his first public acts was to take the famous charter oath of five principles. In one of these he promised a national deliberative assembly, and in the other to seek for talent throughout the world for assistance in relaying the foundations of his empire. He became a shrewd judge of men and motives and a lover of peace. He signed in autograph the treaties, entered warmly into measures of reform and in erecting memorials to the martyrs and those who had advocated mikadoism and unity of government, traveled all over the empire to see his people, paid unique honors to his wife in public and private, and was a laborious servant of the nation. By personal tastes and habits thoroughly Japanese to the end of his days, he was a cosmopolitan in mind and sympathies, and his character as well as his office turned the scale in great crises, when grave debate was held by rival statesmen in his presence. Every word of the text of the constitution of 1889 was, during the two years of deliberation, discussed before him. Most notable and fiercely debated was the guarantee of religious liberty. His reign was marked by many wonderful events and a most extraordinary outburst of intellectual, industrial and military energy. On the 25th anniversary of his marriage, memorial postage stamps were issued and the empress was notably honored, marking a new era in the history of Japanese womanhood. The days of his last illness saw a prayer-meeting that was national and without regard to creed or class, all gods being petitioned, and the general sorrow was sincere and profound. His mausoleum in Kyoto cost over \$1,000,000. His con-

sort, a true helpmeet and of finest character, followed him in death 8 April 1914. Both sovereigns were notable poets. From about 1870 the Japanese ceased to use the ancient poetical term mikado and adopted the native term tenshi, or tenno (son of heaven, or heavenly king), or emperor, as best according with the new status of Japan as a world-power. Consult Griffis, 'The Mikado's Empire' (1909), and 'The Mikado: Institution and Person' (1915); and Mrs. Fraser's 'Letters from Japan' (1899).

MUTTON-BIRD, a sailors' name for the shearwater (q.v.).

MUTTRA, is the northwestern district of the Agra Division, United Provinces, lying between lat 27° 14' and 27° 58' N., and long. 77° 17' and 78° 13' E., with an area of 1,445 square miles. It lies on both sides of the Jumna and in the centre of the western border; the Arvallis Mountains extend in the form of a low range of hills. There are no rivers besides the Jumna, but there are canals, wells and marshes. The climate is hot and dry, with extremes of temperature. There is very slight rainfall. Muttra contains 14 towns and 837 villages. The population has been frequently devastated by famine, but better road facilities and irrigation have lessened these difficulties. About 90 per cent of the people are Hindus and less than 10 per cent are Mussulmans. The principal crops are millets, pulse, cotton, wheat, barley and sugar cane. The administration is under a member of the Indian Civil Service and three deputy collectors. According to Ptolemy, Muttra was the capital of the ancient kingdom of Surasena and was an important religious centre, as the many antiquities discovered here testify. It was sacked by the Mahmud of Ghazni in 1019, but played only a slight political part. It was revived during the Buddhist period as a centre of faith. Its history was merged into that of the Jats of Bharatpur, and after changing hands several times came under British dominion in 1803. In 1857 it mutinied but was put down in the same year and has since remained friendly.

MUYSKAS, mü-é'skä. See CHIBCHAS.

MUZAFFAR-ED-DIN, moo-zä-fér'ed-dén', Shah of Persia: b. Teheran, 25 March 1853; d. there, 9 Jan. 1907. He was governor of Azerbaijan; succeeded his father, Nasr-ed-Din (q.v.), 1 May 1896. Influenced by European civilization, he showed great tolerance toward the Christians, and did much to reform the internal administration of Persia by lightening taxes and by establishing a parliamentary government. He visited Europe several times.

MUZAKOVA, mü-zhã-kô'vá, Johana. See SVETLA KAROLINA.

MUZIANO, moot-së-ä'nò, Girolamo, commonly known as BRESSANO, Italian painter: b. Aquafredda, near Brescia, 1528; d. Rome. 27 April 1592. He was a pupil of Romanino (see ROMANINO GIROLAMO) and of Titian at Venice, and subsequently imitated Michelangelo. He was a skilled mannerist who could paint in

any style while possessing none of his own. The Academy of Saint Luke was founded at his instigation. Among his most successful pictures are 'The Taking Down from the Cross,' in the Borghese Gallery, Rome; 'The Gift of the Apostolic Keys,' in the Vatican. There are also some frescoes of his still to be seen in the Vatican.

MY PRISONS ('LE MIE PRIGIONI'), one of Italy's most noted books, was written by Silvio Pellico (1789-1854) and published in Turin in 1832. The work is autobiographical, relating the 10 years' experience of the author, charged with conspiracy and condemned by the Austrian government, first to death and subsequently to 15 years of imprisonment in the prisons of Venice and Spielberg, near Brünn in Austria. The work itself is of the simplest character, written, as he says in his preface, to comfort unfortunates like himself by showing that under the most unfavorable conditions humanity is not as black as it is painted. Had Pellico aimed directly to expose the inhumanity and cruelty of the Austrian government, as might have been expected he would have done, his effort would likely have fallen far short of what he actually accomplished in doing just that in this pathetic tale of his sufferings borne with the utmost Christian resignation. No hatred nor vindictiveness toward his arrogant persecutors escapes the unfortunate victim. In fact it is just here that the recital is most open to criticism. The patient sufferer is too submissive, too long-suffering. Inoffensive and saintly as he is, that virility, which, because founded on righteousness, must ever command respect, is conspicuously lacking in him. His sad story awakened throughout Italy the most profound sympathy. Its moral effect may be compared to Chateaubriand's 'Genie du christianisme,' which was worth an army to Napoleon. Pellico's 'Le mie prigioni' was, as Cesare Balbo, who counseled the author to write the story, has said, worse for Austria than losing a battle. It is not primarily as an author that Pellico's place is secure in the hearts of his countrymen, for his literary work as a whole is rather commonplace, but as a Christian martyr upon whom an odious enemy has placed a crown of thorns. From the time of the appearance of this story, the hateful domination of Austria was judged and condemned by the fairminded not only of Italy but of Europe. Nothing has ever been written better adapted to cause and to perpetuate feelings of hatred toward a despicable tyrant. And even to-day the influence of 'Le mie prigioni' on Italian sentiment toward Austria is abiding. Many translations of 'Le mie prigioni' have appeared in many languages and English versions are easily procurable in the large libraries.

JAMES GEDDES, JR.

MYCALE, mīk'a-lē, Asia Minor, the classical name of the modern Samsun, a mountain of south Ionia, with the promontory of Cape Santa Maria opposite the island of Samos as its seaward termination.

MYCENÆ, mī-sē'nē, Greece, an ancient city of Argolis in the Peloponnesus, six miles northeast of Argos, built on a steep hill dominating the passes to Corinth. Its ruins since Schliemann's excavations in 1876 have yielded

an abundance of archæological treasure of the greatest value and interest, illustrating the distinctive Mycenaean period of civilization, which preceded the culminating era of Hellenic culture. Mycenæ is said to have been founded by Perseus, and before the commencement of the Trojan War was the residence of Agamemnon, in whose reign it was regarded as the leading city in Greece; it was also the scene of the domestic tragedies of the house of Atreus (q.v.). It declined in importance after the invasion of the Dorians, but its cyclopean walls, citadel and other features, chief of which are the Lion's Gate, and the vaulted building of megalithic architecture called the Treasury of Atreus (q.v.), stood through succeeding centuries, and still stand, as monuments of its ancient grandeur and importance. (Consult Schuchhardt-Sellers, 'Schliemann's Excavations' (1891); Hall, 'The Oldest Civilization in Greece' (1901); Tsountas and Manatt, 'The Mycenaean Age' (1897).)

MYCORRIZA is a general name for a group of subterranean fungi that spread their growing, feeding part (mycelium) through the loose damp soil (humus) of the floor of a forest or wood-lot. They are symbiotic with a great variety and number of green-leaved plants, including forest trees of several families. The first root of one of these affected plants, just born from the seed, remains free, but as fast as the lateral roots push out they are enveloped in the mycelium of the fungus, and their ramifications become entangled in it as they spread, and this connection continues throughout life. Wherever a root or rootlet extends underground the fungus accompanies it. The mycelial filaments may form a dark-brown, felt-like coating over the whole surface of the root, or, in other cases, depending on the species, may make a net-work of spider-web-like mesh. At various points the spore-producing hyphae proceed outward through the soil from the mycelium; they look like rootlets and seem to perform a similar service. This mycelium (called "spawn" by mushroom growers) represents an unknown number and variety of species of fungus, and it abounds in the humus of forests and uncultivated heaths where the top-soil is the result of vegetable decay. The coating of roots by this mycelium is to be seen wherever plants grow, but it does not affect every kind of plant. It is restricted to the flowering plants, among them all the *Pyrolaceae*, *Vaccineae* (whortleberries), and *Arbutae*, and most if not all the heath family (*Ericaceae*), rhododendrons, daphnoids, a great number of conifers and all the *Cupuliferae* — a group that includes the oak, beech, alder, chestnut and many other forest trees; also many isolated trees, as willows and poplars, and the genista and several other familiar garden herbs.

This association of the mycorrhiza with the flowering plants is in each case a partnership of mutual benefit. Covering the root with a mantle it prevents, it is true, the absorbent pores from performing their function of withdrawing from the soil the dissolved elements that constitute the food of the plant, but in compensation the fungus takes on itself this function, absorbing the required nutriment and delivering it to the plant. It is enabled to do

this because the mycelium has the power of secreting "those special enzymes, or ferments which render soluble the organic ingredients they touch." In return for this service it receives from the plant-root nourishment for itself, which has been elaborated in the leaves and distributed to every part of the plant, including its uttermost rootlet. This, indeed, is only following the custom of all fungi, which, having no chlorophyll with which to derive nourishment from the air through chemical dissolution and recombination, must get it from vegetable sources. This association of the mycorrhiza with plant-roots is therefore really a parasitism, yet it seems not only harmless but decidedly beneficial—in fact, those plants participating in this association will not do well, and perhaps will fail to grow at all, in a soil wholly free from suitable mycorrhiza. Hence the special value of the addition of wood-mold to garden or window-pot soil is that it brings with it this advantageous, and sometimes indispensable, mycorrhiza mycelium.

ERNEST INGERSOLL.

MYDDELTON, or MIDDLETON, SIR Hugh, British contractor: b. Galch Hill, Denbigh, Wales, about 1560; d. 10 Dec. 1631. He was by trade a goldsmith, banker and cloth-maker of London, but became (1597) an alderman of Denbigh, then was elected member of Parliament for that town in the years 1603, 1614, 1620, 1623, 1625 and 1628. The lack of water supply for the rapidly growing city of London induced the Parliament to pass a bill for the construction of the "New River" to tap the springs in Hertfordshire, and he contracted to carry out the undertaking. Powerful opposition from the landed proprietors forced him to call in the king's aid and James I paid half the cost in return for half the profits. The canal, begun 1609, was completed in 1613 and was then 38 miles long, 20 feet wide, with a depth of but four feet. Until after his death the project was unprofitable and he lost considerably though the New River Company later became, after his death, one of the most profitable undertakings of centuries, its shares (known as "King's" and "Adventurers") being broken up in 30-second parts, bring immense dividends to this day. In 1617 he made considerable profit in the exploitation of lead and silver mines in Cardiganshire. He was created a baronet in 1622.

MYELITIS (from Greek *μυελός*; marrow), an inflammation, attended with more or less softening, of the substance of the spinal cord. It may be acute or chronic and is a rare disease. Some of the maladies formerly ascribed to chronic myelitis are now known to be due to chronic induration and thickening (sclerosis). The most common causes of myelitis are: irritation of the cord by fractured, dislocated or diseased vertebrae, by the pressure of a tumor, or by hemorrhage into its substance. The disease is aggravated by intemperate habits. It begins usually with pain or other uncomfortable sensations in the spine or extremities, and fatigue, followed by an uncertain gait, paralysis and very frequently death. There are four different forms of the disease according to the position of the inflammation, which may be in the midthoracic region, the most common form, or in the lumbar or lum-

bosacral region, in the cervical region or it may, instead of affecting only a certain definite locality such as those already mentioned, involve a number of small areas in the whole length of the cord and brain. This form is called disseminated myelitis. If the inflammation involves the upper part of the cord above the origin of the respiratory nerves, respiration is interfered with and death results from asphyxia. This is, however, exceedingly rare. If the inflammation exists lower down, in addition to the loss of motor power in the extremities the bladder and rectum may be paralyzed, the evacuations are discharged involuntarily and death occurs from exhaustion. The tendency of the inflammation is to spread. Treatment consists of salvarsan and mercury for the cases of syphilitic origin. Absolute rest in bed must be required, an air or water bed being preferable as bed sores are very likely to occur.

MYERS, Abraham C., American Confederate soldier: b. in South Carolina, 1811; d. Washington, D. C., 20 June 1889. When a boy he removed to Louisiana, was appointed to West Point, and in 1833 was graduated and entered the army. He served several years on the frontiers, in the War with Mexico, and then entered the quartermaster's department as lieutenant colonel. He resigned after the outbreak of the Civil War; was soon appointed quartermaster general in the Confederate Army with the rank of colonel; organized the Confederacy's transport and supply service; resigned 10 Aug. 1863; and lived uneventful life thereafter.

MYERS, Jerome, American artist: b. Petersburg, Va., 20 Mar. 1867; d. New York, N. Y., 19 June 1940. Recipient of numerous awards and represented in various art galleries throughout the country, Mr. Myers was nationally famous for his street scenes of New York. He studied first at Cooper Union, New York, and later at the Art Students' League. He was awarded a bronze medal at the St. Louis Exposition, 1903; the Clarke prize of the National Academy of Design, 1919; its second Altman prize, 1931; Carnegie prize, 1936; the Altman prize, 1937, and the Isador gold medal, 1938. His 'The Night Mission' is owned by the Metropolitan Museum of Art; his 'The Old House' by the Brooklyn Museum of Art; and his 'The End of the Street' by the Chicago Art Institute. He is represented also in the Corcoran Gallery, Washington; the Rochester Art Museum, the Milwaukee Art Institute, Newark Museum; Los Angeles Museum; Del Gado Museum, New Orleans; Whitney American Museum of Art, New York; and in the John Gellatly Collection owned by the Smithsonian Institution. He was a National Academician, a member of the New Society of Artists, and other societies.

MYGALE, the technical and book-name of the Theraphosidae a species of trap-door spider (*Mygale ovicularia*) which has been known to catch small birds and kill them. It is a native of India, Australia, Africa and South America. It is the largest of all the spiders, being very stout, dark brown or black in color, and its thick legs covered with hairs mingled with longer bristles. It builds its nest in trees. Similar species are brought into our ports in bunches of bananas. These spiders are nocturnal in their habits and feed usually on in-

sects, but they do not hesitate to attack any living creature which seems unable to resist them. The fact that the bird-spider will actually kill birds and suck their blood was asserted by Madam Meriam in 1705. Her statements were received with doubt, but long after were verified by Bates. The specimen he observed on the Amazon River was nearly two inches in length, the legs expanding seven inches. He saw the monster on a tree-trunk beneath a deep crevice in the tree, across which was stretched a dense white web. "The lower part of the web was broken, and two small finches were entangled in the pieces; one was quite dead, the other was still living and was smeared with the filthy liquor or saliva exuded by the monster." The natives call them *aranhas caranguejeiras*, or "crab-spiders." The hairs on the body and legs come off when touched, and "cause a peculiar and almost maddening irritation." This, Bates thinks, is not due to any poisonous quality residing in the hairs, but to their being short and hard, and thus getting into the fine creases of the skin.

MYIASIS, a diseased condition in humans caused by the larvæ of flies. House-flies may affect the skin of man by depositing eggs in wounds and on ulcerations, or may invade the external cavities of the body. The eggs hatch, and the maggots cause much local irritation and symptomatic fever; or in the case of the bot-fly (q.v.), penetrate the skin deeply and produce large abscesses. The maggots, as a rule, do not penetrate other tissues. The principal flies that infect wounds, etc., are the flesh-fly (blue-bottle), blow-fly, screw-worm fly, which deposits its eggs in the noses of persons who sleep unprotected during the day, and house-fly (q.v.). Internal myiasis may result from swallowing the eggs of flies in raw vegetables containing them, and sometimes eaten in salads, when the resulting larvæ are got rid of by vomiting or purgation. Consult Howard, 'The Insect Book' (1901).

MYLITTA, mi-lit'ta, an Assyrian goddess, identified by the Greeks with Aphrodite. She was, as goddess of the moon, the female principle of generation.

MYLODON, the "ground sloth," a genus of extinct edentate mammals, of sloth-like structure and large proportions, the remains of which occur along with those of the Megatherium and Megalonyx, in the recent or post-Tertiary deposits of South America and also scattered widely over the United States from Pennsylvania on the east to Oregon on the west. In size the *Mylodon robustus* — the most familiar species — attained a length, in some instances, of 11 feet. A large piece of the very thick hide of one of these mylodons, found in a cave in Patagonia, shows that they were covered with a dense coat of yellow-brown furry hair, similar to that of the brown bear of the Rocky Mountains. See **GROUND-SLOTHS**; **MEGATHERIUM**.

MYNA. See **MINA-BIRD**.

MYOPIA, mi-ō'pia, nearsightedness. See **ASTIGMATISM**; **COLOR BLINDNESS**; **EYE**; **EYE STRAIN**; **VISION**, **DEFECTS OF**.

MYOSIN, or **MYOSIN-FIBRIN**, a simple proteid substance, usually classed as a globulin (see **GLOBULINS**), which separates

from muscle plasma after death, in the form of a clot, which is analogous to the clot of fibrin that is formed under similar circumstances in blood. Its average composition is carbon, 52.28 per cent; hydrogen, 7.11 per cent; nitrogen, 16.77 per cent; sulphur, 1.27 per cent, and oxygen, 22.03 per cent. It does not exist in the living muscle, being there represented by two other proteids called myosinogen and paramyosinogen, respectively. The stiffening of the muscles after death (technically known as the "rigor mortis") is due to the formation of the myosin-fibrin and myogen-fibrin clots in the cells of the muscles. Myosin is insoluble in water, but dissolves in dilute saline solutions. It is soluble also in dilute acids and alkalies, which convert it promptly into albuminates. Consult Hammarsten, O. (Mandel's translation), 'A Textbook of Physiological Chemistry' (New York 1908).

MYOSOTIS. See **MOUSE-EAR**.

MYRES, mīrz, John Linton, English classical scholar: b. Preston, Lancashire, 3 July 1869. He was educated at Winchester and studied at New College, Oxford. From 1895-1907 he was tutor at Christ Church and lecturer in classical archaeology (1903) at Oxford University, junior proctor (1904-05), secretary to committee for anthropology (1905-07) and examiner in final classical school (1906-08). From 1907-10 he was Gladstone professor of Greek and lecturer in ancient geography at the University of Liverpool, then Wykeham professor of ancient history at Oxford. In 1914 and 1927 he was at the University of California. He traveled through Greece and Asia Minor, conducted excavations in Cyprus (1894 and 1913), and reorganized the Government Museum (1894). He has written 'A Catalogue of the Cyprus Museum' (1899), in collaboration with Dr. Ohnefalsch-Richter; 'A History of Rome' (1902); 'The Dawn of History' (1911); 'Handbook of Cesnola Collection of Antiquities' (in Metropolitan Museum of Art, 1914); 'The Political Ideas of the Greeks' (Bennett Lectures, 1926); 'Who Were the Greeks?' (1930).

MYRIAPODA, a group formerly classified among the arthropodan animals, but now better known. It includes the groups of *Chilopoda*, or centipedes, and the *Diplopoda*, millepedes or galley-worms. The features common to all are the elongate worm-like body consisting of a head and behind this the trunk of numerous similar leg-bearing segments, not divided into thorax and abdomen. They are all inhabitants of dark and obscure places, — under logs and stones and the bark of trees. All but two species are terrestrial; those two are semi-aquatic, living between the high and low-water levels on the sea-coast. Closer analysis shows that the chilopods are related to the crustacea while the diplopods are allied to the worms. In the chilopods the head bears a pair of groups of simple eyes, a pair of antennæ and three pairs of jaws (mandibles, maxillæ, labium), while the first pair of trunk appendages becomes connected with the head and serve as poison-jaws. The trunk-segments are all similar, and each bears one pair of legs, the number of segments ranging from 15 to 170 or more. The body-segments are flattened and the reproductive openings are at the hinder end of the body. Most of the chilopoda are carnivore

ous and ferocious and are very quick in movement. The most noticeable members of the group are the centipedes (*Scolopendridæ*) of the tropics, some of which are nearly a foot in length and have considerable poison powers. See CENTIPEDES.

In the diplopoda the head bears but two pairs of jaws (mandibles and lower lip or gnathochilarium), while the trunk-segments are usually circular in section, and each, except a few near the head, bears two pairs of legs, an exception to the otherwise universal rule among arthropoda of a pair of legs to a somite. The range of segments is even greater than in the chilopods, there being nine in *Pauropoda* and 200 in some *Polysomida*. The reproductive organs lie ventral to the intestine, and the external openings are a little behind the head. The *Diplopoda* live mostly upon decaying vegetation and are extremely slow in movement. For protection they rely upon the very thick and hard walls of the bodies, and in some species upon peculiar stink glands which open on the sides of the body. See MILLEPEDE.

Fossil Myriapods appear in the Devonian rocks and they are found in all parts of the world to-day. Most of the American species are described in Bollman's 'Myriapods of America' (United States National Museum, 1893).

MYRICIN, a substance formed by the combination of palmitic acid with an organic radical known as "myricyl." It has the chemical formula $C_{30}H_{51}O.CO.C_{17}H_{33}$, and occurs in beeswax, forming the chief portion of that part of the wax which is insoluble in alcohol. Myricin melts at 162° F., is readily saponified by alcoholic potash, and may be obtained in the form of feathery crystals by deposition from its solution in ether.

MYRISTIC ACID, an organic acid occurring in the form of a glyceryl ether in nutmeg butter, from which it may be prepared by saponification and subsequent distillation at a pressure materially below that of the atmosphere. It is a component also of butter, wool fat, coconut oil and oil of quince seed. It has the chemical formula $C_{14}H_{27}.COOH$, and is insoluble in water. It is very soluble in hot alcohol, however, from which it separates, upon cooling, in the form of lustrous laminæ, melting at 129° F., and boiling at 250° F. It may be prepared by melting stearolic acid with potash. A number of compounds of myristic acid with the metals are known, as well as several ethers and other organic compounds. Myristic acid gives their characteristic name to the myristica fats of which it forms the predominating part as trimyristil glyceride.

MYRMECOPHILY, in its broadest sense, signifies a condition of friendship with ants, and includes the subject of the various insect and other guests kept or entertained in their nests by ants. The side of it to be considered now, however, is the relation of certain plants to ants, when this relation is, or is supposed to be, of mutual advantage. Such plants are termed myrmecophilous and are of great variety, especially in the tropics. That ants inhabit all sorts of cavities in trees and large vascular plants, such as cacti, is well known, and often they dig out the pithy interior or otherwise modify these cavities into homes

fully adapted to their requirements. "The rigid vegetable tissues are an excellent protection against enemies," as Wheeler points out, "and the cavities are moist, dark and free from molds, so that they make perfect nurseries for the larvæ and pupæ." It is a matter of common knowledge also that in most cases the plants thus utilized furnish a good deal of food-material for the ants. The great mass of observations bearing on this matter have been interpreted by many naturalists to support the view that many plants have developed as an adaptation through natural selection elaborate structures to be used as ant-lodgings or even to furnish these insects with food-substances in order to attract certain pugnacious ants whose stings are formidable, because they will protect the plants from leaf-cutting ants or other leaf-destroying enemies. In this alleged symbiotic arrangement the insects profit by the supply of special food-material growing on the plant and return the service by warding off harm; and it is said that mutual adaptations have occurred between the chosen kind of plant and the species of ant that inhabits its appointed cavities. The great body of facts collected by Fritz Müller, Schimper, Belt, Semper, Beccari and others are accepted, and some of their interpretations are admitted, but recent students of the matter regard the theory as far overstrained and doubt that true symbiosis can be shown to exist in any case. The latest and fullest treatment of the matter will be found in William M. Wheeler's 'Ants' (New York 1910).

MYRMIDONS, mer'mī-dōnz, a former people on the southern borders of Thessaly, who accompanied Achilles to the Trojan War. They were said to have received their name from Myrmidon, a son of Zeus and Eurymedusa, the daughter of Cleitos, whom Zeus deceived in the disguise of an ant. He was married to Peisidice by whom he became the father of Antiphus and Actor. For Æacus, a descendant of this branch, Zeus changed the ants of the island of Ægina to men. This legend was the origin of the belief that the Myrmidons emigrated to Thessaly under the leadership of Peleus.

MYROBOLANS, the dried fruits of various species of East Indian trees, all having more or less astringent properties. They are used for dyeing and tanning, especially the latter. The trees are of the genus *Terminalia*, family *Combretaceæ*, the chief being the belleric myrobolan (*T. bellerica*), and the chebulic (*T. chebulica*).

MYRON, Greek sculptor: b. Eleuthera, a seaport of Boeotia, about 450 B.C. He was, along with Phidias and Polyclethus, a pupil of Ageladas, the founder of the Peloponnesian school of sculpture, and made his renown at Athens as a versatile and masterly worker in bronze, silver and every other art material. He executed statues of gods, heroes and especially of athletes, many of which were set up in the temples at Delphi and Olympia. The most celebrated among them was that of swift-runner Ladas, and the Discobolus, or hurler of the discus, a work of art highly admired by the Romans, as is proved by the many Italian copies of it made in marble, the finest of which is that now in the Lancelotti Palace, Rome. On

medals, basins and reliefs there are still extant copies of his Athenian work, 'Athene Throwing Away the Flute,' etc. A marble copy of his 'Marsyas' is in the Lateran Museum at Rome, and one in bronze is to be seen in the British Museum. He was equally successful in the representation of animals. His 'Cow' in the market at Athens was the subject of many a laudatory epigram and was brought to Rome in the time of Cicero. Myron gave a somewhat exaggerated slenderness to the human form, which he modeled with exquisite beauty and anatomical accuracy, but was not a master of facial expression.

MYRRH, a popular name for a gum resin produced by *Commiphora myrrha* of the family *Burseraceæ*; also for a garden plant *Myrrhis odorata* of the family *Apiaceæ*. The resin is obtained from Arabia and adjacent Africa from a small, prickly, stunted, gray-barked tree which bears few small denticulate leaves and smooth, brown, egg-shaped drupes as large as currants. The drops, granules or tears which in commerce are brown, red or yellow are at first rather oily, yellowish and soft, becoming brittle with age. They have a pleasing balsamic odor and lasting, bitter, aromatic taste. From earliest times they have been used for making incense and other perfumes and have been reputed useful in medicine, especially for cleansing the mouth and sweetening the breath.

Myrrh, the garden plant, also known as sweet cicely, has been cultivated for ages as a sweet herb for flavoring salads and culinary preparations. It is little grown in the United States except by people of rather recent European ancestry.

MYRTACEÆ, a family of trees and shrubs, the myrtle family, comprising about 70 genera and more than 2,000 species widely distributed in warm climates, but sparingly in temperate. It is one of the most important families of economic plants. Some of the species, such as pomegranate (*Punica granatum*), guava (*Psidium spp.*), luma and ugni (*Myrtus*) yield important fruits; some such as cloves (*Eugenia sp.*), allspice (*Pimenta*), furnish highly valued spices; and still others, especially species of *Eucalyptus*, are leading timber trees of the world. The species are characterized by simple, entire leaves generally dotted with glands; perfect flowers in racemes or sometimes cymes, and various kinds of fruits. See MYRTLE.

MYRTLE, a popular name for several unrelated plants of which the following are probably the best known: Crape myrtle (*Lagerstræmia indica*) of the family *Lythraceæ*; running myrtle (*Vinca spp.*) of the family *Apocynaceæ*; sand myrtle (*Leipophyllum spp.*) of the *Ericaceæ*. When unqualified the name generally refers to various species of *Myrtus* of the family *Myrtaceæ*. The common myrtle (*M. communis*) is an evergreen shrub native of the Mediterranean region and western Asia, whence it has been introduced into gardens throughout the warmer temperate climates of the world for its foliage and flowers. It was used in Greek festivals as sacred to Venus and as the symbol of beauty and youth. Its aromatic leaves and berries were formerly used in medicine and its bark in tanning, uses still made of them to some extent in southern

Europe. The small leaved myrtle (*M. microphylla*), the luma (*M. luma*) and the Chilean guava (*M. ugni*) yield edible fruits, for which they are planted in South America and to some extent in California.

MYRTLE TREE. See BEECH.

MYSIA, mîsh'i-a, Asia Minor, a name anciently applied to a district which varied greatly in extent at different periods. The name first occurs in the legend of Telephus, who became king of Mysia. Under the Persian Empire Mysia was the name of the section between Lydia on the south and the range of Ida on the north. It was united with the region on the north and with Lydia in forming a single satrapy. After the overthrow of the Persian Empire by Alexander the Great, Mysia fell to Lysimachus (311 B.C.). Subsequently it formed part of the Græco-Syrian kingdom, then of the kingdom of Pergamus, and finally, in 133 B.C., was bequeathed with the rest of the kingdom of Pergamus, by Attalus III to the Romans by whom it was made a part of the province of Mysia. When the divisions of Asia Minor were settled under Augustus, the name of Mysia was given to the whole of the northwestern district bounded on the north by the Propontis (Sea of Marmora), east by Bithynia and Phrygia, south by Lydia and west by the Ægean Sea. Under the later empire Mysia was erected into a separate proconsular province and received the name of Hellespontus. The inhabitants were thought by some ancient writers to be of Thracian or Lydian descent.

MYSORE, mî-sôr', or **MAISUR**, mî-soor', India, the dynastic capital of the native state of the same name, 250 miles west by south of Madras, in a valley 2,450 feet above sea-level, dominated on the southeast by Chamundi Hill 1,040 feet higher, with a temple on its summit. It is on the Mysore State Railway. Modern enterprise on European methods has greatly improved the town. The streets are broad and regular, the houses intermingled with trees and temples, and there are several fine modern public buildings, including the British residency. The fort built in European style, and separated from the town by a promenade, encloses the maharaja's palace, and the dwellings of his officials.

MYSORE STATE, or **MAISUR**, a native state in Southern India, lying between lat. 11° 36' and 15° 2' N. and 74° 38' and 78° 36' E. Its area is 29,433 square miles; the greatest length north and south being about 230 miles; east and west about 290 miles. It is bounded by Madras districts on all sides except on the northwest where it is bordered by two Bombay districts and toward the southwest where Coorg intervenes. It consists of an undulating table land, much broken up by chains of rocky hills and scored by deep ravines. Its form is that of a triangle with the apex to the south at the point where the western and eastern ghât ranges converge in the group of the Nilgiris. The general elevation rises from about 2,000 feet along the north and south to about 3,000 feet at the watershed which separates the basin of the Kistna to the north from that of the Cauvery to the south. Isolated rocky peaks called "droogs" appear on all sides at an elevation of from 4,000 to 5,000 feet. The drainage

of the country finds its way east to the Bay of Bengal and there are three great river systems; the Kestna on the north, the Cauvery on the south and the Penner, Ponnaiyār and Pālār on the east. None of these is navigable, but they are sometimes used for floating lumber. They support an extensive system of irrigation by means of channels formed by immense dams, these channels tracing a course of more than 1,200 miles. There are no natural lakes in Mysore, but by embanking streams, tanks or reservoirs of all sizes are formed numbering some 30,000. Mysore is divided naturally into two regions: the hill country or Malnād on the west—a picturesque mountain land, with fine forests—and the open country on the east comprising the greater part of the state, known as Maidān or Bayalshime, where the towns are located. The products of the country vary with the water supply and nature of the locality. The level plains of black soil in the north grow cotton or millets; the tracts in the south and west are covered with plantations of sugarcane and rice; the lands irrigated from tanks yield coco-nut and areca palms; the red soil in the east produces rāgi and dry crops; the central parts covered with areas of coarse grass relieved by shady groves, are good for grazing. The principal mountain ranges besides the Ghāt ranges are the interior range, from 10 to 20 miles wide running between 77° and 77° 30' E. to the frontier; and a corresponding range in the west. The highest point is Mulainagiri, at an elevation of 6,317 feet. Granites and granite masses of the Achæan occupy the greater portion of the state and traversing these are metamorphic schists of Pre-Palæozoic Age. There are other more recent deposits. Granite exists in large irruptive masses. Wild animals and reptiles are abundant in the forests and streams of the south. Large fish are found in the west.

There are three seasons, rainy, cold and hot. The country is visited by two monsoons, the southwest, from June to November, followed by the cold season. The temperature ranges from 64° to 84° in the rainy season; and from 51° to 80° during the cold season. In the hottest season it ranges from 66° to 91°, rarely reaching 96°. The rainfall varies from 19 inches in the north centre to 360 inches on the crest of the Western Ghāts.

Mysore yields 95 per cent of the gold of India. Iron is found in small quantities and asbestos is an undeveloped industry. The manufactures consist of fabrics, silk and carpets, gold ornaments, copper vessels. Sandal wood carving is extensively carried on. Coffee, cotton-ginning, bricks, tiles, etc., are also among the manufactures. A system of railways radiates from Bangalore; the length of the railway open to traffic in Mysore is about 500 miles. For postal services, Mysore is now part of the Madras circle. There are Mysore state savings banks and life insurance companies. Famine, due to lack of rainfall, has often carried off many of the people, but measures have been taken to alleviate this condition, such as the extension of railways, irrigation and plans for relief work.

The government is vested in His Highness the Mahārājā, a chief justice and a court of three judges. The capital is at Mysore City.

but the administrative headquarters are at Bangalore. The administrative districts of the state are Bangalore, Kolār, Tumkūr, Mysore, Hassan, Spimoga and Chitaldroog. The officer in charge of a district is called the deputy commissioner who has a staff of assistants. The villages have local government under a pātel, a hereditary office. A representative assembly meets once a year, when the annual statement of finances is made. The government of India is represented by a resident. There are military systems, lesser courts, systems of land tenure and revenue, police departments, etc. Education was at first introduced by European missionaries and has been developed into a fine public system. There are now about 3,800 schools of all grades with some 125,000 male and 25,000 female students. Hospitals and asylums are also provided in the larger cities. The population of the entire state according to the most recent census is 5,978,892. Hindu castes predominate, the Lingayats forming the strongest sect. There are about 50,000 Christians, about 8,000 of whom are white. The principal cities are Bangalore, Mysore, Kolār, Tumkūr, Channapaina, Davangere and Tarikere.

The authentic history of Mysore as gathered from inscriptions, begins after the invasion of Alexander the Great in 327 B.C. After his retirement the north of Mysore came under the rule of the Andhra of Sātavāhana dynasty, extending down to the 2d century B.C. The various parts were under petty local princes who were frequently at war with each other, until in the 14th century the territory became a part of the Ballala Kingdom of Delhi, after the invasion of the Mohammedans. After their downfall a new Hindu sovereignty arose at Vijayanagar on the Tungabhadra. In 1565, this dynasty was defeated at the battle of Talikota and petty chieftains again divided up the state. The most important of these, the wodeyar of Mysore, seized the fort of Seringapatam in 1610 and founded the present state. Under Deva Raja it became a powerful kingdom. In the 18th century this dynasty was overthrown by the Mohammedan Hyder Ali, who, after a brief but brilliant reign, was defeated at Seringapatam in 1799, and the government was left to an infant descendant and an unscrupulous regent, Purnaiya. The British government took over the administration in 1831. In 1867, it was determined to permit the native rule, under British surveillance. In 1881, Maharaja Chamarajendra took the rule of the state, maintaining the standard of administration. In 1902 the ruler was vested with full powers. Consult 'Imperial Gazetteer of India' (Vol. XVIII, Oxford 1908).

MYSTERIES (Latin *mysterium*, from Greek *mystes*, initiate)—in ancient history, were among the Greeks, and afterward also among the Romans, secret religious assemblies, in which no uninitiated person was permitted to take part. They originated at a very early period. They seem to have had a double object—first, that of handing down the traditions relating to the divinities in whose honor they were celebrated; and secondly, that of teaching and practising religious rites. The true value of the mysteries did not lie in dogmatic teaching, but in the moral improvement apparent in

the votaries, in the comfort the rites gave in the present life, and the hopes they inspired for the world to come. The most important Greek mysteries were (1) the Eleusinian; (2) the Samothracian, which were celebrated in honor of the Cabeiri in all the places where these divinities were worshiped. (3) The Dionysia, at Rome called Bacchanalia, which were celebrated in honor of Dionysus or Bacchus. These latter mysteries were of so licentious a character that they were first forbidden in Thebes, and afterward in all Greece, as prejudicial to the public peace and morals. This was likewise done in Italy by a decree of the Roman senate in 186 B.C. (See BACCHUS). (4) The Orphic, consecrated to Dionysus Zagreus, the son of Zeus and Persephone. (See ORPHEUS). See also MIRACLE PLAYS.

Eleusinian Mysteries were generally held by the Greeks to be the most sacred of all the mysteries; and their great secrecy, intricate ritual and dramatic features were undoubtedly strongly influential in shaping the form of the ritual for many succeeding secret orders. They were connected with the worship of Demeter and Cora at Eleusis in Attica; and they appear to have had their origin in the ceremonies connected with the birth and death of the grain spirits. Demeter, in the ceremonies of initiation through which the candidate had to pass in order to become a member of the mysteries society, finally bestows agriculture upon man. The mysteries seem to have had degrees suggestive of the degrees in modern secret societies. All candidates had to become members of the society of the Lesser Mysteries at Agræ (near Athens), before they could enter that of the Greater Mysteries at Eleusis; and six months had to elapse between the two initiations. At both initiations the candidate made his own personal offerings or sacrifices to the gods, accompanied by fasting and other ceremonial practices in the nature of purifications; after which he wandered, or was led, through dark and intricate passages until finally he emerged into the presence of the deity upon whom streamed the light. As the Lesser Mysteries were celebrated in the early spring and the Greater Mysteries in the fall, the first probably represented the coming to life of dead nature and the latter the death of vegetation. A sacred peace declared some days previous to the opening of the ceremonies and continuing several days after their close permitted the pilgrims to the shrines and the candidates to come and go in peace, without any fear of molestation. The public ceremonies of the Greater Mysteries began with the bringing from Eleusis to Athens of certain sacred relics to be placed in the Eleusinia; the following day the celebrants put in an appearance and on the third day all the initiates (Mystæ) marched in procession to the Phalerum beach where they performed the necessary ceremonial bathing which was symbolical of purification. This was followed by two days devoted to offerings presented at various shrines throughout Athens. Early on the morning of the next day the relics were returned to Eleusis, escorted by a great religious procession, in the midst of which was the image of Iacchus. This occupied all day. The following four days and nights were given up to the secret ceremonies of the mysteries,

under the direction of the Hierophant, the Dadouchos (torchbearer), the Hierokeryse (herald) and the officiating priest. Eleusinian mysteries were also celebrated in various other places in Greece proper and outside of it, among these being Megalopolis, Phlius and Andania (in Messenia). The mysteries undoubtedly dated back to considerable antiquity, far as the earliest notice we have of them, they are possessed of an organized priesthood and the custom of choosing the Hierophant from one family (the Eumolpidæ of Eleusis), and the Dadouchos from another (the Kerykes). It is probable that these families, in early times, derived their family names from their offices, as the Jewish priests did.

Samothracian Mysteries. These which were originally two, were known as those of the Cabeiri. In the course of time they became four, Axieros, Axiokersa, Axiokersos and Kasmilos, in popular phraseology; though the grammarians identified them, respectively, with Demeter, Persephone, Hades and Hermes. It seems probable that they were the survival of tribal deities belonging to the same great family religion.

Gradually as time went on these mysteries, which had much of the spectacular and the mysterious which always appeal to humanity, spread throughout Greece, in their own form and under their own name or in the shape of evident imitations or of other closely related tribal mysteries. The worship of the Egyptian moon and mother goddess, Iris, which had early been introduced into Greece, spread rapidly throughout all the land round the Mediterranean and later into the cultured sections of western Asia. With this worship came foreign mysteries, which seem to have originated in the same form of nature worship as the native Greek mysteries. Other foreign mysteries, apparently also of similar origin, were introduced into Greece and appear to have taken root there. The Greeks seem to have been very fond of these semi-religious, semi-social mysteries and most of the prominent citizens appear to have belonged to one or more of them, much as people to-day belong to secret societies. The mysteries, however, had a deep meaning for the Greek, which the modern secret society does not have for its members.

MYSTERIES OF UDOLPHO, published in 1794, is the best known of the several novels of Mrs. Ann Radcliffe (1764-1822). The book was exceedingly popular at the time, the author receiving the unusual sum of £500 for it, and it was translated into French. Though the novel to-day is usually cited as an example of the florid, romantic style of the later 18th century, it is as a matter of fact an interesting and in many respects a powerful novel. It tells the romantic history of a young French lady, Emily d'Aubert, a heroine of much sensibility, but of considerable character, who has many trying and mysterious adventures in France and in Italy, and her marriage to the hero, Valancourt. The plot is an intricate and eventful one and the story deals with kind parents, unkind relatives, fine feelings, rude behavior, ruffians, and with mysteries, both of character and of circumstance, which are ultimately explained as natural. Perhaps the most distinguished parts of the book are the fine and often beautifully poetical descriptions of nature. The characters are less interesting in that nearly all seem to the modern reader to be unreal and melodramatic. The novel contains many good poems by Mrs. Radcliffe in the 18th century style. The tale is high in its class, but was, of course, overshadowed by the greater power and popularity of the Waverley novels, which owe something to it.

WILLIAM T. BREWSTER.

MYSTERY OF EDWIN DROOD, novel by Charles Dickens. It was the last work by this noted author and was never finished. Only eight numbers appeared, which were published in 1870, the year of the author's death. Numerous conjectures as to the outcome of the plot started or have been published from time to time, but his notes for the continuation of the work lead little toward unraveling his intent.

MYSTIC SHRINE, Ancient Arabic Order of Nobles of the, an order said to have been founded at Mecca in the year of the Hejira 25. The American order is composed only of Knights Templar and 32d degree of the Ancient and Accepted Scottish Rite, Masonic Order. The governing body is the imperial council with 101 subordinate branches called temples. The membership in America amounts to 300,000. See MASONIC FRATERNITY.

MYSTICISM, mis'ti-siz'm, a term derived from the Latin *mysticus*, Greek *μυστικός* mystical, secret, from *μύσος* a mystic, one initiated into mysteries, and from *μύειν*, to close the lips or eyes. Mysticism has for many minds a repellent sense, owing, as a recent writer has acutely observed, to its association with the delusions of visionaries and the extravagance not only of gnostics and Neoplatonists, but of many so-called Christian mystics, who, misled by a resemblance in terminology and statement, as well as in practice and discipline between the false and the true, have failed to observe a difference of infinite movement in principle and substance, and have striven to mingle into one system utterly antagonistic elements. Against extravagances such as these common sense has justly rebelled, while philistinism has found in them a pretext for making a clean sweep of

everything that would seem to raise religion above the plain man's apprehension and criticism.

For many, mysticism means simply an abandonment of all attempt to reconcile the "religious sentiment" with intelligent thought, a deliberate yielding of one's self to any unchecked and unverifiable fancy or speculation which seems to interpret the vague yearning of the soul after a transcendent being. Or it suggests a morbid quietism effected by a complete deadening of the affections and stupefaction of the mind, an Oriental contempt not only for everything material and natural, but even for all desire and existence; thus giving a Buddhist interpretation to the Christian discipline of self. Or at best the term stands for the exalted state of a few saint-like beings who have attained to a preternatural state of communion with the Deity, a state that has no practical interest to the ordinary mortal. But merely to tabulate the countless divergent senses associated with the term, not only in common usage but by authors of high repute, would exhaust the limits of the present article. The reader interested in the matter can consult some such work as that of Mr. Inge, mentioned below. One reason for the great discrepancy of usage has been already suggested. The confusion results mainly from the failure to view mysticism objectively in its ultimate meaning and relations, its origin and finality; an omission on which has followed a confusion of a primary and an essential property of human nature with one or other of its merely contingent modifications or partial tendencies; and thus abnormal and insane phenomena have come to be associated with a term which radically expresses the deepest movement and loftiest aspiration of man's being.

Like all other words of similar structure, the term mysticism connotes both a tendency or a realized experience, and a theory conversant therewith. For the sake of brevity the former acceptance may be here subsumed under the latter. The finality inherent in all creation—a tendency so imminent in nature that the effort to explain it away by reducing it to merely mechanical motion is impugned by the very ideas and terminology in which the attempt is conceived and expressed—reaches its highest expression in man's nature. Whether it be viewed as a process of natural selection, an adaptation to environment, a part of the struggle for existence, or under any other biological metaphor, this tendency to a purpose is as essentially—nay, surpassingly more so—a property of man as it is of any of the lower forms of life, vegetable or animal. If it be asked what is this purpose, this goal to which man ever presses, the answer may be given in terms of universal significance, that ultimately it is the realization of the plan of the universe. To this end, however, man strives unconsciously, and in a certain sense mechanically and involuntarily. Proximately, on the other hand, man is forever seeking self-realization, the development of his total self. This self, however, is perfected only in and by the exercise of its highest activity, and that activity can reach its complete perfection only when directed to and exercised on its highest object. Now man's

highest activity to which all other forms of energy within him are subordinate is mental, intellectual and volitional, and the highest object answering thereto is the True and the Good. The true as perfective of the intellectual side of human nature is identified with the Good as it satiates the appetitive or conative side, and both are concretely realized only in the Supreme Being, the Infinite, the Absolute, God. Now the mystic is one who, whether explicitly or implicitly, recognizes this essential relation of his nature to God and strives to adjust his life accordingly. It may of course be said that this is a conception of mysticism in the abstract, as seen from some transcendent viewpoint of man's personality, but not of mysticism in the concrete, as it occurs in actual life and history. In some measure this may be admitted. On the other hand it is the conception realized in those who have lived it out in the sanest form and the most perfect degree, and is inapplicable only in the case of those who directing their energies to some one or other partial object; to an object answering to only individual tendencies of their nature, to the neglect of the demands of their complete selves, have thrown their lives into disorder and confusion and have brought mysticism into obloquy and derision.

It is almost impossible to make any classification of mysticism that shall be adequately comprehensive. For the purposes of this article it will suffice to consider it as a rationalistico-natural or purely philosophical, and as a Christian-theological or primarily religious experience and theory; though these distinctive qualifications are far from being mutually exclusive; on the contrary they overlap at more than one point. Christian mysticism is substantially *philosophical* and of course rational; but it introduces a *supra* (not *contra*) rational element. On the other hand what is here called *rationalistico-philosophical* mysticism may and does with many of its disciples include Christian doctrine and practice, and in so far may claim the latter title. For the rest the distinction will become plainer from what follows.

I. Rationalistic Mysticism.—As a philosophical theory this attributes to the human mind the natural ability to rise to an immediate intuition of the Absolute, that is, God, and therein and thereby to an intuition of all truth. This immediate vision whilst reflective and contemplative is not attained so long as the mind remains on the lower level of ordinary discursive reasoning. Such thought being, it is claimed, confined to the sensible, to empirical phenomena, cannot attain to higher ideal truth. To contemplate the Absolute, man must withdraw his mind from the world of sensuous phenomena, inhibit all discursive activity, and concentrate his mental energy. As the mind escapes from the mists of earth the rising light of a higher vision is felt. In that vision the lower cognitive powers become inactive, the very consciousness of self is obliterated and the mind is absorbed in ecstasy. The ecstatic state is a condition pre-required for the contemplation of the Absolute. This state, however, is attained only through ascetic practices and he alone who reaches its heights is enabled to contemplate pure ideal truth and manifest it to others as he has perceived it. In ecstasy, more-

over, the mind becomes interpenetrated, even identified with God. Nay more, ecstatic vision is one and the same with the act in which the Deity contemplates His own self: "the eye with which the ecstatic sees God is the eye with which God sees Himself." Philosophical mysticism thus terminates in pantheism.

II. History.—The birthplace of this form of Mysticism is the Orient. Brahmanism (q.v.) is a finished mysticism. For it Brahma is the sole existent. What is Brahma, and what is not Brahma is nothing. Things mundane are distinct neither from Brahma nor from one another. They are simply modifications of Brahma. So long as the mind conceives of them as distinct it is in a state of delusion. From this delusion it must free itself by penetrating into the vision of the unity of all things in Brahma. To this end man must perform works of penance and sacrifice, cut himself loose from the sensile and sensuous world, and by concentration of his entire physical energy absorb himself in the All; that is, lay aside all self-activity and allow the One alone to work within him. Then will the light of vision rise on his mind and in everything I shall see the Brahma, the eternal self-existent One, the All. Oriental mysticism was transplanted to the West by the Neoplatonists in the form of emanational pantheism. (See here the primal One and the primal Good; from Him emanates directly the *Nous*) wherein are contained the ideas of all things and from which proceeds the world-soul. The human mind is in turn an emanation from the world-soul and, remaining essentially included therein, it lives in essential connection with the *Nous* even as the latter remains in essential union with the primal One. Thus is the soul enabled to rise to an immediate vision of the primal unity. Sense cognition is simply a dream of the soul from which it should withdraw and sink itself in its centre, the *Nous*; and as the latter is essentially the universal *Nous* revealing itself in the human soul and absorbed in the contemplation of the primal One, therefore is the human soul likewise through the indwelling *Nous* able to reach this same contemplation of the original unity; and when it arrives at this state all images, thoughts and even self-consciousness disappear and the subject enters the state of ecstasy.

This mysticism more or less modified played its part in later times. Aside from the Persian Sufi, who in the Middle Ages cultivated mysticism within the pale of Islam, there appear among the Christian people of the West tenets that strongly suggest the Indian and Neoplatonic mysticism, for example, with Meister Eckart (q.v.) and the school of German Mystics emanating from him. Eckart is at present defended against the charge of pantheism; nevertheless it is undeniable that his mysticism touches very closely on the boundary line that separates the Christian from the pantheistic world-view. Eckart distinguishes two factors, the "basis" (*Fünklein*, spark) and the power of the soul, analogously to his distinction of God between the basis or "ground" and the divine persons. The "ground" of the soul places in essential union with the "ground" God. There is something in the soul, he says, that is identified with God, that is one with

and not simply united to Him. It is uncreated. This something is the "spirit" the ground or basis of the soul. Here the "ground of God is my ground and my ground is God's ground." Now this divine spark in the soul he continues, is the organ of mystical contemplation. The "powers" of the soul do not reach God immediately. If man is to see God, the vision must be mediated by a light which is God Himself. And this light shines in the "ground" of the soul. Therefore does the soul see in the "spirit" God's pure essence as it is in itself. The "spirit" or "ground" of the soul penetrates into that "ground" in God, in which the latter is pure simple unity neither Father nor Son nor Holy Ghost. There, in this its "ground," the spirit seeks God, there to know and love Him without medium or veil. There is "my eye and God's one eye, one vision, one knowing, one love. The eye whereby I see God, is the same eye wherein God sees me. In order, however, to reach this vision of God in His "essence" (ground) man must first of all forsake all sin by genuine repentance. Next he must withdraw from all outward things, from himself and his "powers" and concentrate himself entirely within the essence of his soul; and having reached this state he must "leave" himself to God, hold himself passive and allow God alone to work within him. (Gottlassenheit.) Then will there arise in the essence of his soul (ground) a heavenly light. In this light God reveals to man the entire "ground" of the Deity; the whole essence of God becomes revealed to man. The soul likewise flows into God; its essence and life passes over into the essence and life of God; man is deified, is born a son of God; just as is the Eternal Word.

Subsequently the mystical Theosophists Valentine Weigel and Jacob Böhme built on the teaching of Luther who was in close sympathy with the "German Mystics," a form of mysticism which in many respects surpassed what most men will call the extravagance of Neoplatonism. A few expressions of Böhme will suffice in this connection. The soul he teaches has its source and origin in the essence of the Godhead; in its "ground" the light of God is kindled. Now in and by this divine light the soul is enabled to enter into the very heart of the Deity and to see therein without any intermediate the primal generation of God in the three principles of being, and the process of becoming of all things. As I then, he says, earnestly uplifted myself to God, the spirit of God broke through me and my spirit broke through unto the inmost generation of the Deity and in this light did my spirit see all things. The influence of Böhme is seen later in the philosophy of Schilling (q.v.).

Neoplatonic mysticism modified by Protestant doctrine reappears in the 17th century in the mystical speculations and practices of the Cambridge Platonists Cudworth, Henry More and John Smith. Other noteworthy mystical writers in England during the same century were George Herbert, Francis Quarles, Henry Vaughan, and in the following century William Law.

III. Christian Mysticism.—A recent writer has greatly simplified this subject by defining mysticism as "the love of God," and he quotes

in confirmation an author whose genius and amiable personality have endeared him hardly less to those who differ from him in religious belief than to those who venerate him as Saint Francis de Sales. Speculative theology, he says, tends to the knowledge of God. Mystical theology to the love of God,—mental prayer and mystical theology are one and the same thing. They are neither more nor less than the loving intercourse which the soul holds with God. In this sense every Christian whose practice accords with his profession is more or less of a mystic and differs from the highest mystic, the saint, not in his mysticism but in the degree of his mysticism. The term, however, is usually restricted to the higher degree of unitive insight. This simplification of the subject will doubtless be mistrusted, mostly by those who insist on associating all mysticism with mystery and in placing both if not against at least above reason. They should, however, remember that all even human love in a measure transcends reason. Feeling, instinct, sympathy, antipathy, telepathy, likewise, how quickly and far they elude psychological dissection! It may well be then that in the intimate communion of God with the soul which He permeates there are psychical acts and states of which reason and common sense can give no distinct account, "upraising strains that from the memory slip and fall away," as was the case in Dante's experience. But while mystical phenomena have in common with many ordinary psychical, especially emotional, experiences that they escape rigorous analysis, they lend themselves equally with their familiar analogues to a philosophy and even a certain though higher psychology. This statement will of course be a commonplace to those who are familiar with the great masters of mystical theory, such as Saints Dionysius, the so-called Areopagite, Augustine ('Confessions,' Engl. trans.), Bernard (Engl. trans.), John of the Cross (Engl. trans.), Thomas à Kempis, or the more modern authors mentioned below. For the benefit, however, of those who are not thus informed a very brief summary of the principles of Christian mysticism is here subjoined.

1. As in the macrocosm, the world of living organisms, the law is universal that all life emanates from life, *omne vivum ex vivo*, and as in the scale of their various kingdoms the higher raises up and assimilates the lower the latter receiving an essentially new and greater perfection from the former, so in the microcosm, the minor world of the human individual. Here, too, life is from life and life is from above; and the perfection of the lower consists in assimilation to the higher.

2. Beyond the natural life in man, the soul or mind, Christian Mysticism discerns a supernatural life consisting radically in a principle of activity higher than that of man's purely mental and volitional operations and consequently energizing in higher forms of thought, belief, hope, aspiration, love, etc.

3. The existence and supernatural character of this life and its activities are accepted in the first instance on faith, the data of this belief being found in the Bible, especially the New Testament. The foundations of this faith it is claimed are rational and the workings of the

higher life are confirmed by experience and attested by manifest effects.

4. Essentially and objectively this higher life consists in the vivifying operation of the Divine Spirit within the human soul; accidentally and subjectively it consists in the responsive co-operation of man's mental activities with the Divine influences.

5. The reception of this higher life is normally conditioned by certain spiritual dispositions and lines of conduct—notably of faith, love, prayer, repentance and self-discipline. The soul is thus prepared by alienation from carnal and inordinate propensities and rendered more sensitive to higher stimuli.

6. According to the degree of the soul's co-operation with the indwelling Spirit of God the former becomes proportionately assimilated to the latter. The soul thus passes from what is known as the purgative to the illuminative stage of mystical life.

7. This assimilation culminates in the act of contemplation which is distinguished from meditation in that it is not elicited with mental strain and does not apprehend its object, the divine presence or cognate truths, by inference; but in consequence of the immanent light simply gazes intuitively thereon; *contemplatio pertinet ad simplicem intuitum veritatis*, as all the mystics teach. The clarity of this act or state of vision begets sentiments of admiration, *contemplatio est perspicua veritatis jucunda admiratio*, as Saint Augustine says, and fills the consciousness with joy and rapture. The faculties are herein not merely *passive*, for contemplation is a *vital activity*, though the divine influence is the primary source of its elevation and application to the corresponding truths. The Church censured the teaching of the Spanish mystical writer Molinos on the question of the soul's passivity in contemplation,—a theory which was taken up by Madame Guion in France, and eliciting Fenelon's (q.v.) sympathy, entailed the well-known controversy with his great contemporary Bossuet (q.v.).

8. The unitive or contemplative state in so far as it is susceptible of psychological analysis is essentially intellectual, the mind being absorbed in intuition; it is, however, no less essentially volitional and in the sanest sense emotional, the whole adhesive power of the soul being drawn out in love of the object contemplated. Obviously, however, the two forms of energy—intellectual and emotional—act and react upon one another and in the intenser states of mental absorption entirely interfuse, all psychological differentiation being obliterated and the entire field of consciousness bathed so to say in light and love of the object contemplated. With the intellectual activity is generally though not always associated representations of the imagination wherein the object contemplated is symbolized. The object-matter of contemplation is primarily God or some of his attributes. Secondly it may be any divine manifestation in the created, inanimate or animate order, above all in this respect the humanity of Christ. With many of the mystics the suggestion of the divine perfections reflected from almost any object in nature was enough to lift them at once to a condition of wrapt contemplation.

9. The strictly contemplative condition varies in duration from moments to several hours,

dependently on preternatural and natural conditions. In the highest stage it may become practically habitual and yet leave a normal residue of attentional energy amply sufficient for all the demands of every-day life. Oftentimes it is associated with extraordinary psychical phenomena such as ecstasy, supernal revelations, visual or auditory—states wherein the mind sometimes though not always loses consciousness of self and of all else save the object contemplated. These are not, however, as many suppose, essential properties of mystical experience, but are rather effects resulting from the absorption of the psychical energy. An asserted similarity of these states to the well-known phenomena transpiring under the various forms of somnambulism, obsession, divided personality and the like, has led many psychologists to confound all mystic states with abnormal psychoses. The subject here opened out is a large one. The reader will find it fairly discussed in 'The Psychology of the Saints.' Suffice it to note with M. Joly that the true mystical state as realized in the saints' experience is not a "disintegration" of the powers of the mind; it is an aggregation of the closest possible kind, which derives its strength from a higher principle under the control of which it forms and sustains itself. It is not a "narrowing of the field of consciousness" but rather the opening out of a wider field, at the cost, if we may use the expression, of a narrowing of the field of passing sensations and empty illusions. Neither is it a "division of the personality" although it certainly evokes what may be called a "new personality," and that at the cost of great sacrifice and much suffering. This "new personality" is not a medley of divided and disordered parts. It exhibits cohesion, a strength and a unity above anything else which psychology can show us. This "new personality" also retains whatever was best of the original personality and these surviving elements combine peacefully with the new.

10. None the less the Saints, the typical mystics, were fully alive to the fictitious balance of purely natural, both normal and abnormal, subjective states to genuine mystical experience and writers on the subject have down certain signs for discerning the true from the false. Usually they point to the "fruits of the Spirit" as enumerated by Saint Paul (Gal 5, 22); "charity, joy, peace, patience, benignity, goodness, longanimity, mildness, faith, modesty, continency, chastity." The essence of all these fruits of true mysticism is self-denial, love of self-sacrifice and humility; only where such dispositions are habits can the subject be said to "walk by the Spirit." This mental attitude the mystics observe shows itself in subjection to the will to God and to lawful authority, a care to avoid self-obtrusiveness, a tenderness of conscience, zeal for self-control, deep interior peace even in the midst of misunderstanding and persecutions. On the contrary, they say where the opposite signs prevail, self-conceit, obstinacy, an appetite for singularity, moroseness, refusal of humiliation, sentimentality, devotional observances, unrest and such like—all being indications of pride, vanity or some form of sensuality—there the subject, though seemingly wrapt up to the third heaven, will

found to be the victim of an active or a passive illusion.

11. From the foregoing principles it should be inferred that *Christian* differs essentially from purely rational mysticism in the primacy it gives to *divine* influence in mystical experience. The uplifting and sustaining of the intellect and will in communion with God are due not in the first instance to purely innate endowments but to a transcendent light and energy. Christian mysticism as a theory ignores or pretermits none of the ascertained facts and legitimate inferences of psychology and philosophy, but it claims to supplement this knowledge with principles and deductions of a religious and theological character. The higher influences thus postulated though distinct from the normal life of the mind, just as the higher mental powers are themselves distinct yet not severed from the sentient and organic activities. Thus genuine mysticism by its sharp distinction between the mental activities and the immanent Deity steers clear of pantheism. The terms "deification," identification with God and the like in which mystical writers speak of the contemplative state are meant to express the close union of the soul with God but not a unity or substantial identity.

IV. History of Christian Mysticism.—

Mysticism as an experience is as old as humanity. The patriarchs Abraham, Isaac, Jacob, Moses, are described in the Bible as men who while not exempt from human failings, lived more or less habitually in converse with God, while the prophets from Samuel to the Baptist passed much of their lives in the abiding realization of the divine presence. The unitive or highest form of mystical life culminates in Christ, who though of necessity perpetually conscious of His Divine Personality nevertheless frequently retired from human association to commune with His Father in the solitude of the mountain or desert. Christ became for all future time the pattern of the mystical life while His Personality, deeds and words have formed ever since the chief subject-matter whereon the genuine mystical mind has been nourished. As his example and teachings spread abroad and the realization of their power deepened in the Christian consciousness the tendency to devote more and more of life to mystical contemplation increased. Spontaneously and gradually at first and accelerated afterward by the pagan persecutions which drove numbers of the early Christians into the deserts the eremitical and subsequently the monastic state grew up and developed, at first in the East and in Egypt and later on throughout western Europe. Monasticism (q.v.) was and is essentially an institution established as a means to facilitate and conserve the contemplative life. Some of the religious orders were founded almost exclusively for this end. Others, and these the majority, aimed at combining the contemplative with the active life, a so-called mixed status wherein the cultivation of an abiding consciousness of the Divine Presence should fructify and energize in labor for human welfare. How successfully this aim was accomplished is told in the history of monasticism and the biographies of such men as the Gregories, Basil, Benedict, Bernard, the Fran-

cises, Dominic, Borromeo, Loyola; and of such women as Hildegard, the Elizabeths, the Catharines, Teresa and other well-known heroes and heroines, of human as well as of divine charity; all of whom drew inspiration and energy for lives of continued self-sacrifice from an almost uninterrupted communion with the Unseen.

Though monastic retirement and discipline facilitate and foster the genesis of mystical habits, they are by no means essential thereto, as is patent from the case of numberless men and women who in every age have successfully united a high degree of contemplation with every variety of secular occupation. Here again the lives of the true mystics, the Saints, show that the cultivation of an abiding converse with God culminating frequently even in deep mystical union is compatible with all the duties and reasonable demands of social life.

V. Mystical Theology.—It is with mysticism as with every other human experience, theory follows on life. Speech precedes grammar, thought logic, conduct Ethics. *Primum est vivere deinde philosophari*. As mystical tendencies and habits spread and strengthened, there gradually grew up a mass of facts and inferences which constituted in time the body of a mystical theory, or what is known as mystical theology, and which took its place in the evolution of Christian doctrine as a sequent of moral theology. Mystical experiences were analyzed and systematized, principles induced therefrom and clarified in the light of Biblical and Patristic teaching, and practical rules for discernment and guidance in the mystical life were formulated; the whole developing by degrees into an organized science or discipline. The writers eminent in the formative stage of mystical theory were Saints Basil, Gregory of Nyssa, Gregory of Nazianza, Chrysostom, John Climacus, Cassian, Gregory the Great, Ambrose and Augustine. The first systematic work on the subject was that of Dionysius, the so-called Areopagite. In the intense intellectual ferment that followed the triumph of Christianity the Neoplatonists endeavored to set up against Christianity a world-religion whose controlling tenet it was that the universe is simply a phenomenon of the divine life, the human individual a manifestation of the divine essence, God coming to consciousness in man. Dionysius opposed this teaching, vindicating the Christian doctrine that in the union of the human soul with the Deity it retains its distinct entity. During the Middle Ages the works of Dionysius became for the mystical writers what the 'Sentences' of Peter the Lombard was to the Scholastics, a text for the numerous commentaries of eminent writers such as Hugh and Richard of Saint Victor, William of Paris, Bonaventure, Dionysius the Carthusian, Gerson and others. The Scholastics, likewise especially Aquinas, based their treatment of mystical phenomena on the Areopagite. The influence of Neoplatonism (q.v.) lingered, however, in the writings of Erigena, even though he translated the works of Dionysius.

A tinge of Neoplatonism moreover clings to the 14th and 15th century writers, Tauler, Suso and Ruysbroek, who theorized more in the interests of an intellectual union with God, while the most eminent teacher of practical

mysticism—union of will—was at this time Thomas of Kempen. In the subsequent centuries practical mysticism is systematically represented by Saints Teresa, John of the Cross, Francis de Sales and Ignatius of Loyola. The works of these writers have for the most part been translated into English. Among the later mystical authorities may be mentioned Louis of Blois, John of Avila, Louis of Granada, Louis da Ponte, James Alvarez, Alphonsus Rodriguez, Nieremberg, Lancicius, Surin, Godinez, Scaramelli, Benedict XIV and Schram.

MYSTROPETALON, a genus of leafless root-parasites constituting the tribe *Mystropetalæ* of the order *Belanophoræ*. It contains two South African species. It is known by the two or three free stamens, cubical pollen-grains, and the two-lipped staminate and bell-shaped pistillate flowers. The stem is sheathing covered by imbricated scales; the flowers in dense heads or spikes. They are monœcious, the male flower being on the upper and the female on the lower part of the spike. The fruit is a rounded achene.

MYTENS, mī'tēnz, **Daniel**, Dutch painter: b. The Hague, about 1590; d. Holland, 1642. He went to London, England, and was welcomed at the court of James I; he was appointed painter royal by Charles I and was much favored by the king and aristocracy. Many of his portraits, which are bold and spirited in conception, broad in treatment and of admirable color, are in Hampton Court. When Van Dyck came to England he gradually eclipsed in royal favor the glory of his predecessor, who returned to Holland.

MYTH, a general name for certain kinds of folk-lore stories, historic tales setting forth the processes of nature, or beliefs about religion, custom, tradition, etc., and differing from fable (q.v.) and from legend (q.v.). See **MYTHOLOGY**.

MYTHICAL ISLANDS, imaginary islands described in popular fable, romance and song, supposed to have existed in all ages in the several oceans of the world. The Islands of the Blessed were creations of the Greeks, who there placed the homes of all who had been first mentioned by Plato, and situated in the realm of eternal bliss. The lost Atlantis was first mentioned by Plato, and situated in the same part of the world. The fairy isle of Avalon is a feature of Celtic mythology, presenting

an exact counterpart to the Greek Island of the Blessed. The mythical land of Saint Brendan is also of Celtic origin and was thought to lie off the west coast of Africa, where, even as late as the 18th century, frequent expeditions searched for it. The Island of Seven Cities was also long sought for, and its settlement is ascribed in legends to the Christian refugees from the Iberian Peninsula, who had been driven out by the Mohammedans. Marco Polo's 'Cipango' was probably Japan. Probably the best known mythical lands or islands during the Age of Discovery were the island of Bimini, in the Bahamas, and the island of Brazil.

MYTHO, MITHO, or MITO, French Indo-China, a town of Cochinchina, on the northernmost branch of the Mekong delta, about 50 miles by rail southwest of Saigon. Mytho is an important trading centre for the produce of Cambodia and Annam, and the railway from Saigon was the first built in the country. It has a college and a hospital. Pop. 30,000.

MYTHOLOGY. (Latin *mythologia*; Greek *μυθος*, a myth, and *λογία*, an account), includes the whole body of myths of a nation; the explanation, comparative study and interpretation of these myths. In the popular acceptance of the term, mythology, however, is used to signify the religious conceptions of races expressed in the form of tales and other accounts of their deities. This is a very restricted part of the broad field of mythological activity; for mythology covers the whole sphere of activity of races before the knowledge of the laws of nature came to replace the exercise of the imagination in the explanation of natural phenomena. It includes physical, historical, philosophical and religious myths, generally so intermingled and interdependent that it is often difficult or impossible to separate the one from the others, since the imagination was the great source from which they all sprang either as a whole or in part. Owing to this constant play of the imagination, such history as primitive races possessed rapidly became myth, and the myths assumed the form, appearance and intent of history. During the pre-scientific ages, the greatest of all virtues was credulity in the scientific, philosophical and religious beliefs of the mass of one's fellows. Thus creed became a synonym for religion, or the true religion. To-day the Pueblo Indian speaks of one who holds to the faith of his ancestors, as "the true believer."

How Primitive Man Thought.—Man has apparently, since ever he began to reason, tried to explain the natural phenomena which most impressed him; and his success has always been in proportion to his scientific knowledge. At the beginning of his investigation of the phenomena of nature he was handicapped by an absolute ignorance of all natural law, and he was forced to reason from his experiences, much as the higher forms of animals do to-day. To him all life meant activity of some kind, generally translated into motion, and conversely, all activity meant life and volition. Thus when the sun, the moon and the other planets appeared and disappeared or changed form or position in the sky or appearance, they did so by their own volition. Behind the rushing of the wind, the fierce heat of the sun, the blighting cold of the north, the thunder of the clouds

the destructive fury of the hail and the lightning, the insatiable greed of the fire, the reviving force of water and of the midnight mists and summer showers were so many powerful intelligences, human in every respect except in their magic power, working each his sovereign will. So primitive man peopled the physical world about him with a multitude of beings essentially like himself in their ambitions, desires, motives, loves and passions. These he classified unconsciously according to their apparent swiftness, strength, cunning and constancy, the primitive virtues by which he set great store, and the impenetrable mystery by which they were surrounded. These were the supernatural people in contradistinction to the human race, which belonged to the natural people. But it is necessary to understand in what sense the word supernatural is here used. It never implies beings in any sense different from man himself except in the power of their magic. Even the form in which a supernatural being appeared was not of great moment, since he generally had the power to exchange his shape for another at will. The Sun-father, the Moon-mother, the Thunder-man, Morning-star, the great hunter, the Spirit of the Northland, the Summer-queen, the four great Wind Spirits, the ghostly spirits that rode upon the tempests, the dark beings from the under-world, the bright beings who peopled the Cloud-land, the Sky-land and the Sun-land were essentially human, and each lived in strict conformity with his surroundings and attributes. The Sun-father and the Moon-mother inhabited a shining wigwam in the Sky-land, the Frost-spirit a yellow ice tepee in the far North, on the outer border of the world. The Great Spirit sat far up upon the mountain and smoked his pipe; the four winds blustered and quarreled and had ambitions and loves, hatreds and jealousies essentially human. The waters moved, rippled and roared; the trees swayed and whispered; the leaves rustled; the clouds raced across the sky or lazily disported themselves in the sun. All displayed animation which made them fellow-actors with man on the stage of human activity. Into this curious world so unlike our own scientific age, the study of mythology introduces us. Here all nature is not only alive but instinct with the motives that move humanity to action; and no explanation or interpretation of mythology which fails to keep constantly in mind primitive man's ignorance of the laws of natural phenomena, and its effects upon his religious, scientific and philosophical views can be effective.

The Spirit of the Myth.—To understand the spirit of the myth one must learn to live over again the age which produced it. Without this, the practice of minute analysis of myth forms and derivation of myth names, the division of mythical stories into historical, scientific, religious and folk-tales and the minute grubbing of the ordinary scientific methods are of little avail. The study of mythology, like that of history, requires the power of imagination coupled with the patience and the trained methods of the scientific mind. However well the division of myths into classes may serve the uses of scientific study, the farther investigation is carried into the past the more all classes of mythological stories come into contact, min-

gle or blend with one another and reveal to us man trying to solve the primitive problems presented to the race. He develops these problems as he sees them and he explains them in conformity with his mode of science. In the very infancy of experimentally acquired knowledge he began to record his racial or tribal experiences in the form of stories, songs, symbols, dances and fixed ceremonies coupled with mystical formulæ and incantations. However unreasoning these may seem to the scientifically trained mind of to-day, they were nevertheless perfectly reasonable to primitive man who propounded them. The primitive myth-maker, which is but another name for the primitive philosopher and scientist, noticed that the sun moves away from the equator in the winter and that then the days are shorter and the nights longer, and he invented a legend or tale to account for it. This tale conformed in every respect to the belief of himself and the people of his day. The sun was a great and powerful being. The night spirit grew jealous of him and came and persuaded the people that the sun was an impostor, that he was not at all powerful since he allowed himself to be driven daily across the sky in the self-same track. So the people mocked the sun and taunted him with his impotence, whereupon he became angry and vowed to leave them in darkness. As he moved farther and farther to the south and the days became shorter and colder and the frost spirits seized upon all the land and froze over the lakes and rivers, the people became terrified and made sacrifices and offered dances and music to the Great Spirit, who finally relented and came back to them. But to remind them of the fact that he is all powerful and to make sure they shall never forget the insult they offered him, the sun goes south for a part of each year and shortens the days and lengthens the nights. In this myth the sun is essentially human and he acts as an all-powerful kindly human being would do, specially in a primitive age, were he insulted. To the primitive mind the scientific fact around which the story is woven was satisfactorily explained by the story itself. The existence of summer and winter is accounted for by a similar nature myth and though the two myths explain what is practically the same phase of nature, yet to primitive man there was no inconsistency in the stories simply because to him the gradual retreat of the sun southward and the coming of winter were two distinct events in no way connected with each other. Nor to him was the coming of summer dependent on the going away of winter, though the events happened to be coincidental, for both summer and winter were powerful beings each of which acted of his own volition. An Algonquin myth brings them together through the Great Spirit who went northward, with the spirit of summer in his hunting-jacket, and routed the spirit of winter out of his ice tepee and brought the summer to the northland.

Man and Nature.—To primitive man all nature was a struggle, not of elements, but of wondrously powerful and intelligent beings who were so real to him that they may be said to have formed as active and concrete a part of his existence as his household, his friends and his enemies. About these beings of his

imagination he built up a mass of traditional lore which was carefully handed down from father to son. In this lore he grouped and classified these supernatural beings; and to each he attached myths to explain their attributes, powers, functions and affections. Quite philosophical were these myths from the point of view of their creators. The earth received the seed and the sky sent the water that made it grow. The union of the two gave birth to the plant. Thus the earth and the sky became wife and husband. The sun was the greater light that ruled the day, the moon the lesser light that ruled the night, so in many theologies the former was the husband and the latter the wife, while the morning star, which appears with the sun, was their offspring. However, frequently in northern mythologies, where the light of the sun loses its great power for a part of the year, the latter frequently becomes the wife and the moon the husband. The moon governed the night, the season when the mists most frequently descend upon the land. So she becomes the goddess of fertility and as such is closely connected with all the water and vegetation deities. In Egypt Egyptian women prayed to Isis, the moon goddess, that she might look kindly upon them and bless them and make them fruitful. Roman women about to be married invoked Juno, the queen of heaven, that she might make them bear children; and Greek women made the same prayer to Hera, the mother of the stars, the queen of heaven, the moon goddess, the great deity of growth and fertility. Among the Aztecs and other cultured races of America, Indian women prayed the moon to make them fruitful; and offerings are still presented to the moon throughout Indian America with the same end in view. So strong is this belief that the Indian of Latin America frequently associates the name of the ancient moon goddess with that of the Virgin; and so powerful has the influence of the Indian become that not only Indian but also educated white women go to certain shrines of the Virgin to pray that they may be blessed with children. Indian women still hold up their new-born children to the moon-mother that she may bless them and make them, in their turn, fruitful. Being the patroness of growth, birth and fertility the moon became the deity of doctors and of medicine, and among Egyptians, Indo-Europeans, Aztecs, Mayas, Zapotecas and Mixtecas alike she took a kindly interest in people of feeble mind or those afflicted with skin or other scrofulous diseases. She was also the protectress of young children and animals both in Europe and America. She was the goddess of hunters and is frequently represented as armed for the chase. A close examination of all these functions and attributes of the moon goddess will show that they are closely related, interdependent and that the one naturally grew out of the others. The moon, in most of the Indian mythologies of America, was also the mother or the grandmother of the winds or some of them, who are themselves the bringers of the fruitful rains and mists. Here again the mythology is consistent.

Growth of Myths.—Examples might be given ad infinitum, but the foregoing are sufficient to show that the mythologies of most ancient races represented systems of thought,

of philosophy and religion which followed what were then rational lines of reasoning to those holding them and passing them on to succeeding generations. These ancient myths were at once religious, philosophical and scientific in that they contained within themselves the religious, philosophical and scientific knowledge of the race or what passed for such. Behind all mythologies are broad, general principles which lead, everywhere, to similar results. This accounts for the similarity of apparently unrelated myths in widely different parts of the earth, a similarity more marked in the nature myths. The comparative study of myths is of as much importance in the development of the science of mythology as is the comparative study of languages in the development of the science of philology; since the general laws that govern the making of myths seem to produce as closely related results as those that govern the formation of languages. Fairy tales, folk-tales, historical, philosophical, religious and scientific myths are continually running into one another. Often one short tale contains all these elements. Hence the field of study is not only very extensive, but the lines of thought are continually crossing and recrossing one another. Out of this confusing maze have come many theories, explanations and systems of mythology, most of them defective in that they have failed to survey the whole field and to take into account its broad general significance. Mythologies are like rolling stones, they take new forms as they move onward; and when they come to rest they gather extraneous mosses, which disfigure them often to such an extent as to hide their original forms. These changes are due to both external and internal influences, to action and reaction. Dissimilar myths are often found side by side apparently unaffected by one another; others are blended, while still others are so confused from long contact with one another that their original functions and attributes are not clearly discernible. Tribal influences, captives, slaves, foreign teachers and philosophers, servants, broken-down mythologies and the myths of subject people all have had their part in the shaping of the myths of nations. The constant rising and dying of religious, scientific and philosophical ideas, throughout the long unwritten history of man's progress toward civilization molded and shaped his myths; so that it is safe to say that however primitive myths may seem to us, there are probably no primitive myths in existence, since man even in his lowest stage of development to-day, has passed far beyond the condition of his ancestors when they first began to formulate their philosophy of the world about them in the stories that we have named mythology. In the days when the Romans had conquered the civilized nations surrounding them, Rome had already become the meeting-place of creeds or mythologies as had Athens in the days of Paul. And often there, the same deity was worshiped in separate temples and under separate guise. There were temples to Juno and Luna, both moon deities, to Hera the Greek goddess of the moon and Isis the Egyptian moon divinity. Each was the sovereign lady of the sky. And when Christianity stepped in and drove out the heathen deities, her triumph was only partial, for the converted heathen could

not so easily forget his past. To his new Christian saints he attributed the powers and virtues of his ancient gods. Upon the Virgin, as the lady of heaven, he lavished all the adoration given to the moon divinities, and he long loved to depict her as standing upon the crescent (the symbol of the moon). Thus the mythologies of the past have followed us into the present. In art, architecture, literature, philosophy, science, their names and influence greet us at every turn; for the dead past has not buried its dead. To-day the Christianized Indian throughout Latin America, in his Christian devotions, thinks as frequently in terms of his ancient gods as of his new faith. To the Virgin he attributes the power to send the rain, to fertilize the earth, man and beast; and he still puts food on the graves of the departed that they may have provision for their journey to the future world. Once a year, on the "día de los muertos" (day of the dead), when the dead are popularly believed to revisit the earth, he decorates their resting-places in like manner. Thus the present teaches that the mythologies of the past were constantly being modified and changed while they were exerting their influence upon dying or supposedly defunct mythological systems. This is the same principle that was at work when Greece, Rome, Egypt, Assyria, Arabia, Persia, India and the broken-down mythologies of the races who preceded them, acted and reacted upon one another. To these must be added the modifying influences of the Celt and the Arab, the German and the Mongol, who each, in his own way, left his mark upon the mythologies of northern Africa and southern Europe and Asia.

Classes of Myths.—Myths fall into several more or less well-defined classes: myths of origin, myths of the stars and the sky-land, folk-tales, myths of the future world and of ancestors, and myths relating to or explaining the elements. Origin myths account for the creation of the universe, of man, the other animals and plants; for the customs and habits of animals, trees and plants and for their peculiar markings and characteristics; for the origin of tribes and races and for their racial names, tokens and customs. Under this head come the culture gods, the inventors and bestowers upon humanity of the arts, trades and sciences, of which they naturally became the patron divinities. The myths of the sky-land and the stars, as the name indicates, deal with the solar, stellar and lunar stories and their relationship to one another and to the other dwellers in the sky-land. They are, in many mythologies, closely related with the creation and the culture myths. The moon-mother as the fructifier and the goddess of medicine is in the category of the culture heroes, of whom she is generally the mother or grandmother or near ancestor. The sun, as the vivifier, the sender of life and death, has a close relationship with the deities of vegetation. The myths of the future world deal with the mystery of death and connect the earth with the sky, the sun-land and the under-world. They include tales of the life beyond the grave, of visits of mortals to the land of the dead and of their adventures in the future world. Very varied are these myths among different peoples; and yet they are frequently wonderfully similar in

widely separated localities. They range from simple primitive tales to long heroic, circumstantially told stories in which the hero generally meets with many superhuman difficulties on his visit to the land of the dead. Closely connected with these tales are the ancestor myths, which form such an important part of the mythologies of many races. Myths relating to or explaining the elements are many and varied. The deified winds become the culture gods; the thunder, the great thunder-bird. The woods, clouds, mountains and streams are populated with spirits belonging to the elements who for the most part, are kindly disposed toward man and spend their time in helping him, when so inclined. In the Indo-European mythologies the sky was populated with a great host of supernatural and powerful beings and the mythologies of the more cultured of the American races were almost as liberal in their colonization of the aerial regions.

To these classes of myths already enumerated must be added the vast body of folk-tales which may be related to none of them, some of them, or all of them. Many races have numerous folk-tales, part of which may have once belonged to a now displaced and broken-down mythology. Side by side with these are often found moral tales which appear never to have had mythological significance or connection. These tales are quite plentiful among many of the American races, and those possessed by the Pueblo Indians are especially numerous and rich in incident. Tales of adventure linked to magic and consisting of a series of superhuman acts find a place among the Algonquin, the Ojibway, the Plains Indians and numerous of the Pacific tribes. These tales approach more closely to the European story than probably any other class of American tales. The characters in these stories are generally mythological in origin, however much they may seem to have lost their primal significance. Thus in the Indian story of Chacopee the Giant Killer, the hero who lives all alone in the heart of a great forest with his grandfather, follows a white rabbit who shows him a village of cannibal giants and tells him he has been born into the world to destroy them. He gives Chacopee a magic white feather for plume, a bag, a magic cord and a magic pipe. When Chacopee smokes the pipe out of it come the souls of the dead slain by the giants, who are frightened by them. With the aid of the cord he trips up the giants one after another, kills them and wins a race he runs with each of them except the grandfather-giant whom he is enabled, with the aid of the rabbit's charms, to defeat, after numerous adventures, all of a miraculous character. In most civilized or semi-civilized races the folk-tales are likely to be the largest body of popular stories in the language because they have been fashioned not only from long ages of folk-tales, but from the broken down myths and creeds of their ancestors and the races who preceded them. Folk-tales are especially plentiful among the Mongolian and Indo-European races. To this class of story belong the imaginative Celtic fairy tales. Folk-tales of a more primitive class are very plentiful throughout Africa and Polynesia; and many of a higher and more interesting type exist among the American Indians, some of which bear a curious resemblance to the

folk-tales of northern Europe and northwestern Asia.

Transformation.—The pre-scientific world firmly believed in transformations. This was the natural outcome of the personification of all nature. The wind was a person, yet he became invisible; the sun, also a person, hid himself, as did the moon and the morning star, behind a mask. The spirits of the forest whispered or roared or chatted, but they could not be seen by human eyes, either because they were hidden within the trees or because they had actually changed themselves into trees. The rivers, the mountains, the clouds were persons; but because of this power of self-transformation they could not be seen by earth-beings. If spirits could hide in trees and other moving things they could just as easily hide in sticks and stones. So inanimate objects, the residence of such spirits, became fetiches and wonder-working charms. Thus all nature, animate and inanimate, to the ancient myth was the abode of life, active, free and powerful as human life itself. All these different possessors of life might, on occasions, have the power of self-transformation. The simple fact of their appearing in some other than the natural human form was sufficient proof of their power of self-transformation. There were also, according to the belief of the mythological ages, other powerful beings who, in addition to possessing the ability to transform themselves, could bestow upon another the power of transforming himself. This was generally accomplished through the presentation of some wonder-working fetiche which enabled the owners to effect self-transformation. Thus the hunter, in the Algonquin tale of the 'Wolf-Man,' takes from the breast of the wolf-man himself a powerful amulet, which enables him to transform himself into any form he desires. Though the wolf-man pursues him and overtakes him at sun-down each day for six days in succession, he outwits him each time by his transformations and succeeds finally in drowning him by the same means on the seventh. In the tales of 'The Witch and the Wind-Man' the Mole-man shoots his magic arrow into the cloud on which his brother, the wind-man, is riding and drives it backward with terrific force. This he does several times until finally he wins the race against him. In the same tale the Old Witch changes herself into a monster white rabbit and thus lures the nine brothers to her den; but the wind-man rides the wind into the cave of the supernatural people and rescues the brothers before the witch has had time to get them fattened enough to eat. Many similar Indian tales are built about the supernatural power of self-transformation. Nanabozho, the great culture hero of the Algonquian races, under his many tribal names, is an adept at transformation; and in nearly all his adventures in which he takes the leading part he makes use of it. The heroes of the Plains Indians are constantly subjecting themselves to self-transformation. Everywhere throughout Indian America the belief in transformation is strongly exemplified in the mythology and folk-tales. Witches, wizards and other evil-disposed beings had the power of self-transformation, and unnumbered are the myths, legends and folk-tales in which they figure. In the rivers and the lakes and pools were other evil-dis-

posed spirits who delighted in luring people to death. These characters are well known in Latin and Greek mythology; but just as picturesque tales are told of them in the stories of other races. Under the name of the Malinche, the water siren shows herself as a beautiful woman on the tops of certain mountains in Latin America and lures men to her only to tear them in pieces. As the Llorona or "Crying one" she inhabits pools, lakes and rivers where she cries like a lost child in the night and draws her victim on to his death, for when he falls into the water she drags him down; so that there is no chance of escape for him. Or she may change herself into a "fool's-light" and lead some unfortunate into a bottomless swamp where death is equally certain. In all these stories self-transformation is the chief motive.

Ritual, supplying as it does the means whereby the correct relation to the various superhuman powers may be properly maintained, forms a very considerable part of mythology. Since the beings to be worshiped or propitiated are varied in attributes and powers the ritual and ceremonies dedicated to them must be varied also. In an age when the virtues of magic, charm, song, incantation, ceremonial dancing and instrumental music were firmly believed to be effective means of protection against adverse powers or of attracting the favorable attention of divine beings, extraordinary importance was placed upon the literal rendering of ritual and all other ceremonial forms. This belief helped to preserve ritual myths in a substantially unchanged form for generations; and many partially broken down myths repeated by primitive and other races are the survivals of the stories that once formed part of or went with rituals to explain them or to account for them.

MYTILENE. See LESBOS.

MYXEDEMA, or **MYXOEDEMA**, mīk-sē-dē'mā, constitutional disease attacking adults, chiefly those between the ages of 30 and 60, and four to six times more prevalent among women than among men. Myxedema is caused by a decrease or cessation of the secretion of the thyroid—deficiency diseases such as the goiters and cretinism (qq.v.); its symptoms reverse those of hyperthyroidism. Myxedema was identified by Sir William Gull (q.v.) in 1873 and is occasionally known as Gull's disease. Symptoms include a general slowness of mind and body due to weakened heart, increased weight, accompanied by a lessening of appetite, and falling hair; the mental changes induced may be simply neurasthenic or ultimately demented. The most striking symptoms, however, are the swellings on the body and the face, which enlarges, coarsens and assumes a masklike expression; the victim may become unrecognizable. Myxedema runs its course in 12 to 15 years and unless checked is likely to bring death from tuberculosis or asthma. It is sometimes hard to diagnose, being confused with nephritis or obesity; but yields readily to dosage with desiccated thyroid, *thyroidum siccum*, which may cure the disease within weeks. The thyroid is taken orally, intravenous injection not being recommended. Morphine is also dangerous to the myxedema victim. When the thyroid deficiency has been restored by graduated dosage up to three or four grains a day, the problem is simply one of maintaining proper thyroid balance in the body.

MYXOPHYCEAE, mīk-sō-fis'ē-ē (Gr. "slime algae"), known also as CYANOPHYCEAE and SCHIZOPHYCEAE, is the botanical class that includes the "blue-green algae"; it is the sole class in the division Cyanophyta (see ALGAE). The typical blue-green color of many of the genera is the result of masking of the chlorophyll *a* and *Beta*-carotene with the phycobilin pigments c-phycocyanin (blue) and c-phycoerythrin (red). Because of variation in the abundance of the phycobilins, the plants may be decidedly reddish or almost black in macroscopic appearance. Their color may also be affected by the presence of pigmented, gelatinous surface coatings which surround the cells. The pigments of Myxophyceae, unlike those of all other algae, are not localized in sharply delimited plastids, but, instead, are dispersed as droplets in the more peripheral cytoplasm, the chromoplasm. The cells are bounded by cellulose walls and frequently, in addition, by the pectic sheaths already mentioned; the latter may be firm or diffuent and are often stratified. The cells of Myxophyceae differ further from those of other plants in their lack of prominent aqueous vacuoles, in the storage form of their photosynthate, namely, "cyanophycean starch," and in the organization

of the nuclear material. The latter is not delimited clearly from the cytoplasm by a membrane and a nucleolus is absent. Division of the nuclear material simulates mitosis in a few genera but seems to be passive and effected by cell division in others. The possible relation of the Myxophyceae to bacteria has frequently been suggested, but the evidence hardly supports such a view.

The plant bodies of Myxophyceae may be unicellular, colonial or filamentous. Filamentous genera may be unbranched, branched or falsely-branched, the latter because of rupture of unbranched filaments through their sheaths. Reproduction of unicellular forms is by cell division. The colonial and filamentous genera multiply by fragmentation. Fragments of filamentous genera are known as *Hormogonia*; these may grow into new plants under favorable circumstances. *Hormogonia* may arise through the death of cells in the filament (*Oscillatoria*) or between *Heterocysts* (*Nostoc* and *Anabaena*). Heterocysts, which are transparent cells with nodular wall thickenings at their poles, are resistant and spore-like; they are capable of germination into vegetative filaments. *Akinetes*, also thick-walled dormant cells are granular and filled with reserve photosynthates; they also may germinate into vegetative phases. A few genera form spores (*Endospores*) endogenously. Sexuality has not been observed among Myxophyceae.

Scant information has been available until recently regarding the nutritional and photosynthetic activities of Myxophyceae. Study of a number of genera in bacteria-free culture has revealed that they are entirely autotrophic, although they may utilize organic supplements in culture media. Use of radio-active isotopes has firmly established the fact that certain Myxophyceae (*Nostoc* sp. and *Anabaena* sp.) have the capacity to fix gaseous nitrogen.

The Myxophyceae are found everywhere on and in moist soil, and tree bark, stones and timber and on the leaves of mosses and on and within liverworts and other plants (*Nostoc* in *Anthoceros*, *Anabaena* in *Cycas* and *Azolla*). They are abundant in both fresh and salt water and may be benthic or planktonic. *Polycystis* and *Anabaena*, among others, are genera which frequently appear in water blooms. A rather specialized group of Myxophyceae is present in hot springs in temperatures ranging up to 85°C. A number among these Myxophyceae precipitate rocklike deposits known as travertine (q.v.).

Consult Smith, G. M., *Freshwater Algae of the United States* (New York 1950); id., and others, *Manual of Phycology* (Waltham, Mass., 1951).

HAROLD C. BOLD,
Vanderbilt University.

MYXOSPORIDIA, mīk'sō-spō-rīd'ī-ā, an order of Sporozoa having its growing phase amoebic and reproducing constantly by spore formation during this period. They are chiefly parasitic on fish and amphibians but may occur in invertebrates; epidemics among fish and even silkworms are caused by members of this order. See also SPOROZOA.

MYXOSPORIUM, mīk'sō-spō'ri-ūm, genus of imperfect fungi of the order Melanconiales, resembling those of the genus *Glocosporium*. They grow on bark and one species, *M. Corticolum* causes a mild canker on apples or pears.

N The sequence *l, m, n* in the order of the letters of the alphabet is extremely ancient, and preserved with great regularity. Even in those scripts in which the old Semitic arrangement has been disturbed, these three tend to stay together, for example, Arabic (23, 24, 25). Ethiopic is an exception, having *n* 12th; *l* and *m* 2d and 4th respectively, with *h* interpolated. The view has even been advanced, and widely accepted, that the Latin *elementum* (-a) meaning alphabet (and hence elementary) is nothing but the names of these three letters (given as *el, em, en* by Latin grammarians)—supposedly the first three in a second row of letters, just as alphabet (that is, *a, b*) or *abecedarium* (first attested about the beginning of the 6th century) arose from the first two (or three) letters.

Be that as it may, and it must be admitted that the theory lacks proof, the form of the letter *n*, like that of *m* and *l*, has not varied greatly throughout the long history of the scripts derived from the North Semitic. It appears that the letter *m* is a differentiation of the labial from the dental nasal *n*; and in fact, in the final position, the alternation *m* and *n*, demanded in part by assimilation to the initial consonant of a following word (the Sanskrit *sandhi*), is frequent. Thus Greek, Celtic, Germanic, Balto-Slavonic all substituted -*n* for Indo-European *m*; Moabite, Aramaic, and Arabic have a plural in -*n*, where Hebrew shows -*m*. Assimilation also affects the place of articulation of a nasal medially. The participle of Latin *sumo* (classical *sumptus*, with -*p*- inserted as a glide) shows up in Italian as *sunto*; Gothic has *fimf* corresponding to Latin *quinque*, the former with a labial nasal (before *f*), the latter with a velar nasal (before *qu*).

But palatal and velar nasals are not commonly distinguished in the writing, though Sanskrit writes the cerebral, palatal, and velar nasals by symbols distinct from that of the dental *n*, and in Greek the practice arose of writing *γ* as a palatal nasal before *κ, γ, χ*. This came about from the fact that in the group *gn* the *g* passed into a palatal nasal, thus giving the symbol an additional value. A similar change took place in Latin (compare the pronunciation *signe, segno* in French and Italian), occasionally so written (*singnifer*), and English has to be content to use *ng* with this phonetic value (the technical symbol is *ŋ*), e.g. in *king*, as well as for -*ngg*- (as in *longer, finger*), and similarly *nk* for -*ngk*- (as in *lynx, monkey*). Fundamentally this variation is a matter of syllabic division (*ng*, when *g* belongs to the same syllable as *n*; -*ng-g*- when *g* belongs

to the following syllable). However, some of the northern English dialects have -*ng*- not -*ng-g*- in the medial position, and conversely the Midlands often have -*ng-g*- instead of -*ng*- in words like *singing*. In present participles (ending in -*ng*) the dental nasal *n* superseded -*ng* in early modern English, as is clearly shown by the spelling *standyn* for *standing* (*fardin* for *farthing*), and this utterance is still widespread and found among educated speakers. Conversely -*ng* has been substituted analogically for *n* (*chicking, gudging* for *chicken, gudgeon*), but this practice is mostly confined to the less well educated. Final -*n* is not heard after -*m* (*autumn* beside *autumnal, damn* beside *damnation*); *handicap* stands for *hand-in-cap*, and the loss of -*n* in unaccented monosyllables is responsible for the pairs *a* and *an*, *i*' and *in*, *o*' and *on*, and (with syntactical differentiation) *my* and *mine*, *no* and *none*. Misdivision is responsible for a *newt* (for *an ewt*, Middle English *ewte*) and other words (*nick-name, adder, apron, auger*) that have taken on or lost *n*-, as the case may be. This proves that the difference of juncture heard in *an aim, a name* is not stable.

As for the form of the symbol (the 14th letter of the North Semitic original script), in Cretan we find *λ* and in Sinaitic *~*. But already Phoenician and Moabite have *γ* or *γ'*, and the Greek *ν* and Latin *N* are readily traced back to this. The Slavonic *Н* (Cyrillic *Н*) is a slight and obvious modification of *N*. The Semitic name of the letter is *nūn* (whence Greek *νῦν*), and its apparent meaning is said to be "fish." Actually a fishlike symbol does appear, apparently with the *n*-value, in some Sinaitic inscriptions.

A syllabic -*n* (compare the article *M*) is heard in *mutton, heaven*, and a syllabic -*n* is occasionally substituted for it (in rapid speech after -*k*- as in *spoken, bacon*). Breathed *n* and *ng* (written *nh, ngh*) occur in Welsh as the result of mutation; in English, a partial assimilation to preceding *s* (in *snow*) has the effect of depriving *n* of some element of voice, but the combination is often unstable and in Latin it was the *s* that disappeared (*niuem* [acc.] is cognate, compare the treatment of *sm* described in the article *M*). Nasalization of vowels is often inadequately written by the symbol *n*, that is in French, where it is a strong nasal resonance (*vin, cent*). It usually affects a preceding vowel even when *n* remains a consonant (contrast the *a*, with a slight "nasal twang," in *man* with that of *bad*); and in many parts of North America nasalization may pervade the entire utterance.

Parallel to *nī* before *ū* is *nī* (written *n*), the standard pronunciation in words like *new*, though again in many parts of North America the consonantal *f* element is lacking. For bibliography see the article A; see also ALPHABET.

JOSHUA WHATMAUGH.

NABAL, nā'hāl, in Biblical history (1 Samuel 25:2-42), a wealthy sheep owner whose flock was protected by David and who afterward rendered tribute to him. Abigail, his wife, mollified David with gifts and flattery, and Nabal dying soon thereafter, David married her.

NABATAEANS or **NABATEANS**, nābātē'anz, an Arab people whose kingdom at one time extended as far north as Damascus. Around the end of the 4th century B.C. they were established in Petra, which they made their capital, and thereafter their sway was greatly extended. They forced the Edomites up into southern Judah. The location of Petra on the route of commerce from southern Arabia to Syria is credited with the prosperity of the kingdom in the 1st and 2d centuries B.C. and the 1st century A.D. The Nabataeans guarded their trade routes and grew wealthy by imposing customs' duties. At its height under Aretas IV (9 B.C.-40 A.D.) the kingdom reached to Damascus. The Nabataean kingdom was conquered by Trajan in 105 A.D., and became a Roman province. The Nabataeo, often identified with the Nabataeans, are said to be a completely different people. See also ARABIA—Petty States in the North.

NABLUS, nāb'lūs (ancient SHECHEM; later NEAPOLIS), town, Jordan, located in the northwestern region, between Mounts Ebal and Gerizim, 30 miles north of Jerusalem. It is a busy trading and industrial center, producing soap and olive oil, and is the seat of a Greek bishop. Shechem was important in patriarchal times, and has the traditional sites of the tombs of Joshua and Joseph and Jacob's Well. Abimelech ruled it, then destroyed it; Jeroboam I ruled as king of Israel from Shechem. The name of Neapolis, of which Nablus is the Arabic corruption, was bestowed by Vespasian. The town figured conspicuously during the Crusades. It was a religious center of the Samaritans, some of whose descendants still live here. The bulk of the population, however, is Moslem. Pop. (est. 1946) 24,660.

NABOB, nā'bōb (from Hind. *navvāb*, colloquial *nabāb*), the title applied to a native ruler in India. It also designated a provincial governor of the Mogul Empire. Europeans returning wealthy from the East had the word applied to them, and, by semantic widening, *nabob* came to be used to designate any very wealthy man.

NABOB, *The* (Fr. *Le Nabab*), a novel by Alphonse Daudet, published in 1877. One of the most highly finished of the author's works, it is a romance of manners and observation.

NABONASSAR, nāb'ō-nās'ēr, Era of, an historical era, reckoned from the accession of Nabonassar as king of Babylon in 747 B.C. In the time of Nabonassar the calendar was rearranged with the Ram as the vernal equinox, and as a result the Era of Nabonassar (or the Age of the Ram) came into use in the chronicles as

a reckoning device. The new reckoning never obtained full recognition in Babylon itself, but gained its main support in Egypt. Later, it had some use among the Greeks.

NABONIDUS, nāb'ō-nī'dūs (Assyrian *Nabū na'id*), Babylonian king: d. about 538 B.C. He was the last of the Chaldean dynasty to reign at Babylon (556-c.538 B.C.). Not a member of the family of Nebuchadnezzar II, he may have usurped the throne. He seems to have performed religious duties zealously, and to have restored various ancient shrines, but his neglect of the gods Marduk (Merodach) and Nebo (Nabu) brought him into conflict with the priestly class. His antiquarian interests, so strongly indicated by his inscriptions, are thought to have occupied him to such an extent that they were responsible for his disregarding the state's defense. He spent several years of his reign in the oasis Teima, in northern Arabia, during which period, it is believed, his son Belshazzar actually governed at Babylon. According to Eusebius, after Babylon had fallen Nabonidus fortified himself at Borsippa, only to be captured there by Cyrus the Great, who nevertheless treated him with kindness and permitted him exile in Carmania (now Kerman). A cuneiform record of Cyrus, however, indicates that Nabonidus was delivered over to Gobryas, Cyrus' general, and died in mysterious circumstances. See BELSHAZZAR.

NABOPOLASSAR, nāb'ō-pō-lās'ēr, king of Babylonia: r. 626-605 B.C. He was a Chaldean, not of the kingly line, and erected an independent kingdom in Chaldea in the second quarter of the 7th century B.C. Thence he extended his power to Babylon. During what appears to have been a struggle for power following the death of Ashurbanipal, king of Assyria, he declared his independence and, in alliance with Cyaxares, king of Media, began to take over Assyrian territory. His army was well trained in Assyrian methods of fighting, and eventually, in 612, he and his ally took Nineveh. The conquest meant that the Assyrian Empire was divided, with the southern part falling to Nabopolassar. In this new Babylonian Empire Chaldea was the dominant power. Nabopolassar met the threat of Necho II of Egypt by dispatching his son, Nebuchadnezzar II, against him; improved the irrigation around Babylon; and did much to beautify the city itself. Nebuchadnezzar II succeeded him.

NABOTH, an Israelite, owner of a vineyard in Jezreel, during the reign of Ahab, king of Israel (1 Kings 21). The palace of Ahab immediately adjoined this vineyard, which became an object of the king's desire and he offered to purchase it or give another in exchange for it. When Naboth refused to part with the "inheritance of his fathers," Ahab was bitterly disappointed, but his wife, Jezebel, sent letters in Ahab's name, sealed them with his signet and caused Naboth to be tried for blasphemy and treason on the testimony of two suborned witnesses and stoned to death. This crime brought down the curse of Elijah upon the guilty couple (2-26), which was fulfilled soon after in the fate of both. See AHAH.

NABU. See NEBO.

NABUA, nā'bwā, town and municipality, Philippines, located in Camarines Sur Province, in the southeastern part of Luzon, 19 miles southeast of Naga. The district is agricultural, producing among its chief crops rice and abacá. Gypsum is also produced. Pop. of town (1948) 4,595; pop. of municipality (1948) 42,946.

NACHTIGAL, nāk'tē-gäl, **Gustav**, German explorer in Africa: b. Eichstedt, Germany, Feb. 23, 1834; d. at sea near Cape Palmas, April 19, 1885. After studying medicine, he became a military surgeon, then went to Africa in search of health. In 1869 the king of Prussia sent him with gifts to the sultan of Bornu, in recognition of kindness shown to German explorers. His journey through Fezzan and Tibesti was over country hitherto untraversed by a European. He arrived at Kuka in 1870, thence explored Borku, Kanem, and the country south of Bornu, and on his way back to Cairo passed through Wadai. The years from 1875 to 1882 he spent in Germany arousing national interest in German colonization. He entered the consular service in 1882, becoming consul to Tunis, and in 1884 was German commissioner for the annexation of Togoland, Kamerun, and Lüderitzland. He died on his way back to Europe. Nachtigal's work marked a distinct era in the exploration of northern Africa and even more notably in German colonial policy. He wrote *Sahara und Sudan*, 3 vols. (1879-1889). His letters were collected in Berlin, *Erinnerungen an Gustav Nachtigal* (1887).

NACIMIENTO MOUNTAINS, nā-sē-myēn'tō, a prominent ridge in Sandoval County, N. Mex., lying between the headwaters of the Puerco and Jemez rivers. The length is about 40 miles and the highest peaks range from 9,000 to 9,700 feet. To the north they merge into the San Pedro Mountains. The rocks are uplifted granite with limestones, sandstones, and volcanic tuffs on the flanks.

NACOGDOCHES, nāk-ŭ-dō'chēz, city, Texas, seat of Nacogdoches County; altitude 285 feet; on the Nacogdoches and Southeastern and Southern Pacific railroads; 130 miles northeast of Houston. The region produces beef cattle, milk, and poultry. The chief manufactures are lumber, feed, fertilizers, cottonseed oil, filter clays, and clothing. Stephen F. Austin State College is located here.

Nacogdoches was named for a chief of the Tejas Indians. It was visited by de Soto, then by La Salle, and was first settled by Spaniards in 1716, when they set up a mission for the Indians. It was on the old Spanish highway called El Camino Real. From 1819 on it was the center of Texan revolutionary efforts, and Sam Houston lived here. The Old Stone Fort, built in 1779 and torn down in 1901, was re-erected in 1923. The city has a commission government. Pop. (1940) 7,538; (1950) 12,327.

NADAL, Ehrman Syme, American author: b. Greenbrier County, Va. (now W. Va.), Feb. 13, 1843; d. Princeton, N. J., July 26, 1922. He was graduated from Yale College in 1864 and became a secretary of the American legation at London, 1870-1871; 1877-1883. He published *Impressions of London Social Life* (1875); *Essays at Home and Elsewhere* (1882); *Notes of a Professional Exile* (1895).

NADAR, nā-dār', pseudonym of FELIX Tournachon (q.v.).

NADEN, nā'd'n, **Constance Caroline Woodhill**, English poet: b. Edgbaston, Birmingham, Jan. 24, 1858; d. London, Dec. 23, 1889. She studied at Mason College, Birmingham, and became interested in sociological problems. She investigated the Herbert Spencer system of philosophy and, together with Dr. Robert Lewins, became the advocate of a doctrine called Hylo-Idealism, an attempt to furnish a metaphysical system reconciled with the science of modern times. She is chiefly remembered for her volumes of *Songs and Sonnets of Springtime* (1881), and *A Modern Apostle and Other Poems* (1887).

NADIA, nū'dī-ā, district, West Bengal, India; area, 1,600 square miles; pop. (1941) about 870,000; capital Krishnagar. It is bounded by East Bengal, now part of Pakistan, and by the Bhagirathi River, and is drained by the Jalangi River. Sugar-cane processing, handloom cotton weaving, and clay-figure manufacturing are the chief industries. In 1947 the eastern part of the original district became the Kushtia district of East Bengal, Pakistan.

Nabadwip (formerly called Nadia) is an important town on the Bhagirathi River, 8 miles west of Krishnagar. It is a pilgrimage center and an ancient seat of learning, its Sanskrit schools being especially noted. Pop. (1941) 30,583.

NADIR, nā'dēr, in astronomy, that point of the heavens which is diametrically opposite to the zenith or point directly over our heads. The zenith and nadir are the two poles of the horizon; the zenith, nadir, and center of the earth are in one straight line.

NADIR SHAH, nā'dēr shā (originally MOHAMMED NADIR KHAN), king of Afghanistan: b. Dehra Dun, India, April 10, 1880; d. Kabul Nov. 8, 1933. He was Afghan minister in Paris from 1924 to 1926, then returned to Afghanistan. Following the abdication of Amanullah Khan in 1929, he seized the throne from a usurper and became king. He effected reforms and granted a new constitution in 1932, but was assassinated the next year.

NADIR SHAH (also known as TAHMASP KULI KHAN), king of Persia: b. Khurasan, 1688; d. June 20, 1747. He was of Turkish blood and poor family. He early showed his cunning by his attempts, while in the service of different governors of Khurasan, to take over that province, but was unsuccessful. Putting himself at the head of a band of robbers, he got possession of several strongholds in Khurasan. In 1726 he entered the service of Tahmasp II, for whom he checked the Afghans and defeated the Turks, and from whom he received four provinces. When Tahmasp was defeated at Hamadan by the pasha of Baghdad and was forced to cede the provinces on the Araxes to the Turks and to make a disgraceful peace, Nadir dethroned him (1732), put Tahmasp's son Abbas III in his place, and took the regency upon himself. The lost provinces were won back from the Turks, and in 1736, upon the death of Abbas, Nadir came to the throne. He invaded Afghanistan and conquered it in 1737-1738. He then seized most of India from

Mohammed Shah, the Mogul emperor. In 1739 he captured Delhi and pillaged it, the treasure he carried away including the Koh-i-noor diamond and the Peacock Throne. He subjugated Bukhara (Bokhara) and Khwarizm (Khiva), and so extended his empire that it reached from the Indus and the Oxus to the Euphrates and the Caspian. From 1743 to 1746 he was engaged in war with the Turks. Officers of his guard, weary of his brutal cruelty, assassinated him.

NAEGELE, nă'gě-lě, **Charles Frederick**, American portrait painter: b. Knoxville, Tenn., May 8, 1857; d. Marietta, Ga., Jan. 27, 1944. He studied figure and portrait painting under C. Myles Collier, William Sartain, and William M. Chase in New York City. He received many awards in competitive exhibitions and painted portraits of Peter Cooper, Charles L. Tiffany, ex-governor Roswell P. Flower, Gen. Joseph D. Bryant, and others. For his oil painting *Divinity of Motherhood*, he won a gold medal at Boston.

NAEGELI, Karl Wilhelm von. See NÄGELI, KARI WILHELM VON.

NAESTVED, nĕst'vĕth, city, Denmark, in Praestø County, southeastern Zealand (Sjælland). It is a market center and railroad junction. The city contains a church and Benedictine cloister dating from the 12th century. Pop. (1945) 15,104.

NAEVIUS, nĕv'vī-ŭs, **Gnaeus**, early Roman poet: b. probably in Campania between 274 and 264 B.C.; d. Utica, Africa, 204 B.C. or 202 B.C. He wrote in the old Saturnian verse an epic on the First Punic War; but he was better known as a dramatic writer, particularly for his comedies. Most of his plays, of which the earliest was produced in 235 B.C., were translations or adaptations from the Greek. His attacks on the Metelli, of the Roman nobility, provoked their anger and he was banished from the city and retired to Utica. Fragments only of his works have come down to us.

NAEVUS or **NEVUS**, nĕv'vŭs, a birthmark, portwine mark, or mother's mark. This disfigurement, which occurs most frequently on the head and trunk, but may also appear on the extremities, is essentially an enlargement of the minute veins or venous capillaries, which are dilated and anastomose, or unite among themselves to form a vascular patch generally of a deep-red color. The lesion is confined to the upper layer of the true skin. No pulsations are observable in the naevus, but if the circulation in the neighborhood is obstructed in any way, turgescence is seen and the color deepens. The familiar name of "mother's mark" or "longing mark," is applied to naevus, from a former belief that the lesion was the result of fear, fright, unnatural longing, or some such irritation acting upon the mother's constitution and communicating its effects to the unborn child, in the shape of this mark. Naevus, apart from questions as to its exact cause, appears to be invariably congenital in its nature. After birth it usually enlarges, and after attaining a certain size it may remain to constitute a permanent lesion or it may be absorbed with or without inflammatory action. The name birthmark is in some cases a misnomer because the naevus may appear at different periods of life. Naevus has been treated in various ways, by

excision with the knife, ligature, caustics, and other methods. The ligature has until recently been most commonly employed for its removal, threads being passed under the base of the naevus and tied so as to produce strangulation of the vessels. Electropuncture and electrolysis have also been much used, but the best of all discovered means is the use of carbon dioxide snow, a cone of which is made and pressed upon the naevus for a quarter or half a minute. This causes a blister, which dries and comes off, leaving no scar. In cases where a naevus is of limited extent and does not produce disfigurement or where, from its situation, it may not be seen at all in ordinary circumstances, the surgeon's advice generally is to let it alone. In subcutaneous naevus the lesion is more deeply seated. Subcutaneous naevus generally accompanies the more superficial form, but may bleed spontaneously and weaken the patient unless removed.

NAFA. See NAHA.

NAFELS, nă'fĕls, village, Switzerland, in Glarus Canton. There are a Capuchin monastery and a museum containing antiquities of the Middle Ages. Besides agriculture, industries include printing, cotton spinning, and the manufacture of structural iron products. At Näfels, on April 9, 1388, a force of 6,000 Austrians was defeated by 400 citizens of Glarus, who thus preserved their independence. The feat is still commemorated yearly. Here, also, in 1799 a Russian force under Aleksandr Vasilievich Suvorov attempting to invade France was defeated by French troops commanded by Gen. Gabriel J. J. Molitor. Pop. (1930) 2,948.

NAFTIA, năf'tĕ-ă, **Lago** (LACUS PALICORUM), a small lake in Sicily of volcanic origin, located in an ancient crater, over 900 feet in circumference, four miles north of Minco. Its waters are in a frequent state of ebullition from escaping carbonic acid gas; the emanations are fatal to birds and small animals. The lake was regarded with superstition by the ancients, and here the Siculi, the earliest known inhabitants, had a temple to two chthonic gods, the Palici of the Romans, which was the seat of the conspiracy and revolt against Rome 104 B.C.

NAGA, Nă'gă, name of two municipalities in the Philippine Islands. (1) On the east coast of Cebu Island, at the northern end of Bohol Strait, 11 miles southwest of the city of Cebu. It has a considerable coastwise trade. Pop. (1939) 25,850. (2) In the central part of Luzon, it is the capital of Camarines Sur Province. It stands on the Bicol River 5 miles south of San Miguel Bay. The region was visited by the Spaniards in 1573, and here the Spanish town of Nueva Caceres was shortly built on the site of the former native village of Naga. It became the capital of the united Camarines provinces; and with the division in 1919 into Camarines Norte and Camarines Sur, Naga was designated capital of the latter. Pop. (1939) 22,505.

NAGA, in Hindu mythology, the name given various deified serpents, which are represented as the sons of the Muni Kasyapa and his wife, Kadrii.

NAGANA. See CATTLE, DISEASES OF.

NAGANO, nā-gā-nō, city, Japan, capital of Nagano prefecture, in central Honshu 100 miles northwest of Tokyo. It is a center of the silk industry, and there are also manufactures of woollens and other textiles. In Nagano is the great temple of Zenkoji, visited each year by large numbers of Buddhist pilgrims. The city dates from the 7th century. Pop. (1945) 89,923.

NAGAOKA, nā-gā-ō-kā, city, Japan, in the Niigata prefecture, located in the northwest of Honshu 35 miles south of the city of Niigata. With the discovery of petroleum in the vicinity it became one of the country's principal oil production centers. From 784 until 794 it was the capital of Kwammu (Kwammu Tenno), 50th emperor of Japan of the Nara period. In feudal times it was of considerable importance, but its prosperity declined with the downfall of the Tokugawa and was only regained after oil had been discovered. Pop. (1945) 38,274.

NAGASAKI, nā-gā-sā-kē, city, Japan, capital of the prefecture of the same name, in the northwest of the island of Kyushu. Located at the end of a long, narrow bay, it is one of Japan's principal and deepest seaports. The city is beautifully surrounded by high hills on three sides, and is protected on the west side by the island of Takaboko, from whose steep heights many hundreds of Christians were once thrown to death. Nagasaki is the first port of entry for vessels arriving from the south or west. There are shipbuilding yards and a coaling station, and exports are chiefly coal, cotton goods, raw silk, tea, furs, salt, paper, and fishery products. Aircraft parts and electrical equipment are manufactured, as well as such products of Japanese art as articles of tortoise shell. The importance of Nagasaki dates from the 16th century, when it was opened to foreign trade and became the center of Christianity in Japan. Hideyoshi, military dictator of the country, made it an imperial city in 1587. All of Japan was closed to foreign trade during the years 1637-1641 with the exception of Nagasaki, to which access continued to be permitted to Dutch and Chinese ships. It was not until 1859 that vessels of all nations were again allowed to visit the seaport. On Aug. 9, 1945, during World War II, nearly half the city was destroyed by an atomic bomb dropped from a United States aircraft. Pop. (est. 1945) 142,748.

NAGCARLAN, nāg-kār-lān', municipality, Philippine Islands, on the island of Luzon, in the southeast of Laguna Province, between the headwaters of the Santa Cruz and the San Diego rivers 12 miles south of Santa Cruz. Pop. (1939) 14,762.

NAGEL, nā'gēl, Albrecht Eduard, German ophthalmologist: b. Danzig, June 14, 1833; d. Tübingen, July 24, 1895. He studied medicine at Königsberg and Berlin and established a practice in Danzig in 1856. In 1864 he was privat-docent at Tübingen and 1874 he became professor of ophthalmology there. He developed the theory of the identity of the retinas. He edited the *Mittheilungen aus der ophthalmia-trischen Klinik in Tübingen* after 1880, and published *Das Sehen mit zwei Augen* (1861); *Die Anomalien der Refraction und Accommodation des Auges* (1880); *Die Vorbildung zum medicinischen Studium* (1890).

NAGEL, nā'gēl, Charles, American lawyer and Cabinet officer: b. Colorado County, Texas, Aug. 9, 1849; d. St. Louis, Mo., Jan. 5, 1940. After attending school at St. Louis he studied Roman law and political economy at the University of Berlin, and in 1873 was admitted to the Missouri bar. He practiced law at St. Louis, and during 1881-1883 was a member of the Missouri house of representatives. From 1893 until 1897 he served as president of the city council of St. Louis, and in 1908 he was named a member of the Republican National Committee. He was secretary of commerce and labor in the Cabinet of President Taft from 1909 until 1913. Thereafter he resumed law practice in St. Louis, where he was recognized as an outstanding attorney.

NAGELI or **NAEGELI**, nā'gē-lē, Karl Wilhelm von, Swiss botanist: b. Kilchberg, near Zurich, March 27, 1817; d. Munich, Germany, May 10, 1891. Nägeli studied botany at Geneva under Augustin Pyrame de Candolle, and in 1840 graduated at the University of Zurich. In 1842 he began the teaching of botany at that university, and in 1848 was appointed professor extraordinary. In 1852 he went to Freiburg as full professor of botany, and from 1858 he occupied a like professorship at the University of Munich. He investigated the living matter and nuclei of cells and the mode of growth in cells, and he was credited with the discovery of the antheridia and spermatozooids of ferns. He also originated the micellar theory to account for the structure of organized bodies. English translations of his works included *Memoir on the Nuclei, Formation and Growth of Vegetable Cells*; and *The Microscope in Theory and Practice*, the latter in collaboration with S. Schwedener.

NAGLEE, nāg'lē, Henry Morris, American soldier: b. Philadelphia, Pa., Jan. 15, 1815; d. San Francisco, Calif., March 5, 1886. Entering the Union Army early in the Civil War, he participated in the Peninsular campaign of 1862, and in the following year was appointed to the command of the 7th Army Corps and of the District of Virginia. He retired from the army in 1864, and later went to California, where he cultivated a vineyard at San José, and gave his name to a well-known brandy.

NAGOYA, nā-gō-yā, city, Japan, capital of Aichi prefecture, in the southern part of Honshu, at the head of Ise Bay, 75 miles east of Kyoto. It was the first city in Japan to produce cloisonné enamelware. Glazed pottery, textiles, clocks, machine tools, automobiles, and aircraft are other products manufactured in Nagoya. The most notable edifices are the Higashi Hongwanji Buddhist Temple and the castle of Owari, built in 1610, which contains a valuable art collection. In 1945, during the closing months of World War II, the city was bombed by United States aircraft. Pop. (est. 1945) 597,941.

NAGPUR, nāg'pōor, city, Republic of India, capital of the state of Madhya Pradesh, 265 miles north of Hyderabad; under British administration it was the capital of the Central Provinces and Berar. The city is situated at an elevation of 1,100 feet above sea level, at the foot of Sitabaldi Hill, on which stands a fort which in 1817 was the scene of a memorable repulse of a Maratha army of 18,000 men by British defenders.

numbering 1,350. Nagpur is an important railroad center. Besides numerous cotton and woolen mills, there is an important hand-weaving industry. Nagpur University was founded in 1923; there are also technical and industrial schools in the city. Nagpur and the surrounding area passed under British control in 1853. Pop. (1941) 301,957.

NAGUIB, nā-gēb', **Mohammed**, Egyptian army officer; b. Khartoum, Egypt, 1901. Commissioned a second lieutenant at the age of 19 from Cairo's Royal Military Academy, he later attended Fuad I University, and in 1948 fought as a brigadier in the Israeli-Arab war. On July 23, 1952, in a virtually bloodless coup d'état, the Egyptian Army seized control of the regime, forced King Farouk's abdication, and in September installed General Naguib as premier and president. Lt. Col. Gamal Abd el-Nasser (q.v.), the leader of the revolt, in November 1954 caused Naguib's retirement on pension.

NAGUILIAN, nā-gē-lē'an, municipality, Philippine Islands, on Luzon in the center of the Province of La Union, 9 miles southeast of San Fernando. Pop. (1939) 15,933.

NAGYAGITE, nōd'yā-gīt, a sulpho-telluride of lead and gold with about 7 per cent of antimony, with the formula $\text{Au}_2\text{Pb}_{11}\text{Sb}_3\text{Te}_7\text{S}_{17}$. Besides these elements it often contains traces of copper and silver. It is found native in foliated masses and is hence sometimes called "foliated" tellurium, also granular.

NAGYBANYA. See **BAIA-MARE**.

NAGYKANIZSA, nōd'y'-kō-nī-zhō, city, Hungary, in the southwest part of the country. It is an important railroad center in a fertile agricultural region, and has numerous manufacturing activities. From 1600 to 1690 the city was in the possession of the Turks. Pop. (1939) 30,127.

NAGYKAROLY. See **CAREI**.

NAGYKIKINDA. See **VELIKA KIKINDA**.

NAGYKOROS, nōd'y'-kū-rūsh, city, Hungary, in the central area of the country 47 miles southeast of Budapest. Nagykörös is a market center in the midst of an extensive vineyard region. Pop. (1939) 30,656.

NAHA, nā-hā, or **NAWA**, nā-wā, seaport at the southern end of Okinawa, largest of the Ryukyu Islands, capital of the Okinawa prefecture. Enclosed in a coral reef, it is situated on the small Naha Bay. The major exports are fiber cloth, sugar, cotton, and silk. The Japanese maintained a military base and airfield in the vicinity. During May-June 1945, in World War II, the area was the scene of heavy fighting before capture by United States troops. Pop. (1945) 65,765.

NAHANT, nā-hānt', town, Massachusetts, in Essex County 9 miles east-northeast of Boston. It is on a long narrow peninsula which extends into the Massachusetts Bay four miles south from Lynn. There are two small villages, one Nahant, the other Little Nahant. The whole peninsula

is a residential section; many of the dwellings are summer homes. Though settled in 1630, the peninsula was not purchased from the Indians until a century later, when a Lynn farmer obtained a deed from Chief Poquamun for a suit of clothes, two stone pestles and a jew's-harp. A tavern, erected in 1802, and steamboat service to Boston in 1817 popularized it. Pop. (1950) 2,654.

NAHANT BAY, an inlet of Massachusetts Bay, in the northeast corner of Massachusetts on the south shore of Essex County. The peninsula on which Nahant is located separates it from Lynn Harbor.

NAHE, nā'ē, a river of Germany, a tributary of the Rhine. It flows through the Rhine Province of Prussia in a northeasterly direction from Birkenfeld to join the Rhine at Bingen, on the southeast border of the Hunsrück Mountains. The length is about 70 miles.

NAHUA, nā'wā, a linguistic and cultural division of American Indians inhabiting central Mexico. Their language, Nahuatl, the language of the Aztecs and closely related dialects, is a branch of the Uto-Aztecan family. In 1940 it was still spoken by more than 700,000 persons.

NAHUEL HUAPI, nā-wēl' wā-pē', or **TIGER LAKE**, Argentina, a lake on the boundary between the territories of Neuquen and Rio Negro, on the east slope of the Andes. It is 75 miles long, 10 miles broad and has an area of 300 square miles, dotted with several islands. It is fed by numerous mountain torrents and is drained by the Limay affluent of the Rio Negro. In 1690 the lake was discovered by Jesuit missionaries.

NAHUM, nā'hūm (Hebrew for "rich in God's comfort"), one of the 12 minor Hebrew prophets of the Old Testament, whose only record is the book, attributed to 607-606 B.C., that bears his name, a reference in Nehemiah 7:7, as "Rehum" being a copyist's error. Nahum is described as "The Elkoshite," either the son of a man named Elkosh, or native of a village of that name in Galilee, the location of which is uncertain. Saint Jerome states that the village in Galilee which bore the name of Elkesi in the 4th century A.D. was the prophet's birthplace, and the Galilean village Capernaum, signifying the "village of Nahum," has also been vaguely speculated upon. The tomb of the prophet is pointed out at Alkush near Mosul—ancient Nineveh—and his life has been associated with the great city, the destruction of which he prophesied. His book entitled *The Burden of Nineveh. The Book of the Vision of Nahum the Elkoshite*, should be compared with that of Jonah which illustrates the remission of God's judgments, while Nahum describes their execution, in a style full of animation, fancy and originality, and at the same time clear and rounded. His language throughout is classical and in the purest Hebrew, belonging to the second half of Hezekiah's reign, or to the time immediately following the defeat of Sennacherib before Jerusalem. Nineveh was at that time the capital of the great and flourishing Assyrian Empire. It was a city of vast extent and population; the center of the principal commerce of the world. Its wealth, however, was not

altogether derived from trade. It was a "bloody city," "full of lies and robbery," chapter 3:1. It plundered the neighboring nations; and is compared by the prophet to a family of lions, which "fill their holes with prey, and their dens with ravin," chapter 2:11, 12. At the same time it was strongly fortified, its colossal walls, 100 feet high, with their 1,500 towers, bidding defiance to all enemies. Yet so totally was it destroyed that, in the 2d century after Christ, not a vestige remained of it; and its site was for centuries a matter of doubt and uncertainty. The book is surpassed by none in sublimity of description. It consists of a single poem which opens with a superb vision of God's coming to judge the nations, chapter 1:2-8. Then follows verses 8-14, an address to the Assyrians describing their confusion and overthrow; verses 12-13 parenthetically consoling the Israelites with promises of future rest and relief from oppression. Chapter 2 depicts in vivid colors the siege and capture of Nineveh by its foes, the Medes and Chaldeans, and the consternation of the inhabitants. Chapter 3 describes the utter ruin of the great city and the various contributing causes. The fall of No-Ammon, Thebes in Egypt in 668 B.C., about half a century before, under the judgment of God, is cited, verses 8-10, to illustrate the punishment coming on the Assyrian Empire and the deliverance and restoration of Israel. With a wide view of the working of Providence, an avoidance of all moral or homiletic utterances, this powerful prophecy advances with majestic unity from its noble proemium to its close.

Consult Davidson, A. B., *Nahum, Habbakuk and Zephaniah* in Cambridge Bible series (London 1896); Smith, G. A. *The Book of the Twelve Prophets* (New York 1929).

NAIADACEAE, a small family comprising one genus, *Naias*, of submerged fresh-water plants, differing from the Zannichelliaceae in having the flower declinous, with one stamen and one ovary. There are about 12 species and varieties known to exist.

NAIDU, nā'ī-dōō, **Sarojini**, Indian poet, leader of the liberation movement, and governor of Uttar Pradesh; b. Hyderabad, 1879; d. Lucknow, March 1, 1949. Educated in England, in 1898 she married Dr. M. G. Naidu, principal medical officer of the Nizam. A decade later her flood relief work earned her the Kaiser-i-Hind medal, awarded by Edward VII. For 30 years Mme. Naidu worked for India's liberation and in 1925 she became the first woman president of the Indian National Congress. During 1928-1929 she lectured in the United States and Canada, having already achieved a reputation as a poet through the publication of *The Golden Threshold* (1905), *The Bird of Time* (1912), and *The Broken Wing* (1915). Elected president of the Asian Conference at New Delhi in 1947, later that year she was appointed governor of Uttar Pradesh (q.v.).

NAIL, an elastic horny plate on the upper or dorsal surface of the end of a finger or toe, as in man and monkeys. Hoofs, claws, talons, sheath-borns and the bills of birds are analogous. Nails and claws of all kinds are modifications of the epidermis, identical in formation and mode of growth. The root of the nail rests in a matrix, and when nails are de-

stroyed new ones will be formed if the matrix is uninjured. Nails are a support and a defense to the ends of the fingers and toes, assist in picking up small objects, and if healthy and in good condition add comeliness to the part to which they are attached. To most animals possessing them they are of great importance, giving a needed rigidity to fingers and toe and adapting them to a great variety of necessary utilities, as firmly seizing and holding prey (perfected in the retractile apparatus of feline claws), scratching, digging, searching crevices for food and as formidable weapons. In horse and cattle and other ungulated animals, they enclose some or all the digits and are called hoofs. In the sloths the nails assume a relative size and are used as a chief means in arboreal progression. In the Amphibia—as in some toads, efts, etc.—the nails are represented in their simplest form and appear as mere thickenings of the skin; the extremities of the digits.

In man the nails appear about the third month of foetal or embryonic life. After birth the nails of the hand grow at the rate of about one millimeter per week, those of the foot about one millimeter per month.

The health of the nails is affected, as is that of the skin, by local or general diseases. They may become thickened (hypertrophy) as the result of inflammation or a degeneration of nerve function; diminished in size (atrophy) from traumatic influences; malformed as the result of disturbed function of the matrix; degenerated from faulty nutrition and discolored in various diseases, the discoloration probably being in the tissues beneath. Nail biting is a bad habit not only leading to a morbid condition of the nails themselves but also sometimes being an indication of some types of nervous disease. The nails are also subject to parasitic diseases. A hang-nail is a sliver of skin attached at one end; it should be cut off close to the point of attachment. The familiar white areas on the nails are considered to be injury received by the nails in being macerated. The painful affection called ingrowing nail usually occurs in the great toe, not through alteration in the nail itself, but from constant pressure of the adjacent soft parts against its edge by a tight shoe. The irritation often results in the formation of an ulcer, extremely sensitive, and subject to continual aggravation from the embedded nail.

NAILS, headed spicules of metal, varying in size from those a little larger than ordinary pins to those several inches in length and from 1/40 to 1/4 of an inch in thickness. Up to the beginning of the 19th century they were made by hand as a household industry in various countries. In England, Birmingham was the centre of the industry, at one time giving employment to over 60,000 persons, and requiring a weekly supply of 200 tons of nail-rods from the iron-works of that district. In the United States, New England held a corresponding position and is even today the centre of the industry in America, with Taunton, Mass., as the great tack-making centre of the world. Almost all of the nail output of England was consumed at home and similar conditions obtained in the United States, France and Germany.

Hand-made nails were known as wrought or forged nails and were made from metal plates rolled to the required thickness and then

lit by slitting-rollers into nail-rods or split-rods of various sizes, corresponding to the required size and character of the nails to be forged and were sold to the nail-makers in bundles. The hand-nailer's outfit consisted of a forge for heating the nail-rods, an anvil (a small cube of steel), a hammer resembling that of a file-cutter (the face being sloped toward the handle), and a few "swages" (stamps or dies for producing ornamental or stamped heads).

To make a nail, a nail-rod was heated on the forge, hammered on the anvil and a portion of it the length of the required nail was cut off on a chisel attached to the anvil. The head was shaped in a vise which gripped the shank of the nail and had a counter sunk in the jaws of the vise into which the head was hammered to shape it. Various forms of heads were produced by employing different kinds

Principal Forms of Nails.

of counters. These forged or wrought nails included at least 300 different types, with at least 10 sizes in each type, representing a total of over 3,000 different names. The retail terms—fourpenny, sixpenny, tenpenny, etc.—were not only indefinite in themselves, but varied in different countries and even in different localities of the same country. Therefore, nails were generally designated by terms defining their use, as deck, scupper, pail, mop, hurdle, etc., or according to the forms of their heads, as clasp, rose, diamond, etc., or the shape of their points, as flat, sharp, spear, etc. Their thickness was expressed as fine, barbed and strong, and their length in inches, generally in connection with the weight (expressed in pounds) of 1,000 of the nails referred to. The principal forms of these old-time English nails are illustrated by the accompanying drawing and their uses may be briefly stated as follows: (1) "Rose-sharp" and "fine-rose": the former used for coopering, fencing and other rough work employing hard wood; the latter, with broad spreading heads of greater holding power, used in pine and other soft woods. (2) "Flat-point rose": used in wood liable to split by the wedge-like action of sharp-pointed nails. They were driven with the edges of their flat points across the grain of the wood and not only avoided splitting but also held more firmly. (3) "Clasp" nails: commonly used by carpenters in deal and similar woods. The edges of their heads projected downward and, when driven below the surface of the wood, held tightly by clasping a portion of it altogether, and also allowed a plane to pass over them in finishing work. (4) "Clout" nails, with flat circular heads and round sharp-pointed shanks: used in nailing iron-work and other substances to wood. (5) "Counter-clout" nails, with counter-

sinks under their heads, and chisel points: extensively used by wheelwrights and smiths. (6) "Fine-dog" and "strong-dog," with solid, slightly countersunk heads, round shanks and speared points: used for nailing down stout iron-work, in which the heads are not required to lie flush with the face of the metal. (7) "Kent-hurdle" and "Gate" nails, with broad thin rose heads, flat shanks and good spear-points: used for nailing together and clenching the oaken bars of hurdles, fences and gates. (8) "Rose-clench" nails, with points cut square: used in nailing wood-sheathing and the manufacture of packing cases and boxes, in which the soft wood is liable to split unless bored before being nailed. The square heads of the nails punch out their own holes by driving a portion of the wood before them. The term "clench" was derived from the mode of their employment in boat-building, where they were clenched by hammering down or by riveting the end over a "rove" (a diamond-shaped metal plate), thus drawing the planks together firmly. (9) "Horseshoe" nails, with square or countersunk heads: made of the best refined iron and capable of being drawn out fine without breaking in the hoof. (10) "Brads and tacks": a class of small very useful nails, employed for a variety of purposes too numerous to mention. The latter were sometimes made so small that 1,000 did not exceed 20 grains in weight. In the United States nails are designated as to kind as wrought, cut and wire nails; as to type by the purpose for which they are to be used, as lath nails, shingle nails, etc.; and as to surface, as smooth, barbed, etc. In sizes they range from the two-penny (2-d) to the sixty-penny (60-d) nails. Above these sizes they are called spikes; below them, brads. The smooth wire two-penny nails run almost exactly 1,000 to the pound; of larger sizes the count runs about as follows: three-penny, 600; four-penny, 300 to 450, according to gauge of wire; five-penny, 275 to 400; six-penny, 175 to 300; eight-penny, 100 to 150; 10-penny, 70 to 90; 12-penny, 65; 16-penny, 50; 20-penny, 30; 40-penny, 18; 60-penny, 11. Six-inch spikes run about nine to the pound and 12-inch spikes three to the pound. For many years nails have been marketed by the keg containing 100 pounds. Through the use of a recently developed packing machine, which, through the agency of magnetism, arranges the nails in parallel, nails are in the market in cardboard cartons from 10 pounds upward and in large quantities in wooden boxes which occupy only half the space required by the "keg" with its helter-skelter contents. The small nails or brads are usually packed in telescope containers, holding from one-quarter pound up to one pound.

The credit of inventing nail-making machinery appears to belong to the United States, a patent having been granted in 1786 to Ezekiel Reed, of Bridgewater, Mass., for a "cut-nail" machine. About the beginning of the 19th century nail-making machines had been generally introduced in England, but the first English patent was granted to John Clifford in 1790. In making cut nails strips of metal of a breadth and thickness corresponding to the length and thickness of the required nail and about a foot in length are heated to a black heat and fed into the machine end first. A slicer cuts off the

nail blank, which in falling is clutched at the neck and held until a moving die strikes its upper end and forms the head; it is then liberated and passes out into the trough. In small nails the taper of the shanks and points is obtained by cutting the nail blanks alternately, the metal strip (of uniform thickness) being turned over after each cut so that the points and heads are taken from the opposite sides of the blank; while in the larger nails the metal strip is rolled so that its cross section corresponds to the required taper. These machines turn out nails at a rate of 10 to 1,000 per minute, according to the size of the nails. Cast nails are produced by the ordinary process of molding in sand. They are relatively brittle, but are cheap, and are used for rough purposes, such as lathing and in the manufacture of stout boots and shoes. Wire nails were first made in France, hence sometimes called French nails. They were used in the woodworking trades and up to 1850 were made by hand. The wire was cut into the required lengths; a wire blank was pinched in a vise, with a small portion projecting, which was flattened into a head by a few blows of the hammer. Subsequently machines were invented into which the wire was fed and the cutting, heading, and pointing were performed automatically. In the United States William Hersel, of New York City, produced the first handmade wire nails in 1850. Shortly afterward French machines were imported, but they were soon superseded by those of American make.

NAIN SINGH, Pandit, Hindu explorer: b. Numaoon; d. Moradabad, United Provinces, Feb. 1, 1882. Employed as a surveyor for the government of India, during 1856-1857 he made exploratory surveys in Kashmir and Ladakh, but his chief title to fame rests on two secret journeys to Lhasa, capital of Tibet. Recording his observations on paper concealed in a prayer wheel, in 1865 he entered Tibet, from the United Provinces, near Lake Manasarowar, in Trans-Himalaya, and thence followed the course of the Tsangpo eastward to Lhasa, which he reached on Jan. 10, 1866; he remained in the city until April 21, 1867. In the second journey he set out by way of Ladakh, crossed the Tibetan plateau to Nam Tso (Tengri Nor), and from that lake went on to enter Lhasa on Nov. 18, 1874; an account of this second visit to the Tibetan capital, with map, was published in the *Geographical Magazine* (London 1876).

NAINSOOK, a soft muslin of Indian origin used for lingerie and underwear. Nainsooks are either plain or striped, the stripes running lengthways. In India nainsooks are sometimes made of silk. Nainsook is a Hindu word meaning "pleasure of the eye."

NAIRN, or **NAIRNSHIRE**, Scotland, a northeastern maritime county. It has about 10 miles of coastline on the Moray Firth; the land rises from the coastline to the south, attaining an altitude of 2,162 feet in Carn Glas; the area is 163 square miles. Agriculture and the raising of sheep are the principal industries of the people. The county town is Nairn, at the mouth of the river of the same name, 15 miles north-east of Inverness; it is a fishing center and vacation resort. Pop. (1931), county, 8,294; county town, 4,333.

NAIRNE, **Carolina** (nee **OLIPHANT**), BARONESS NAIRNE, Scottish ballad writer: b. Gask, Perthshire, Aug. 16, 1766; d. there, Oct. 26, 1845. Her father, Laurence Oliphant, was a staunch Jacobite and named her in honor of Prince Charles Edward, the Young Pretender. Her beauty and charm won for her the name of "The Flower of Strathearn." In 1792 appeared her first lyric, *The Pleuchman* (plowman), in the style of Robert Burns, and in 1798 she wrote her celebrated song of homesickness, *Land o' the Leal* (also known as *I'm Wearin' Awa'*). She was married in 1806 to William Murray Nairne, who became Baron Nairne in 1824; until his death in 1829 Baron Nairne was unaware of his wife's skill as a lyricist, for shyness led her to preserve a strict literary anonymity. Some of the nearly 100 songs which she wrote, many of them adaptations of old favorites, were first published anonymously in *The Scottish Minstrel* (1821-1824); she signed the ballads "B. B." (for "Mrs. Bogan of Bogan"). Her best known songs included *The Laird o' Cockpen*, *The Hundred Pipers*, *Charlie is My Darling*, *Will Ye No Come Back Again?*

NAIROBI, nī-rō'bē, British East Africa, capital of Kenya Colony, 330 miles northwest of Mombasa. Located on the Athi plains, at the foot of the Kikuyu hills, it is 5,452 feet above sea level. The site was selected in 1899 as headquarters of the Uganda Railway, then under construction, and when white settlement of the country's highlands commenced early in the 20th century, Nairobi expanded as an important commercial center. The town replaced Mombasa as capital in 1907. Neither too hot nor too cold, the climate is generally delightful; rain usually falls during each month, the total annual rainfall averaging 38.07 inches. Pop. 65,000.

NAIVASHA, nī-vā'shā, Kenya Colony, British East Africa, town on a lake of the same name, 65 miles northwest of Nairobi. It lies in the midst of a rich agricultural region at an elevation of 6,231 feet above sea level. The Uganda Railway, from Mombasa, skirts the eastern shore of Lake Naivasha. Discovered in 1883 by Gustav Adolf Fischer (1848-1886), this fresh water lake, 12 miles long and 9 miles wide, is fed by two rivers but has no known outlet; it is the haunt of millions of flamingoes.

NAJARA, nā-jā'rā, Israel ben Moses, Hebrew poet and liturgist: b. Damascus, Syria, 1530?-1599. His secular poems were inspired by a remarkable mysticism, and his religious hymns, deeply emotional, were frequently set to tunes of Arabic or Turkish origin, hitherto used for light themes. Some of his hymns, dirges, and prayers for holy days were included in Jewish prayerbooks, especially in Italy and Palestine. In 1587 he published a collection of his poems under the title *Zemiroth Yisrael* (Songs of Israel).

NAKED BAT, strangest of all chiroptera is the *chiromela torquatus* or collared bat of the Malayan region. It measures five and one-quarter inches in length exclusive of the tail and has 26 teeth. Except the collar of thinly-spread hairs surrounding the neck the puckered skin is practically naked. Its muzzle is long and piglike but the most curious characteristic

of this repulsive creature is the deep pouch on the underside of the body below the arm-pits existing in both sexes and holding the young while suckling. These strange creatures are found on the islands of Java, Sumatra and Borneo in dense forests where they repose till the sun reaches the horizon.

NAKONG, nă-kōng, one of the four species of harnessed African antelopes. It inhabits the swamps of Central and South Africa and East Africa and is known also as the sititunga (*Tragelaphus spekei*). This species has the distinction of having a perfectly uniform grayish brown color, while the young are faintly striped and spotted, the hair being more silky and longer than the others; the horns, forming nearly two complete turns, are smooth, slender and strongly ridged. The male stands about three foot seven inches. They go in pairs never in herds. They are highly prized by the natives as game.

NAKSHATRA (Sanskrit, "Celestial luminary" or "star"), in the Vedas simply means a star, but later was used of what in the mythological astronomy of India are called mansions of the moon, in which that planet periodically rests in its course through the heavens; these were small clusters of stars or asterisms, 27 or 28 in number. They were mythologically personified as the daughters of Daksha, wives of the moon. Their introduction into the Hindu system has been variously accounted for. Consult Thibaut, G., 'Astronomie, Astrologie und Mathematik'; 'Grundriss der Indo-Arischen Philologie und Altertumskunde' (Strassburg 1899).

NAKSKOV, năk'skôv, Denmark, seaport town on the west coast of the island of Laaland, on Nakskov Fiord and on the Nykjøbing-Nakskov Railway. Its chief industries are the manufacture of sugar and machines, a trade in grain, besides its ship-building and shipping. It was once fortified and was captured by the Swedes in 1658. Its inhabitants number about 10,000.

NALA, nă'la, in Hindu mythology, a legendary king of ancient India, whose love for Damayanti, the daughter of Bhima, king of Vidarbha, and the adventures arising therefrom, forms a celebrated episode of the 'Mahābhārata' (q.v.), as also of a separate poem, the 'Nalodaya,' attributed to Kalidasa. Consult Macdonell, A. A., 'A History of Sanskrit Literature' (London 1900).

NALTUNNETUNNE (năl-tū-nă'tū-nă') **INDIANS**, an American tribe of the Athapascan family, formerly residing on the Pacific Coast south of Rogue River, in southwest Oregon, between the Tututni on the north and the Chetco on the south. They had no separate villages, and spoke a dialectic variation of the Tututni language. Their tribal name signifies "people among the mushrooms." A few descendants of the race now live on the Siletz reservation, Oregon.

NAMALAND. See SOUTH WEST AFRICA.

NAMANGAN, nă-măn-găn', Russian Turkestan, a town of Ferghana, on the Sir-Daria, near the confluence of the Narin, about 50 miles northeast of Khokand. It is in a rich oasis, and is the trading centre for the surrounding nomadic tribes. Near it naphtha and coal are

found. The principal industries are soap and leather manufactures. Pop. 78,942.

NAMAQUALAND. See SOUTH WEST AFRICA.

NAMAS. See HOTTENTOTS.

NAMAYCUSH, the great lake-trout (q.v.).

NAMES of persons in the very earliest ages no doubt had some significance and meaning, but no record is handed down to us. The Old Testament names are almost all original, that is, given in the first instance to the individual bearing them, and either originated in some circumstance of birth as an expression of some religious sentiment, thus—Jacob (supplanter), Isaac (laughter), Isaiah (salvation of Jehovah), etc. The names of women had equal significance: Rachel (ewe), Hannah (favor), Deborah (bee), etc. In Old Testament times the name was often changed on the occasion of an important event in one's life, Abram becoming Abraham, Jacob becoming Israel, and so on. Neither the Hebrews, Egyptians, Assyrians, Babylonians, Persians nor Greeks had surnames; and in the earliest period of their history the same may be said of the Romans. In course of time, however, every Roman citizen had three, the prænomen or personal name, which was placed first, and commonly written with one or two letters, for example C. for Gaius, Cn. for Gneius, M. for Marcus, Q. for Quintus, and so on. Then followed the nomen, the name of the gens or clan, as Cornelius, Julius, Fabius, from the Cornelian, Julian and Fabian gentes. Lastly came the cognomen or family name, as Cicero, Cæsar, Scipio, etc. Conquerors were occasionally complimented by the addition of a fourth name or agnomen, commemorative of their conquests, as Coriolanus, Africanus, Germanicus, etc. While the earliest Greek names were expressive of some quality in high estimation, as Callimachus (excellent fighter), Apollodorus (gift of Apollo), the Roman names were less dignified and ambitious in their origin; thus Porcius (swineherd), Cicero (vetch grower); some from personal peculiarities, as Naso (longnosed), Paulus (little), Crassus (fat), Cæcilius (one-eyed). Celtic and Teutonic names had often equal significance, as Gottfried (God's peace), Conrad (bold in counsel), Bertha (brightness), Ethel (noble), etc. Times of great public excitement have had very considerable influence in modifying the fashion in names. Thus the English Puritans preferred Old Testament names and such as directly expressed religious sentiment. Among the Scottish Covenanters Old Testament names were also prevalent. At the French Revolution the names of the most famous Greek and Roman republican heroes were in general favor. Among primitive races, names of familiar objects were first given to clans, local groups, and finally very loosely to individuals.

The principal of the modern system of personal nomenclature now adopted in most countries in Europe is to have one name for the individual (Christian or baptismal name) joined to a second name which is common to the family to which he belongs (surname). It is impossible to state with any degree of certainty when this system became general. No instance is known, we believe, of any Anglo-Saxon family bearing a surname from generation to gen-

eration. They were introduced by the Norman adventurers, but were for centuries confined to the upper classes. Surnames became general in Scotland about the 12th century.

The principal sources from which surnames are derived are the following:

Personal characteristics: Black, Brown, Grey, Green, Whyte; Little, Long, Short, Broadhead, Lightfoot, Cruickshank.

Rank or profession: King, Prince, Pope, Bishop, Abbot, Prior, Stewart or Stuart, Smith, Wright, Carpenter, Taylor, Baker or Baxter, Weaver or Webster, Falconer, Fletcher (arrow maker), Glover, Bowman, Chapman or Marchant, Miller, Brewer or Brewster, Shepherd.

Localities, animals, or natural objects: Hill, Dale, Wood, Forest, Brookes or Burns, Grove, Shaw; Bird, Lyon, Hogg, Crabbe, Fox, Roe-buck, Bull; Stone, Tree, Flint, Steele.

Patronymics: Andrews, Anderson, Alexander, Sanderson, Sandison; James, Jameson, Jamieson; Jones, Johnson, Jonson, Jackson; Williams, Williamson, Wills, Wilson; Thom, Thomson; Roberts, Robertson, Robinson.

Surnames in many other languages are derived from like sources: thus Black, White, and Brown in German become Schwartz, Weiss, Braun; in French, Lenoir, Leblanc, Lebrun.

In the matter of *prefixes and suffixes*, the Gaelic prefix Mac, the Irish O', the Norman-French Fitz, the German suffix -shon or -son, the Scandinavian -sen, and the Russian -vitch are all equivalents of the English -son.

The Hebrews, as already stated, had no surnames proper, nor had the Arabians; but to distinguish two men of the same name, the Hebrews used the form *ben* (Solomon ben David, meaning son of David), and the Arabians used *ibn* (Abraham ibn Ezra, or son of Ezra). The Welsh used the word *ap* in the same way (Evan ap Richard, meaning John son of Richard).

In most nations, a woman upon marrying changes her surname to that of her husband. In Spain, however, she retains it, while the son may adopt either the paternal or maternal name.

In Great Britain a man may change his Christian name and surname without an act of Parliament, royal license, or even public advertisement; but there is no law to compel third parties to use the new name. In the United States names can be changed only by courts of record.

Nicknames.—It is most difficult to classify nicknames of persons owing to the great variety of origins. Some of the chief sources from which they are derived are the following:

Physical peculiarities, complimentary or derogatory terms: Strongitharm, Spindleshanks, Sheepshanks, Crookshanks, Heavisides.

Mental attributes: Grave, Stern, Wise, Sage, Moody, Proud, Courteous or Curteis; Blythe, Gay, Foolhardy, Jolly, Meek.

Complexion and color of hair: Black, White, Brown, Browning, Ruddy, Readman, Hoare, Grey.

Peculiarities of dress; social position: Curtmantle, Shorthose; Bastard, Lacklands.

Animal and vegetable kingdom: Bird, Fish, Fox, Wolfe, Bean.

Compounds are made by applying a sobriquet to a Christian name; for example: Micklejohn, Littlejohn, Properjohn. These names appear again in Norman guise as Grosjean, Petijean, and Bonjean; from the latter comes Bunyan, so that when we speak of "good John Bunyan" we are

(perhaps unconsciously) only translating the name. See also NICKNAMES, NATIONAL AND POPULAR.

Consult Weekly, E., *Romance of Names and Surnames* (New York 1922); Withycombe, E. G., *Oxford Dictionary of English Christian Names* (New York 1943).

NAMOUNA, nā-mōō-nā', in Persian mythology, an ever young and beautiful enchantress, born long before any other created thing, yet still retaining all her youthful attractiveness. The idea probably originated in the observation of the changes of nature, the dying of vegetation and its renewal. The same conception has been held concerning the moon for the same reason.

Among various American Indian tribes a very similar myth prevailed. The Navajos personified nature in their goddess Estsánatlehi, "the woman who rejuvenates herself." When she grows to be an old woman she becomes a young girl again. She is always changing but she never dies. She was the mother of the twin war gods by the sun. These sons destroyed the alien gods and bad spirits, and aided the sick suffering from witchcraft. The power of her two sons over witchcraft would seem to connect Estsánatlehi with the moon and also with the sun of whom the moon is generally the wife.

NAMPA, nām'pā, city, Idaho, in Canyon County; altitude 2,480 feet; 18 miles west of Boise; on the Union Pacific Railroad. Located in an irrigated area, its chief industries are the processing of dairy products and sugar beets. There are also seed and storage plants and railroad shops. Nazarene College is located here and there is a state institution for the feeble-minded. Nampa was incorporated in 1890. Pop. (1930) 8,206; (1940) 12,149; (1950) 16,185.

NAMUR, nā-mōōr'; Fr. nā-mür' (Flem. NAMEN), city, Belgium, capital of the Province of Namur, located at the confluence of the Sambre and Meuse rivers, 35 miles southeast of Brussels. Of its old fortifications only a picturesque citadel remains, now surrounded by a park and playground. The town is strategically situated and well-built, with spacious streets and several handsome squares. Among its most notable buildings is the 18th century Cathedral of St. Aubain, the archaeological and forestry museums, and public library. —The city is famous for its manufacture of fine cutlery and it possesses important leather works and iron and brass foundries. Its trade since early ages had been greatly favored by the two navigable rivers, and as the junction of five main railways it has direct communication with Brussels, Mons, and the French frontier.

Namur dates from the 7th century, under the various names of Namucum, Navinucum, Castum, and Namon. It was taken by Louis XIV in 1692 and retaken by William III of England in 1695. In August 1914 it was occupied by the Germans and again during World War II it suffered great damage. Pop. (1948 est.) 31,637.

NAMUR PROVINCE is bounded on the north by Brabant Province, on the northeast by Liège, on the east by Luxembourg Province, on the south and southwest by France, and on the west by Hainaut. The greatest length, north to south, is 57 miles; the greatest breadth, 37 miles; the total area is 1,413 square miles. The surface

is greatly diversified, well watered by the Meuse, with its tributaries, the Lesse and the Sambre. About one half of the whole surface is cultivated. The chief vegetable productions are the ordinary cereals, oilseeds, chicory, fruit, and medicinal and dye plants. In some places the vine is cultivated. The extensive forests furnish good timber and the prevailing carboniferous strata yield coal, iron, limestone, etc. The industry of the province, both manufacturing and commercial, is largely developed. Namur was an independent country as early as the 10th century. At the close of the 12th century it came into the possession of the counts of Hainaut, and early in the 13th century fell to Peter of Courtenay, emperor of Constantinople. It was sold by his son Baldwin to Guy of Dampierre, count of Flanders, with whose descendants it remained till 1420, when it was purchased by Philip the Good, duke of Burgundy, for 132,000 gold ducats, and afterward shared the fate of the other Burgundian states. Pop. (1944 est.) 350,529, nearly all of whom speak the Walloon dialect. See WAR, EUROPEAN.

NANA, a novel by Emile Zola published in 1879, the ninth in a series of 20 related novels issued, 1871-1893, under the general title, *Les Rougon Macquart*. Nana, the beautiful daughter of the drunkard Coupeau and the laundress Germaine (characters in *L'Assommoir*, another of the series) becomes mistress of a shady banker, and next of an actor who beats and finally deserts her. Embittered by these early disappointments in her courtesan career, Nana determines thenceforth to ruin all her lovers. Her victims include a captain who steals from his regimental funds for her, and his brother who commits suicide. In the end she suffers a horrible death in a hotel bedroom. A brutal but powerful story, its implicit theme is the vengeance of the common people meted out to their aristocratic oppressors.

NANAIMO, nā-ni'mō, Canada, a city of the Province of British Columbia, situated on the east coast of Vancouver Island two or three miles south of Departure Bay, and opposite the city of Vancouver on the mainland. Steamers ply daily between the two cities. It is approximately 65 miles northwest of the city of Victoria, with which it is connected by the Esquimalt and Nanaimo Railway. There are coal mines and large sawmills in the vicinity, and coal and lumber are exported. Nanaimo is the distributing center for practically the whole of Vancouver Island north of Victoria, and is the headquarters of Vancouver Island Union Library. Pop. (1941) 6,635.

NANAK, nā'nāk, **NANEK**, or **NANUK**, Hindu religious leader, founder of the sect of the Sikhs: b. Talwandi (now Nankana), in Lahore, 1469; d. Kirtipur, 1538. A member of the warrior caste, he early associated with Kabir leader of a monotheistic sect, and came under other mystical influences. He traveled to all the holy places of India, made the pilgrimage to Mecca and Medina, and as a result of his studies of Brahmanism and Islam wrote the *Adigranth*, which frequently quotes Kabir, and in general is a mixture of the Vedas and the Koran. This gospel he preached through India; it became the national religion of the Sikhs and was proclaimed by Nanak's successors from Labana down to Govind Singh, who died in 1708. The *Adigranth*

preaches the worship of one god, the equality of man, the duty of loving all men, and the need for frequent ablution. See SIKHS.

NANA SAHIB, nā'nā sā'hīb, real name DANDHU PANTH (dūn'dōn pūnt') Maratha leader of the Sepoy Rebellion: b. near Cawnpore, 1825; d. Nepal, about 1859. He was the adopted son of the last Maratha peshwa of Poona, whose great wealth he inherited, but whose annual pension of about \$400,000 was not continued to him by the British government. He lived as a native prince, moving in European society, and when the Sepoy mutiny broke out he secretly encouraged it, but openly offered aid to the English. He marched on Delhi at the head of native troops; promised the English a safe conduct from Cawnpore, but shot or drowned all of them but four; and before leaving the city killed all Europeans, women and children included, that he found in the city and threw their bodies into the famous well of Cawnpore. He fled to Nepal, was repeatedly defeated by the English, who ultimately drove him out of the English province into the jungle, and was not heard of after 1859. Consult Landon, P., *Under the Sun, Impressions of Indian Cities with a Chapter Dealing with the Later Life of Nana Sahib* (London 1906); Burgess, J., *The Chronology of Modern India, 1494-1894* (Edinburgh 1913).

NANCHANG, nān'chāng', capital of Kiangsi Province, China, on the Kan River, near Lake Poyang. Linked by rail with Nanking, Hankow, Canton, and Hangchow, it is noted for its porcelain. Pop. (official est. 1945-1946) 203,101.

NANCREDE, C(harles) B(cylard) Guérard de, American surgeon: b. Philadelphia, Pa., Dec. 30, 1847; d. Ann Arbor, Mich., April 12, 1921. Educated at the University of Pennsylvania and at Jefferson Medical College, he practiced in Philadelphia; and after 1889 was professor of surgery and clinical surgery and surgeon of the university hospital at the University of Michigan, retiring in 1913. In the Spanish American War he served as surgeon at the front; and in 1908-1909 was president of the American Surgical Association. He wrote *Essentials of Anatomy* (1888), and *Lectures upon the Principles of Surgery* (1899); and contributed to various reference works, including the *International Encyclopedia of Surgery* (1881-95), *Wood's Reference Handbook of the Medical Sciences* (1887), *Cyclopedia of the Diseases of Children* (1890), C. H. Burnett's *System of Diseases of the Ear, Nose, and Throat* (1893); and F. S. Dennis' and J. S. Billings' *System of Surgery* (1895).

NANCY (Fr. nōn-sē), France, the capital of ancient Lorraine, of the former department of Meurthe and since 1872 of the department of Meurthe-et-Moselle, situated in a fertile plain, near the left bank of the Meurthe, 218 miles east of Paris, on the railway to Strasbourg. It is divided into the old and the new town, has extensive suburbs and is strongly defended by isolated *forts d'arrêt*. The old town is irregularly built, with streets narrow and winding; but has several fine public buildings. The new town has straight and spacious streets, intersecting each other at right angles, and traversed by tramways; the houses, almost without exception, are handsome. The Place Stan-

islas, surrounded by several fine public buildings, and communicating, by a triumphal arch, with the Place Carrière, has a fine statue of Stanislas Leszczynski, king of Poland, who passed the latter years of his life here as duke of Lorraine and bestowed upon the town many of its finest modern embellishments. There are statues also to General Antoine Drouot, Louis Thiers and other notabilities. The Cours Léopold, occupying the highest part of the town, and finely planted, is the principal promenade; another is the Pépinière, a large planted area. Among the chief edifices are the cathedral, a modern structure in the Italian style; the church of Saint Epyre, with a lofty tower and a fine portal, one of the finest specimens of modern Gothic in France; the church of the Cordeliers, built in 1484, and containing the tombs of several dukes of Lorraine; the 19th century churches of Saint Peter, Saint Vincent and Saint Leon; Hôtel de Ville (17th century); ducal palace, an elegant specimen of flamboyant Gothic, with a fine porch (16th century); public library; seven handsome gates or triumphal arches. Nancy is the see of a bishop and the headquarters of the 20th Army Corps. At the head of its educational institutions is the celebrated university founded at Pont-à-Mousson in 1572 and removed to Nancy in 1768; it has faculties of law, philosophy, natural science, mathematics, medicine and a school of pharmacy; Nancy also has a lyceum, a botanical garden, a school of forestry, and a theological seminary. The manufactures consist of broadcloth and other woolen stuffs; cotton and cotton yarn, hosiery, lace, all kinds of embroidery, stained paper, and tobacco. There are also ironworks, dyeworks, breweries and tanneries. In a battle fought under its walls, the duke of Burgundy (Charles the Bold) was defeated and slain by René II, duke of Lorraine, in 1477. On Aug. 12, 1870 it surrendered to the Germans, by whom it was occupied until Aug. 1, 1873. The population was largely increased by the influx of Alsations after the annexation of Alsace to Germany. During World War I Nancy was an important railway center, and as such was frequently under the fire of German artillery and aircraft. An attack made in 1914 was repulsed, and the city remained in French hands during the war. It suffered some damage from shelling by "Big Bertha" and from German bombing. Under German occupation during World War II from June 1940, it was subjected to heavy Allied bombing. Pop. (1936) 121,301.

NANDUS, a Brazilian name for the South American ostrich or rhea. See **RHEA**.

NANEK, or **NANUK**. See **NANAK**.

NANINI, nā-nē'nē, or **NANINO**, nā-nē'nō, Giovanni Maria, Italian composer: b. Tivoli, c. 1545; d. Rome, March 11, 1607. A pupil of Palestrina, he opened, in Rome, the first Italian public school of music there. He was appointed Maestro di Cappella at Santa Maria Maggiore in 1571. In 1577 he became a member of the Pontifical Choir, and in 1604 maestro of the Sistine Chapel. His compositions are of great value; among them are *Hodie nobis Coelorum Rex*; *Cento cinquante sette Contrappunti e Canoni*. His manuscript works are preserved

in the private collections of the Sistine Chapel and the Vatican Library. His published compositions take various forms: motets, madrigals, canzonets as well as church music. They are of the Palestrina period. Consult Radicotti, G., *Giovanni Maria Nanini* (Pesaro 1906).

NANKEEN, or **NANKING CLOTH**, a cotton cloth originally manufactured in Nanking. It was imitated in other cotton-producing countries, and has been largely superseded.

NANKING, capital of China, is on the south bank of the lower Yangtze River, about 160 miles from Shanghai. It is about 20 miles in circumference, and is surrounded by a high wall, sections of which were torn down after Nanking became the national capital in 1927. The city and its surroundings are notable for green hills, winding streams, and charming lakes. The principal streets are of moderate width, clean, well-paved, and lined with handsome stores. There are many modern buildings, but most of the houses are only one story high. There are extensive manufactures of fine satin, crepe, and nankeen, the cotton cloth which derives its name from the city. Many modern industries built in and around Nanking since it became China's capital were destroyed when the Japanese captured the city in December 1937. The National University, Ginling College for Women, the University of Nanking, and other schools, with their students and faculties, left Nanking before its capture. When the Japanese armies entered the city they carried out a systematic murdering of Chinese civilians, raping of women, and burning of property. After Japan's surrender the personnel of the cultural and educational institutions of Nanking returned there.

Nanking has long been an important political center. It was the capital of China during several dynasties, including the early Ming period, the Ming emperors subsequently moving their capital to Peking. In 1853 the Taiping rebels proclaimed the Taiping Heavenly State there. When the Chinese Republic was first proclaimed it had its seat in Nanking. Before the Nationalists established their capital there in 1927 it was the capital of Kiang-su Province. After occupying Nanking the Japanese set up a puppet regime there called the Reformed Government of the Republic of China, which collapsed after Japan's surrender. —On September 9, 1945, China formally took over the city from the Japanese, and on May 5, 1946, the national government formally returned to Nanking. Pop. (est. 1945–1946) 856,364.

NANNA, nān'nā, in Scandinavian mythology, the wife of Balder and the goddess of immaculate purity. Her name means "blossom" and she was the daughter of Nip, which means "bud," and a goddess. In the myth of the *Death of Balder the Beautiful*, his wife, Nanna, falls dead by the side of the corpse of her husband and is placed upon the bier with him that she may accompany her beloved even in death. When Hermod visited the land of the dead to gain the freedom of his brother, he found Nanna ministering to him as he lay sick and pale on a couch. Balder wished Hermod to take Nanna back with him; but she refused to leave her husband. Balder is the personification of life-giving light and his wife.

Nanna, is the personification of vegetation which dies when the great light giver, the sun, goes on his winter journey to the south. Balder is generally called the radiant god of sunshine; and his wife, like the classical Proserpina, goes down into the underworld.

NANNING (YUNGNING), an important city in southwest Kwangsi Province, China, is on the north bank of the Yukiang, chief southern tributary of the Sikiang. Linked by rail with French Indochina and by road and river with Kweilin, capital of Kwangsi, and with Canton, it is a trading center for rice, hemp, tobacco, and cotton cloth. Pop. (official est. 1945-1946) 409,613.

NANSEN, Fridtjof, frēt'yōf nān'sēn, Norwegian Arctic explorer, zoologist, statesman, and humanitarian: b. Frøen, Norway, Oct. 10, 1861; d. Oslo, May 13, 1930. He studied zoology at the University of Christiania (now Oslo), and in 1882 made an Arctic voyage in a sealing vessel on the purpose of studying animal life in the higher latitudes. On his return he was appointed curator of the Museum of Natural History, Bergen. In 1888, he led an expedition across Greenland a little north of latitude 64°N., an account of this journey being published in England in 1891, under the title *Across Greenland*. He returned to Norway the following year and was appointed curator of the Museum of Comparative Anatomy at the University of Christiania. In 1893, he sailed aboard a specially built steamer, the *Fram*, in the expectation that, entering the polar ice in the neighborhood of the New Siberian Islands, the ship would drift eastward south of the pole and come out on the east side of Greenland. This expectation was based on the fact that articles belonging to the *Jeannette*, an Arctic expedition vessel lost in 1881 (see JEANNETTE EXPEDITION), had drifted in about three years from Bering Strait across the polar regions to Greenland. After being carried to latitude 83°59'N., he left the *Fram* and, with a single companion, Lieut. E. H. Johansen, took to the ice, equipped with sledges, dogs, and kayaks. In this way he reached a higher latitude than any previously attained, 86°14'N. (April 8, 1895), and then turned southward to Franz Josef Land (now Fridtjof Nansen Land), where he spent the winter of 1895-1896. On June 17, 1896, he fell in with members of the Jackson-Harmsworth Expedition (see JACKSON, FREDERICK GEORGE), with whom he returned by ship to Vardö, Norway. The *Fram* (under Capt. O. N. Sverdrup), which had reached latitude 85°57'N., arrived in Norway eight days later via the west coast of Spitzbergen (Svalbard). Numerous honors were conferred upon Nansen, including a professorship of zoology at the University of Christiania. In 1900, he joined an expedition to explore the North Atlantic, and in the following year became director of the International Commission for Study of the Sea. He was strongly favorable to the separation of Norway from Sweden (1905), and served as the first Norwegian minister to Great Britain (1906-1908). He resigned his diplomatic post in 1908 to become professor of oceanography at the University of Christiania. Between 1910 and 1914, he made four oceanographic expeditions in the North Atlantic and Arctic oceans. At the close of World War I, he was placed in charge of the repatriation of about 500,000 prisoners of

war from Siberia, China, and other parts of the world. Under the sponsorship of 12 governments and 48 national Red Cross societies, he directed the administration of relief to sufferers from famine in Russia (1921-1923). He also served as League of Nations high commissioner for relief work among Russian, Armenian, and Greek refugees. For these activities, he was awarded the Nobel Peace Prize for 1921-1922. A strong supporter of the League of Nations, Nansen subsequently served as Norwegian delegate to the League. In 1925, he was chosen rector of St. Andrews University, Scotland. Among his published works are *Eskimo Life* (1891), *Farthest North* (1897), *Norway and the Union with Sweden* (1905), *Through Siberia* (1914), *Armenia and the Near East* (1928), and numerous scientific books, including reports of his various expeditions.

NANSEN, Hans, Danish statesman: b. Flensburg, Schleswig-Holstein, Nov. 28, 1598; d. Copenhagen (Köbenhavn), Nov. 12, 1667. As mayor of Copenhagen, Nansen was the leader of the antiaristocratic party whose influence resulted in the abolition of the privileges of the nobility and the institution by Frederick III of the absolute monarchy in Denmark (1660).

NANTERRE, nān-tār', France, town in the Department of Seine, located at the foot of Mount Valérien, eight miles west of Paris. Its chief industry is the manufacture of chemicals. It is the traditional birthplace of St. Geneviève (q.v.), patron of Paris. Pop. (1946) 41,860.

NANTES, nānt, France, capital of the Department of Loire-Inférieure and an important commercial port, situated on the right bank of the Loire at its confluence with the Erdre, 248 miles by rail west-southwest of Paris. The usefulness of the port was enhanced by the construction of a ship canal in 1891 to St. Nazaire, 40 miles to the west at the mouth of the Loire, and by extensive harbor improvements undertaken after 1914. The city is the see of a bishop; it has courts of first resort and of commerce, a chamber of commerce and an exchange, a college, a seminary, a secondary ecclesiastical school, a secondary school of medicine, and a hydrographic school. Among its products are blankets, textiles, ship machinery and supplies, cordage, chemicals, glue, and various food products, including biscuits, sugar, sardines, and preserved meats. There are also cotton mills, iron works, glass works, and important shipbuilding docks. Nantes carries on an extensive trade with the French Union and with foreign countries. Among the more interesting public buildings are the cathedral, in flamboyant Gothic style, which was begun in the 15th century and completed in the 19th; the ducal castle, which dates back to the 9th or 10th century and was rebuilt in the 15th century, flanked with massive round towers; the Palais des Beaux Arts (1900), which contains a fine collection of paintings.

Before the conquest of Gaul by the Romans, Nantes was the principal town of the Namnetes, a leading Gallic tribe of Brittany. During the 9th century it was thrice taken by Norse raiders and almost entirely ruined. In 1118, when it had again become prosperous, a fire reduced the greater part of the town to ashes. During the Hundred Years' War, it suffered much, repeatedly falling into the hands of the opposite parties. For a long time it formed one of the most valuable

possessions of the dukes of Brittany, but in 1499 the heiress of the dukedom, Anne of Brittany, who was born here, having married Louis XII, it passed with the rest of her possessions to the Crown of France. The most memorable event connected with the history of Nantes is the famous edict (see **EDICT OF NANTES**) issued by Henry IV, April 30, 1598, securing the Protestants in the free exercise of their religion, and making them eligible to all civil and military employments. This edict was revoked by Louis XIV in 1685. The *noyades* or drownings of the monster Jean Baptiste Carrier (q.v.) during the revolution were perpetrated here. Pop. (1946) 195,185.

NANTES, Edict of. See **EDICT OF NANTES**.

NANTEUIL, nan-tù'y, **Robert**, French copperplate engraver: b. Reims, 1623; d. Paris, 1678. His father-in-law, Nicolas Regnesson, was his first instructor and in 1647 he went to Paris and worked under the eye of Philippe de Champaigne (q.v.). Louis XIV appointed him designer and engraver to the king. He employed in his work a simple line which grew gradually thicker at the shade point and died away toward the high light in faint and fainter stipple points; in this way he produced the fine color values which characterize his engravings. In his portraits, of which about 200 exist, he exhibits powerful modeling and lifelike drawing. They include portraits of Louis XIV, Anne of Austria, Madame de Sévigné and other renowned persons. Some of these latter works are after the paintings of Charles Lebrun. He also executed some excellent pastels.

NANTICOKE, nān'ti-kōk (Nentigo, "tide-water people"), a former American Indian tribe of the Algonquian family residing, when first discovered by the whites, on the east shore of the Nanticoke River, where their principal village, also called Nanticoke, was situated in 1608. Their language was very closely related to that of the Delaware. They were great fishers, trappers and hunters and according to tradition they had, at an earlier period in their history, gone southward in search of game, when their old hunting grounds had become too densely populated for a nomadic race. Tradition also says that a league existed between the Nanticoke and other tribes covering a large extent of territory, for many generations. Already in 1642 the Nanticoke had been declared enemies of the Maryland colony; but in 1678 a treaty was made with them; and 20 years later reservations were set apart for them. About 1725 they began to move northward gradually, going up the Susquehanna and finally settling at Oswego, Chenango and Chugnut in the State of New York. A part of the tribe, however, under the name of Wiwash, remained behind in Maryland. Some of those in New York State amalgamated with the Iroquois; but most of them, feeling the pressure of civilization, went west into Ohio and Indiana and there joined the Delawares about 1784.

Among all the neighboring tribes the Nanticoke Indians had the reputation of being great magicians; and they were greatly feared on this account. A head chief ruled over all the villages, thus binding together the interests of the tribe or tribes composing the Nanticoke people. Apparently this chief was sometimes a woman.

They fortified their towns against the enemy. In the "Nanticoke Confederacy" were included the Nanticoke proper, Arseek, Cuscarawac, Nause and Sarapinagh and perhaps Ozinies and other sub-tribes. In southern Delaware there are still numerous half-breed Nanticoke.

NANTICOKE, city, Pennsylvania, in Luzerne County; altitude 538 feet; on the Susquehanna River; 7 miles southwest of Wilkes-Barre; on the Central of New Jersey and Pennsylvania railroads. Nanticoke is a coal producing center, situated in one of the richest anthracite coal regions in the world. A large portion of Pennsylvania's anthracite is taken from the Luzerne deposits. In addition to the mining of coal, its principal industry, there are manufactures of silk and rayon yarns, cigars, and mining and foundry equipment. Nanticoke Falls furnish the water power for local mills and factories. The city is a wholesale and retail trading center for several smaller municipalities near by. Across the Susquehanna from Nanticoke is the village of West Nanticoke, near which is the only tract of land still in the possession of descendants of William Penn. The property, on Tillsbury Knob (a high, cone-shaped brownstone hill), is a part of the original land grant. The land on which Nanticoke is built was once occupied by a Nanticoke Indian village. Surveyed and platted in 1793, Nanticoke was incorporated as a borough in 1874; in 1926 it was granted the city charter under which it now operates. The government is administered by a mayor and council. Pop. (1950) 20,160.

NANTUCKET ISLAND, Massachusetts, is situated about 25 miles south of Cape Cod across Nantucket Sound. To the west Muskeget Channel separates it from Martha's Vineyard. Extending 14 miles in an east-west direction, Nantucket with two small islands off its western extremity Muskeget and Tuckernuck, constitute Nantucket County, area 46 square miles; the county and Nantucket town are coextensive. The village of Nantucket, located on a good harbor on the north shore, is the county seat and chief trading center. It has steamer connections with Wood's Hole or Cape Cod.

The town has a public library (the Athenaeum), the Jethro Coffin house (1686), an old mill, and a fine whaling museum. Its historic houses built by whaling captains from the profits of voyages to the Pacific islands and the Orient, its Old New England atmosphere, and natural advantages for boating and bathing have made it a popular summer resort and artists' colony. Smaller communities on the island are Siasconset (skōn'sit) on the east coast, Wauwinet, Quidnet and Squam Head.

Visited by Bartholomew Gosnold in 1602, it was first settled in 1659 at a place called Madaget by families from Salisbury, Mass., led by Thomas Macy, and was long a center of Quaker influence. The town was incorporated in 1687 and the county formed in 1695. In the 18th century it became a famous whaling port, and it continued center of the industry until the mid-19th century. There are regular town meetings and officials are elected annually. Pop. (1950): village, 2,901; town, 3,484.

NAON, nā-ōn', **Rómulo S.**, Argentine diplomat: b. Buenos Aires, Feb. 17, 1876; d. the

Dec. 30, 1941. He studied at the University of Buenos Aires and later became professor of philosophy at the Colegio Nacional de Buenos Aires, then professor of constitutional law and member of the directive council faculty of law and social sciences. He entered political life (1902) as representative of the National Congress and was re-elected (1906), becoming minister of justice and public instruction (1908). He was (1910-1914) envoy extraordinary and minister plenipotentiary to the United States and in the latter year became the first ambassador of Argentina to the United States. He was re-elected (1912) to the National Congress but resigned to remain with the United States. In 1917 he resigned his office because his country's government refused to declare war against Germany. He served as general secretary of the Argentina delegation to the second Hague Peace Conference, was a member of the A.B.C. (Argentine-Brazil-Chile) Peace Conference (1914) at Niagara Falls, to avoid war between the United States and Mexico, a delegate at the Pan American Conference (1915). For his services he was awarded numerous decorations. He wrote several works on political science and constitutional law, and received the honorary degree of LL.D. from Pittsburgh, Yale, Harvard and Brown universities.

NAOROJI, nou-rō'jē, **Dadabhai**, first Indian member of the British Parliament; b. Bombay, Sept. 4, 1825; d. July 2, 1917. The son of a Parsi priest, he was educated in the Bombay school, later the Elphinstone School and College, where he was the first native professor of mathematics and natural philosophy (1854). In 1855 he went to England, where he afterwards, for the most part, resided. In 1867 he assisted in founding the East India Association; through his efforts in 1870 the civil service was opened to native Indians; and he accomplished much for the improvement of Indian finance and industries. He became prime minister to the prince of Baroda (1874); from 1875 to 1887 he held important municipal and legislative positions; and in 1886 and 1893 was president of the Indian National Congress. For many years he was president of the London Indian Society. From 1892 to 1895, as a Liberal, he represented Central Finsbury in the House of Commons, and in the latter year was made a member of the royal commission formed to inquire into Indian expenditure, etc. He published *England's Duties to India* (1867); *The Wants and Means of India* (1870); articles collected in 1887; *Poverty and Un-British Rule in India* (1901), and *The Rights of Labour* (1906).

NAPA, năp'ă, city, California, and Napa County seat; altitude 20 feet, 49 miles northeast of San Francisco, on the Napa River.

The city is a trade and shipping center for the farmers and residents of Napa Valley. The transportation facilities are excellent. They include railroad (the Southern Pacific); navigable water (the Napa River), four lane highways, and air (the city has a modern airport).

The chief manufactures are: steel pipe, building blocks, gloves, paper boxes, shirts, wine, and leather. Agricultural products include grapes and other fruits.

The California Veterans' Home and Napa State Hospital are located nearby. Tourist at-

tractions include the petrified forest, mineral springs, and the Napa redwoods.

Settled in 1840, the city was incorporated in 1872. The government is administered by a mayor and 5 councilmen. Pop. (1950) 13,542.

NAPANEE, county town, Canada, of the united counties of Lennox and Addington, Ontario, on the Napanee River which is navigable from Napanee to its mouth (7 miles) in the Bay of Quinte. It is on the main line of the Canadian National Railway between Toronto and Montreal, 135 miles east of the former. The town, which originated in a mill on the river in 1785, has 15 industries, the principal ones being a concentrated milk plant and a furniture factory. It is in a good farming district and has five churches, a public school and collegiate institute, two weekly newspapers, three banks, and a park and athletic field of 32 acres. Pop. (1951) 3,863.

NAPERVILLE, nă'pēr-vīl, city, Illinois in Du Page County; altitude 693 feet; on the Du Page River; 28 miles southwest of Chicago; on the Chicago, Burlington and Quincy Railroad. Its industrial products are furniture, bags, ice cream, and cement blocks; and there are boiler works. Naperville is also a college town, seat of North Central College (Evangelical, coeducational) founded at Plainfield in 1861, removed to Naperville in 1870. Affiliated with it is the Evangelical Theological Seminary. Naperville, first settled in 1831, was named for Joseph Naper who platted the townsite in 1832 and built the first sawmill. It was incorporated as a village in 1857, as a city in 1890, and was county seat from 1839 to 1868. The city has commission form of government. Pop. (1940) 5,272; (1950) 7,013.

NAPHTALI, năf'tă-li (Hebrew, "wrestler"), the sixth son of Jacob by Bilhah, Rachel's maid (Genesis 30:7, 8), one of the 12 patriarchs and eponymous founder of one of the 12 tribes of Israel. The territory of Naphtali lay to the northwest of the Sea of Galilee; of this tribe was Barak, the hero and deliverer of Israel in the days when Deborah, the wife of Lapidoth, judged Israel. This frontier tribe was exposed to the incursions of the adjoining heathen, and is specially mentioned in the Song of Deborah as among those who "jeopardized their lives under the death" in the battle against Jabin the Canaanite king. Tiglathpileser, when he overran the north of Palestine, carried off the whole population to Assyria, after which Naphtali disappears from history. The district became famous under the name of Galilee as the home of Jesus Christ and most of his apostles. Capernaum, Tiberias, Magdala and Chorazin lay within the ancient boundaries of the tribe of Naphtali.

NAPHTHA, năf'thă, in the commercial sense a product of the fractionation of crude petroleum, obtained by the redistillation of benzine, being the heavier constituent after the benzoline has distilled over. It is also called "mineral naphtha." Another commercial article is "solvent naphtha," a somewhat similar liquid obtained in the fractionation of coal-tar, distilling over between the temperatures of 250° and 330°F. In the chemistry of the ancients the term included all inflammable liquids, especially the more fluid sorts of asphalt or bitumen; the word which is of Persian origin and signifies "moist" being

first used of the Persian product and then applied more generally. In modern usage and among chemists the term is applied to any volatile inflammable liquid product of organic decomposition, as the distillation products from peat, wood, india-rubber, bones, etc. These vary in density from 0.67 to 0.72, and in gravity from 90° to 60° Beaumé. American petroleum naphtha constitutes from 6 to 20 per cent of the crude petroleum. Russian petroleum is only 5 or 6 per cent naphtha. Scotland produces a naphtha called shale-spirit, being 4 or 5 per cent of the crude shale oil, and rather heavier than most other naphthas, but not so heavy as the coal-tar naphthas, which vary in specific gravity between .850 and .950. Caoutchine is another name for india-rubber naphtha. The uses of naphtha are various, the lighter grades being utilized as detergents in the cleansing processes preparatory to dyeing, and in the dry cleaning of clothes and gloves. The coal-tar naphthas are largely employed as solvents in making india-rubber goods. The Scotch shale-spirit is the liquid component of a wood preservative. Naphtha is also used very largely as a solvent in the extraction of oils from oil seeds, and of essential oils in the manufacture of perfumes and essences.

NAPHTHA-POISONING. While the vapors, and even the ingestion of naphtha in small quantities, have not been found poisonous to human beings, the fumes resulting from the burning of naphtha are deadly if in admixture with the air in a confined place. This poisoning effect is due to the large proportion of carbon monoxide—about 7 per cent—contained in the residual gases. A proportion of one-tenth of 1 per cent in the air renders it dangerous to the majority of persons. A considerable number of fatal accidents have been caused by breathing the exhaust gases from a gasoline-burning automobile in the restricted space of a small garage. See PETROLEUM-POISONING.

NAPHTHALENE, or NAPHTHALIN a coal-tar product consisting of carbon and hydrogen, with the chemical composition $C_{10}H_8$, and a certain chemical similarity to benzene

Its peculiar chemical composition may be represented by the graphic formula known as the condensed benzene rings, as below. These are generally written without the letter symbols, as at b.

Naphthalene is prepared from the middle or "carbolic" oil obtained in the distillation of coal-

tar between the boiling point temperatures of 410° and 460° F. The naphthalene crystallizes out on cooling, is then centrifugalized, pressed, warmed, stirred with caustic soda and, after the addition of sulphuric acid and several washings with hot water, is either sublimated or distilled. Physically, naphthalene is a white solid, with brilliant, leafy crystals, melting at 175° F. to a colorless liquid, which boils at 425° F. It burns with a sooty flame and pitchy odor. It is insoluble in cold water, slightly soluble in water at a higher temperature and easily soluble in the essences, in boiling alcohol or in ether. Naphthalene forms a multitude of various compounds, mostly by simple addition; the most important are the various sulphonic acids, such as $C_{10}H_7SO_3H + H_2O$, used in the manufacture of dyes. The nitro-derivatives of naphthalene are also extensively used as intermediates in dye-making. Under the popular name of "moth balls" or "coal-tar camphor," naphthalene is used to keep moths and other insects from clothes. It vaporizes slowly with no residue, and is useful to some extent as a disinfectant and deodorizer. Consult Tinkler, C. K., and Challenger, F., 'The Chemistry of Petroleum and Its Substitutes,' (New York 1915).

NAPHTHOL, in chemistry, a substance derived from naphthalene in the same way that phenol is derived from benzene.—that is, by replacing one of the hydrogen atoms of the

hydrocarbon by a molecule of hydroxyl, OH. Its chemical name is hydroxynaphthalene. The empirical formula for naphthalene being $C_{10}H_8$, the corresponding formula for naphthol therefore is $C_{10}H_7.OH$. In benzene the substitution can be made in only one way, because the molecule of that substance is chemically symmetrical, its hydrogen atoms being all similarly related to one another, and to the carbon atoms. In naphthalene, however, two essentially different kinds of substitution are possible, according to the position of the hydrogen atom that is replaced. This will be understood by reference to the structural formula of naphthalene, as presented herewith. The hydrogen atoms in the positions marked "a" are more directly associated with the central pair of carbon atoms than are those in the positions marked "b"; and we must therefore admit that two chemically different naphthols are possible according as the hydrogen that is replaced by hydroxyl is an "a" atom or a "b" atom. The two naphthols are in fact known, and to distinguish them from each other the prefix

"alpha" and "beta" are attached to the name. Thus "alpha-naphthol" is the compound obtained by replacing one of the "a" hydrogen atoms by OH, and "beta-naphthol" is the compound obtained by a similar replacement of a "b" atom. Both of the naphthols resemble ordinary phenol (or carboic acid), and both are used as antiseptics and also in the preparation of certain of the coal-tar colors. The naphthols exist in coal-tar in very small quantities in the fractions made at a high boiling point and may also be prepared by the action of fuming sulphuric acid upon naphthalene, followed by treatment with sodium hydroxide. In the making of a naphthol the sulphuric acid treatment is conducted at a temperature ranging from 175° to 190° F. For B-naphthol the temperature is kept at 390° F. Alpha-naphthol crystallizes in short lustrous monoclinic needles, which melt at 201° F. and boil at 543° F. Beta-naphthol crystallizes in flat plates or tablets, melts at 253° F. and boils at 547° F. Both are slightly soluble in hot water, and both dissolve freely in alcohol, ether and benzene. The solution of A-naphthol in water has a violet color; that of B-naphthol a yellow color. The naphthol derivatives of most value in the arts are their sulphonic acids, and di-sulphonic acids, and the tri-sulphonic acid of A-naphthol, and chromotrope acid or chromogen; all used in the production of coal-tar dyes.

NAPHTHYL, a hydrocarbon radical $C_{10}H_7$, occurring in the compounds and derivatives of naphthalene. It is a merely hypothetical group as it appears only in compounds. If its existence be assumed, naphthalene ($C_{10}H_8$, or $C_{10}H_7.H$) is merely its hydride; naphthol or naphthyl alcohol in the same way might be considered a hydrate of naphthyl, since its formula may be written $C_{10}H_7.OH$. Dinaphthyl ($C_{20}H_{14}$) is a carbide formed by the action of heat upon naphthalene; it is a solid and is fusible at 154° C.

NAPIER, nă'pî-ēr, **SIR CHARLES**, British naval commander, cousin of Sir Charles James and Sir William Napier (q.v.): b. Merchiston Hall, Stirlingshire, 6 March 1786; d. Merchiston Hall, Hampshire, 6 Nov. 1860. At 13 he entered the navy as a volunteer and in 1805 was promoted lieutenant. In 1807 he became commander, and from the gallantry he displayed in the pursuit of three French line-of-battle ships in 1809 was shortly after made post-captain. He was then put on halfpay and joined the British army in Portugal where he took part in the battle of Busaco. In 1814 he was dispatched to the United States, and led an expedition against Baltimore. In 1827 he received the command of the *Galatea*, in which he was employed on the coast of Portugal and the Azores. Becoming acquainted with the Duke of Terceira and other Constitutionalists, he accepted the command of their fleet, and by his defeat of the Miguelites in a naval engagement effected the relief of Oporto and the establishment of Donna Maria on the throne. For his services the Portuguese government created him Count Cape Saint Vincent and nominated him admiral-in-chief. He soon returned to England and in 1839 was ordered to the Mediterranean, where, upon the outbreak of the war between Mehemet Ali and the Porte.

and the co-operation of Britain with Russia and Austria on behalf of the latter power, he performed some of his most gallant exploits, including the storming of Sidon and the capture of Acre. Having blockaded Alexandria, he concluded on his own responsibility a convention with Mehemet Ali, by which the latter and his family were guaranteed in the hereditary sovereignty of Egypt on resigning all claim to Syria. In 1841 he was elected member of Parliament for Marylebone, and proved himself a warm advocate of liberal measures and naval reform. In 1847, while in command of the Channel fleet, he compelled the emperor of Morocco to grant compensation for the injuries inflicted by him on British commerce. On the commencement of the Crimean War he was nominated to the command of the Baltic fleet, but in this capacity had few opportunities for striking a decisive blow, which at the time somewhat disappointed his country. Sir Charles Napier was an author as well as a commander and published 'The War in Portugal' (1836); 'The War in Syria' (1842); 'The Navy, its Past and Present State' (1851). Consult Elers Napier, 'Life and Correspondence of Admiral Sir Charles Napier' (1862); Williams, H.N., 'The Life and Letters of Admiral Sir Charles Napier, K.C.B.' (London 1918).

NAPIER, **SIR CHARLES JAMES**, English soldier and administrator: b. London, 10 Aug. 1782; d. Oaklands, near Portsmouth, Hampshire, 29 Aug. 1853. He entered the army as ensign in his 12th year and within four months was gazetted lieutenant. Having become captain in 1803, he accompanied his regiment to the Peninsula and distinguished himself at Coruña, where he had the rank of major, and where, after receiving five wounds, he was taken prisoner. In 1810 he returned to the Peninsula and fought at Busaco. After obtaining the rank of colonel and taking part in most of the leading events of the Peninsular campaigns, he returned to England on the conclusion of peace. He was in the United States during the War of 1812, and after his return took part in the storming of Cambrai in 1815. From 1822 to 1830 he was governor of the island of Cephalonia, where he pleased the inhabitants better than the authorities at home. In 1841 he sailed for the East to assume the chief military command within the presidency of Bombay. He was shortly afterward called to Sind in consequence of the determination of Lord Ellenborough, then governor-general, to punish the ameer for alleged misconduct during the Afghan war. This policy was ably carried out by Napier, first by the splendid victories of Meanee (17 Feb. 1843) and Hyderabad (24 March) and afterward by the administration of Sind as a conquered province, of which Lord Ellenborough made him governor. He retired in 1841, but during the Sikh war of 1848-49 he sailed once more for the East as commander-in-chief of all the forces in India. Having taken a step which subjected him to an unceremonious rebuke from the Marquis of Dalhousie, the governor-general, he resigned and returned to England the next year. Consult Bruce, 'Life of General Sir Charles Napier' (1885); Butler, 'Sir Charles Napier' (1890).

NAPIER, John, Scottish mathematician: b. Merchiston, near Edinburgh, 1550; d. there, April 4, 1617. He was educated at St. Andrews, traveled in Europe, returned to a life of proprietorship and leisurely study, and published in 1593 his *Plaine Discovery of the Whole Revelation of St. John*, which was an original work, without a predecessor in its line. For a time he busied himself with devising instruments of war, such as "burning glasses" for firing hostile vessels; a piece of artillery for destroying everything round the arc of a circle; and a round metal chariot, from which shot might be fired through small openings while the enemy became "abased and altogether uncertain." Sir Thomas Urquhart (*The Jewel*, 1652) says that the artillery was tried on a Scottish plain with the slaughter of many sheep and cattle. His great work, *Mirifici Logarithmorum Canonis Descriptio*, appeared in 1614. This explained the nature of logarithms (q.v.), then styled "artificial numbers," and supplied the table for their application. It astonished Europe and deeply interested Kepler, who helped to extend the use of logarithms. With Henry Briggs (q.v.), Napier devised the new canon in which 0 represented the logarithm of unity and 10,000,000,000 that of the entire sine. His *Mirifici Logarithmorum Canonis Constructio* (1619) explained the method of constructing the table; and the *Rabdologia* (1617) was a description of enumeration by bone or ivory rods, which, known as "Napier's rods," were widely employed in Europe for assistance in multiplication, division and the extraction of the square and cube root. Consult Napier, Mark, *Memoirs* (1834).

NAPIER, Robert Cornelis LORD NAPIER OF MAGDALA, English soldier: b. Ceylon, Dec. 6, 1810; d. London, Jan. 14, 1890. Educated at the Military College, Addiscombe, he entered the Bengal Engineers, and during the second Sikh war (1848) was present as chief engineer at the siege of Multan, and after its fall took part in the battle of Gujarat. When the Mutiny broke out in 1857 he was appointed chief of the staff to Sir James Outram (q.v.), and in the second relief of Lucknow he constructed the engineering works which enabled Sir Colin Campbell (q.v.) to capture the city. In the Chinese campaign of 1860 he was second in command, and in 1865 became commander in chief of the Bombay army. He commanded in 1868 the expeditionary force against King Theodore of Abyssinia, defeated the king's forces, released the English prisoners and stormed the mountain fortress of Magdala (April, 1868). For his services in this short but brilliant campaign he was rewarded with a peerage and a pension. Subsequently he was appointed commander in chief in India (1870), governor of Gibraltar (1876) and constable of the Tower (1887). At his death he was buried in St. Paul's with military honors. Consult Markham, *History of the Abyssinian Expedition* (1869), and Escott, *Pillars of the Empire* (1879).

NAPIER, Sir William Francis Patrick, British soldier and author, brother of Sir Charles James Napier (q.v.): b. Kildare, Ireland, Dec. 17, 1785; d. Scinde House, Clapham, London, Feb. 12, 1860. At 14 he entered the army with his brothers Charles and George, took a distinguished part in the Peninsular

campaigns, received seven decorations for the share borne by him in as many principal actions, including Busaco, Salamanca, the Nivelle and Orthez. Some years later he began his celebrated *History of the Peninsular War* (6 vols., 1828-1840). It furnishes the best and most interesting record existing of the momentous transactions which it chronicles, though from its opposition to the prevailing politics of the day, its merits were at first insufficiently appreciated. In 1841 he was advanced to the rank of major general, was appointed lieutenant-governor of Guernsey the following year and in 1848 created a K.C.B. Criticisms on his brother's proceedings in India called him forth as his champion, and produced successively the *Conquest of Scinde* (1845); *History of Sir Charles Napier's Administration of Scinde* (1851); and *Life and Opinions of the Late Sir Charles Napier* (1857). He also wrote *English Battles and Sieges in the Peninsula*. Consult *Life* by Lord Aberdare (1864).

NAPIER OF MAGDALA. See NAPIER, ROBERT CORNELIS.

NAPIER. The chief town and port of the district of Hawkes Bay, east coast of North Island, New Zealand. It is the center of a large district of squatters and is rather wealthy for its size. Being a peninsula, it has excellent harbors. Its bay ranks with that of Naples for picturesqueness. The exports are wool and frozen meats. The town has freezing plants and a number of other prosperous industries. It has a beautiful cathedral, the Church of St. John. Napier is a famous winter resort. Pop. (1936) 15,302 (with suburbs, 18,689).

NAPIER'S RODS, in *mathematics*, a set of rods contrived by John Napier in 1617 for the purpose of facilitating the numerical operations of multiplication and division.

NAPLES, nă'plz (It. NAPOLI, nă'pō-lē; anc. NEAPOLIS), commune and city of Italy, the capital of the province of the same name and of the region Campania, is situated on the north shore of the Bay of Naples (q.v.), 120 miles southeast of Rome. For centuries the capital of the Kingdom of Naples (q.v.) and of that of the Two Sicilies (see SICILIES, THE TWO), it is still the commercial and cultural center of southern Italy. It ranks as the country's third largest city in population and is, after Genoa, its busiest port. The incomparable natural beauties and balmy climate have charmed visitors from all over the world, starting with Virgil, who is buried in nearby Posillipo, down to Wolfgang Goethe, Percy B. Shelley, Giacomo Leopardi and the innumerable tourists who visit it every year. Its gay festivals and songs have also acted as a special attraction.

Naples occupies a fan-shaped area about five miles long along the bay and stretches inland up the slopes of the surrounding hills. The older quarters—among them Santa Lucia, still the most characteristic—and the business districts lie near the coast and on the lower slopes, while the more modern residential sections extend well up the hills, especially the Vomero. Along the waterfront, from Castel Nuovo to the little fishermen's inlet of Mergellina, runs a beautiful thoroughfare: here is the picturesque little port of Santa Lucia. Beyond Mergellina, the road

winds up the hill to Posillipo, noted for its beautiful villas. The slums of Naples have long been among the worst in Europe, overcrowding, disease, crime, and misery plaguing its narrow alleys. A modernization program, which had a slow start after the cholera epidemic of 1884, is still under way and progress is being made.

Tourist trade is one of the city's sources of income, as its industrial development has never been commensurate to its commercial and cultural importance. In and around Naples there are, however, food processing plants, railroad shops, shipyards, iron and steel works, an oil refinery, and factories producing leather goods and chemicals. Naples is still the import and export center for all of southern Italy. Improvements of the natural harbor were first started in the 13th century, continued by the Bourbons, and more efficiently undertaken by the Italian government in recent years. During World War II the harbor facilities were practically obliterated by Allied bombings and pitiless demolition by the retreating Germans. Reconstruction is now almost completed.

The seat of an archbishop, Naples boasts more than 200 churches: many date back to the 13th and 14th centuries, but were extensively restored in the 17th and 18th centuries, the golden era of the Neapolitan baroque, when a large number of new churches were also erected. Santa Chiara, the church of royalty and nobility, is perhaps the finest; it has tombs of the Angevins and a beautiful 17th-century cloister. It suffered severe damage during World War II as did the Church of Monteoliveto, rich in Renaissance sculpture. In the cathedral is the chapel of San Gennaro (St. Januarius), an example of 17th century Neapolitan art; it contains, among other relics of the saint, who is the patron of Naples, two vials of his blood, said to come to a boil twice a year, a miracle witnessed excitedly by hundreds of Neapolitans. San Giovanni a Carbonara, San Domenico Maggiore, i Gerolomini, and Santi Severino and Sosio are but a few of the churches deserving special mention. The Royal Palace (1600-1602) contains the National Library.

Of the city's medieval castles, Castel Nuovo (13th century) dominates the port and has a sculptured Renaissance triumphal arch; Castel dell'Ovo, on a rocky islet off the promenade, dates from 1128; and imposing Castel Sant'Elmo (14th century) overlooks the city from a hill. On another hill stands the Royal Palace of Capodimonte, with a collection of 19th century Neapolitan paintings and fine specimens of the ceramics made here in the factory founded by Charles of Bourbon in 1737, now closed. The National Museum of Naples is one of the richest in Italy: it contains the famous Farnese collection and all findings from Pompeii, Herculaneum, and other neighboring towns.

Naples had also a rich cultural life: in the 17th century a painting school flourished, and in the 17th and the 18th the greatest musical brilliance was achieved with Alessandro and Domenico Scarlatti, Giovanni Paisiello, Domenico Cimarosa and G. B. Pergolesi. The Conservatory of Music and the San Carlo Opera House, founded in 1737, are among the country's best. Founded by Emperor Frederick II in 1224, the university is southern Italy's chief school of higher learning and has a brilliant law school. The archives of state contained a great amount

of important documents, but many of them, together with books from the National Library, were burned by the Germans in 1943. The Zoological Station has a world-famous aquarium where the incredible variety of the bay's submarine life can be admired.

History.—Naples was founded by Greek colonists, probably from Cumae, in the 7th century. The settlement (or settlements) was known by the names Parthenope, Palaepolis, and Neapolis, but the distinction does not seem clear. The town emerged as a center of Greek culture, and such it remained even after the Roman conquest (4th century B.C.). Attracted by its beauty, climate, and culture, the Romans soon started to build their villas in the area, which became one of their favorite resorts. In the 6th century Naples passed to the Byzantines, but it gradually developed an independent government. As a duchy (763-1139) Naples prospered, but the Norman conquest of southern Italy ended its liberty; after a prolonged resistance it had to yield in 1139 to Roger II, who incorporated it into his Kingdom of Sicily. With the advent of the Angevin dynasty (1266) Naples gained new importance; after the loss of Sicily, Charles I transferred his capital here and the city gave its name to the Kingdom of Naples. Later it was also the capital of the Kingdom of the Two Sicilies, until Giuseppe Garibaldi made his triumphal entry on Sept. 7, 1860. Annexation to the Kingdom of Sardinia (of Italy after 1861) followed soon after. During World War II Naples suffered severe damage; Allied troops liberated it Sept. 30, 1943. Pop. of the commune (1951) 1,011,919.

NAPLES, Bay of, a semicircular inlet of the Tyrrhenian Sea, about 20 miles long and 10 miles wide, on the west coast of the Italian peninsula, between Cape Miseno and Punta Campanella. Surrounded by green hills and dominated by the imposing Mount Vesuvius (q.v.), the bay is considered one of the most beautiful in the world. The coastline is dotted with towns and resorts, among them Naples, Pozzuoli, Portici, Torre Annunziata, Castellammare di Stabia, and Sorrento. The semitropical islands of Capri, Ischia, and Procida stand at the entrance of the bay.

NAPLES, Kingdom of, a former state of Italy, covering the southern portion of the peninsula, south of the Papal States. Although it existed at various times as a completely separated entity, it was long united with Sicily to form the so-called Kingdom of the Two Sicilies (see SICILIES, THE TWO). Naples was the capital. After the 12th century, southern Italy was a part of the Kingdom of Sicily founded by the Normans. When Charles I of Anjou (q.v.), who was invested with the crown in 1266, lost Sicily following the Sicilian Vespers (1282), the mainland territories left under Charles became known as the Kingdom of Naples. The Angevin claim to Sicily, now ruled by the Aragonese, caused a series of wars, until Queen Joanna I of Naples gave up her claims in 1372. Long and bloody dynastic struggles within the Kingdom of Naples among the Houses of Anjou, Durazzo, and later Aragon, ended only in 1443, when Alphonso V of Aragon won the throne of Naples by defeating René I of Anjou (q.v.). However, the Angevin claim, which had passed to the

French crown, led Charles VIII and Louis XII of France to invade Naples; the last Aragonese king was deposed in 1501. After the defeat of Louis, the Treaty of Blois assigned both Naples and Sicily to Spain, which ruled jointly the two kingdoms through viceroys from 1504 until 1707. This was a period of decay: Spanish officials exploited the countries, the creation of large estates depressed agriculture, no commercial nor cultural progress was made. Poverty, ignorance, and superstition reigned supreme. A popular revolt in Naples (1647) led by Masaniello (q.v.) was violently suppressed. During the War of the Spanish Succession the kingdom was conquered by Austria, but Charles of Bourbon (later Charles III of Spain, q.v.) succeeded in recapturing both Naples and Sicily in 1734. The direct rule by the cadet line of the Spanish branch of the Bourbons did not improve the situation. Some reforms were occasionally made, only to be revoked as soon as conditions permitted. In 1799 the liberal revolution in Naples, supported by French arms, resulted in the creation of the short-lived Parthenopean Republic (q.v.). Finally in 1805 King Ferdinand IV was forced by the French to flee to Sicily, which remained under his rule throughout the Napoleonic period. Napoleon placed on the throne of Naples first his brother Joseph, then his brother-in-law Joachim Murat (q.v.). After the fall of Napoleon, Ferdinand, who had hitherto borne the titles of Ferdinand IV of Naples and Ferdinand II of Sicily, returned to Naples and formally merged the two kingdoms (1816), styling himself Ferdinand I of the Two Sicilies.

NAPLES YELLOW (ANTIMONY YELLOW or NEAPOLITAN YELLOW) is a very poisonous lead antimonate pigment, varying in color from orange-yellow to sulphur-yellow. Although seldom used in paints, it has been applied in ceramics since ancient times. Because various substitute mixtures such as Venetian red with zinc white and cadmium yellow are called by the same name, it has come to identify a general shade of yellow rather than a specific pigment or chemical compound.

NAPO, nã'põ, river, Ecuador, an affluent of the Amazon, which rises on the north side of Cotopaxi, and after a southeasterly course, forming for a considerable distance the boundary between Colombia and Ecuador, joins the Amazon just beyond the eastern boundary of Peru. It is navigable for nearly 500 miles for steamers; it flows through a region rich in mineral and vegetable wealth.

NAPOLEON I, nã-põ-lë'ün (full French name NAPOLEON BONAPARTE; Ital. NAPOLEONE BUONAPARTE; called LE PETIT CAPORAL and THE CORSICAN), emperor of the French: b. Ajaccio, Corsica, Aug. 15, 1769; d. Longwood, St. Helena, May 5, 1821. His father, Carlo Maria Buonaparte, a lawyer, claimed nobility, and his claim was accepted by the French authorities, although the grand dukes of Tuscany had never recognized the pretensions of the Corsican Buonapartes to kinship with the noble Florentine family of the same name. Carlo, in 1764, at 18, had married Maria Letizia Ramolino. Eight of their 13 children survived, and were destined to live illustrious lives: JOSEPH (1768-1844), the future king of Naples; NAPOLEON (1769-1821, the emperor;

this first name had been adopted from an old Corsican family, the Bozzis, with whom the Buonapartes were allied; their first child, b. and d. 1765, had already been named Napoleon); LUCIEN (1775-1840); MARIE ANNA ELISA (1777-1820); LOUIS (1778-1846, king of Holland, the father of Charles-Louis-Napoleon who was to reign as Napoleon III); MARIA PAULINA (originally CARLOTTA, 1780-1825, married first to Gen. Emmanuel Leclerc, later to Prince Camillo Borghese); MARIA ANNUNCIATA, later CAROLINA (1782-1839, married Joachim Murat, king of Naples); and JÉRÔME (1784-1860, king of Westphalia). The father died in 1785, and thenceforth Napoleon, the strongest-willed of them all, was head of the family. During all his life he showed a kind of clannish loyalty which made him shower honors and riches on all members of the tribe, and extend his generousities to the protectors of his youth. For parentage and family relationships see BONAPARTE articles.

Corsica had been acquired by the French from Genoa in 1768, and secured just before the birth of Napoleon, after the defeat at Ponte Novo of the forces of resistance led by Pasquale di Paoli, who fled to England. Carlo Buonaparte had first fought the French, but he quickly rallied to their side and befriended the governor, Gen. L. C. R. de Marbeuf; in January 1779, he went to France with his two older sons, placed them in the college at Autun, in east central France, and secured a king's scholarship for Napoleon at the Military Academy at Brienne, 25 miles from Troyes. The boy was not yet ten when he entered this school (March 23, 1779), where he was to stay until October 1784. His school years were neither particularly happy nor brilliant; he seems to have made few real friends, except for L. A. F. de Bourrienne (q.v.) and to have felt like a stranger among the French boys. He had a very perceptible Italian accent, yearned for the liberation of Corsica, and still looked up to Paoli as his hero. His marks were not outstanding except in mathematics, and at the final examination, he placed 42d out of 58. Upon being graduated as a second lieutenant in September 1785, he was assigned to an artillery regiment, and was stationed in turn at Valence, Lyon, Douai, Auxonne, and again at Valence (1791) as a first lieutenant. Having no liking for garrison life in provincial towns, he obtained numerous lengthy leaves which he spent in Ajaccio and Paris. During the period 1785-1793 he managed to spend 59 months on more or less regular furloughs.

As a son of the Enlightenment Napoleon had welcomed the dawn of the revolution, from July 1789 on, and after Corsica had been incorporated into France in November, and Paoli allowed to return, he took advantage of the opportunity to play a role in the politics of his native island. He was elected lieutenant colonel in the Corsican national guard. A rift had developed between Paoli and Count Carlo Andrea Pozzo di Borgo on one side and the Buonaparte clan on the other, and Napoleon used such violent methods against the faction of Pozzo di Borgo in the spring of 1792 that he had to go back to Paris to justify himself. He was reinstated in the regular army as a captain in July. In Paris, he witnessed the bloody events of June 20 and August 10, which gave him a healthy scorn for mob violence as well as for the vacillations of Louis XVI. In January 1793, he took part in the abortive inva-

sion of the Sardinian island of Maddalena. When England entered the war against France, Paoli, whose pro-English sympathies were well known, was denounced as an English agent, and his arrest was ordered by the Convention. The break between Paoli and the French became open, and the Buonaparte family had to flee the island and take refuge in Marseille. Corsica was taken over by the British Navy, which was to keep it until the fall of 1796. Thus was Napoleon finally compelled to renounce his Corsican dreams and to turn to France for his destiny.

During his garrison years, he had equipped himself with a considerable amount of knowledge, reading voraciously anything at hand and taking abundant notes, on Voltaire, Rousseau, the writers of the Enlightenment, a host of history books, and especially manuals on tactics, like the *Essai de tactique générale* (1772) of Count J. A. H. de Guibert, which brought to his attention the need for speedy offensive, for a lightening of striking columns, for a concentration of forces: all the principles he would later apply in such masterly fashion. He even published in July 1793 a short political pamphlet in dialogue form, the *Souper de Beaucaire*, in which the weaknesses of the federalist movement of the Girondins are analyzed; it constitutes an unequivocal profession of the tenets of the centralist Parisian group called the Mountain. At the end of August, Toulon and the French Fleet were delivered to the British by rebellious federalist and royalist groups. The Army of Italy was entrusted with the task of recapturing the harbor, and here we find the first real opportunity for Napoleon. Thanks to his Corsican friend, A. C. Saliceti, he was placed in command of the artillery of the besieging forces and given a free hand to put into effect his plan of concentrating the attack on the fort of Eguillette, which dominated the roadstead. After violent action, in which Napoleon was twice wounded, the fort fell on Dec. 17, 1793, and the British retired, leaving a good part of the French Fleet and the port installations intact. Two months later, Napoleon Buonaparte was promoted to brigadier general.

The upheaval of 9 Thermidor (July 27, 1794) threatened to put a stop to his progress; he had come to be identified with the Robespierre faction, and was arrested and detained some time at Antibes. But at the beginning of 1795, he was entrusted with the preparation of a new expedition against Corsica which, however, came to naught. Then he received an order to rejoin the Army of the West, to campaign against the insurgent Vendéens. This he refused to do and was struck off the list of active officers.

Marriage and the Italian Campaigns.—The crisis of Vendémiaire (October 1795) offered him his second decisive opportunity. The Convention was confronted by an incipient insurrection of monarchist forces gathered around the St. Roch Church. One of its members, Vicomte Paul François Jean Nicolas de Barras, remembering Napoleon at the siege of Toulon, called upon him to save the Convention, which he did by having Joachim Murat bring in artillery from the Camp des Sablons, thus checkmating the insurgents. His stature having grown considerably, he was a few months later named by the succeeding government, the Directory, to the command of the Army of Italy (March 2, 1796). This promotion was perfectly proper since he had been connected before with this army and

had drafted strategic plans for it, but it was helped by his new friendship with Barras and the elegant circles he was now frequenting. He had fallen violently in love with one of the queens of fashion of the time, Joséphine de Beauharnais, whose husband, an erstwhile commander of the Army of the Rhine, had been guillotined in 1793, and whose languid charm (she was born in Martinique) fascinated him. Despite the difference in age—she was 33, he 27—despite the fact that she had two children, Eugène and Hortense, and had no financial resources, they regularized their situation and were married on March 9, 1796. All through the years, in spite of her infidelities, of the barrenness of their union, even of his repudiation of her in 1810, he always kept for her a deep and warm feeling, tinged with passionate romanticism. Her death in May 1814 caused him genuine sorrow.

At the time of his marriage Napoleon changed his name from Buonaparte to Bonaparte. He arrived at his headquarters in Nice on March 27, 1796, and soon afterwards initiated the series of Italian campaigns which were to last 20 months, until November 1797, and which were destined to reveal his military genius and provide an unequalled classic to students of strategy. He had under his command an army of 38,000 fairly good troops and he was opposed by Gen. J. P. de Beaulieu with 30,000 Austrians, and Gen. Michele Colli with about 25,000 Piedmontese. In a few days, Bonaparte defeated Beaulieu at Montenotte, west of Genoa, Colli at Mondovi, and signed with the latter an armistice at Cherasco (April 28, 1796). Pursuing Beaulieu, he crossed the Adda at Lodi, after a brilliant action—about which he would write at St. Helena, "It made me conceive the ambition of performing great things"—and entered Milan on May 14. Beaulieu had retreated towards the Mincio and Mantua. Bonaparte beat him again and laid siege to Mantua.

Italy, however, was only a secondary theater of war, the main one being on the Rhine, where Gen. J. V. Moreau had about 200,000 troops facing a similar force of Austrians. But the enemy, with interior lines of communications, was freer to shift troops from one theater to the other, which he did, thanks to Moreau's inaction, at the end of July. Count D. S. von Wurmser, succeeding Beaulieu, descended into Italy on both banks of Lake Garda, with 45,000 men in three columns. Abandoning the siege of Mantua, Napoleon established himself south of Lake Garda, and struck successively at Wurmser's columns at Lonato (July 31) and Castiglione (August 5). While Wurmser was re-establishing himself on the Brenta, Napoleon advanced up the Adige to take Trent, then came down on Wurmser's rear, forcing him to retreat to Mantua, where he was surrounded. A new Austrian commander, Josef Alvinczy, descended into Italy through the Brenner Pass with 50,000 men. Napoleon, having established himself at Verona, advanced 15 miles to Arcole to meet him; three days of hard fighting ensued (November 15-17) in the course of which Napoleon personally led an assault on the bridge across the Alpone River, administering a severe defeat on the new Austrian commander.

At that time, the Directory decided to make Italy a more important theater of war at the beginning of 1797 and to send Napoleon 40,000 reinforcements; but they did not arrive until

March, after the main battles had been fought. Alvinczy, having been ordered to try once again to relieve Mantua, advanced from Roveredo in three columns. Napoleon smashed the main one at Rivoli (Jan. 14, 1797), then hastened back to Mantua to block a relief column coming from Padua. On February 2, Wurmser was forced by famine to surrender Mantua, and on the same day Napoleon ended his armistice with the pope and occupied the Papal States. Final victory was now in sight. Napoleon had about 80,000 men with whom he pushed via the Trieste route into the Tirol, pursuing the Archduke Charles to Klagenfurt, then to Leoben, where, on April 18, he signed peace preliminaries.

The personal policy of Bonaparte was now everywhere in evidence: his excessive requisitions; the occupation of Venice; the organization of the Cispadane Republic (q.v.) in 1796, merged a year later into the Cisalpine Republic (q.v.); his direct negotiations with the pope—everything shows the civilian power of the Directory consistently neglected, and compelled to follow the initiatives of the victorious general. The Treaty of Campoformio (Oct. 17, 1797) gave to France Belgium, the Ionian Islands, the promise of the left bank of the Rhine, and recognized the Cisalpine Republic, while Austria received Venice, with her territories up to the Adige.

Egypt.—In December 1797, Napoleon, back in Paris, was acclaimed a triumphant hero. But England had not disarmed, and the Directory proposed an expedition across the English Channel, naming Bonaparte commander of the Army of England. An inspection of the Channel bases, however, convinced him of the impracticability of the project. Another idea already had taken root in his mind, and was being nurtured by Talleyrand: strike at England by cutting her Mediterranean commercial route to India. That meant an expedition to Egypt. It was rapidly organized from March to May 1798, in the harbors of Toulon, Genoa, Civita-Vecchia, and in Corsica and comprised 280 transports, protected by more than 55 war vessels, and carrying 38,000 troops, 1,200 horses, and 171 guns. Moreover, it was to transport a mission of almost 200 scientists including archaeologists. A contribution of 3 million francs levied upon Switzerland had helped finance the enterprise. The fleet sailed on May 19, concentrated off Sardinia, then took over Malta with little difficulty. The British were still uncertain of its destination, but Horatio Nelson sailed towards Alexandria, where he arrived two days before the French, then returned to Sicily.

The French expedition disembarked at Admir on July 1 and occupied Alexandria the next day. Then the advance began to Cairo, across a desert and up the Nile's left bank. Napoleon expected a popular uprising against the feudal Mamelukes, but this failed to materialize. After a preliminary clash with the Mameluke cavalry on July 13, he defeated them on July 21, near the Pyramids, forming his infantry in squares to repel their charges. Entering Cairo, he established his headquarters there and attempted to gain the good will of the Egyptians. However, on August 1, Nelson surprised the French Fleet at Aboukir and annihilated it, except for two ships.

Thus marooned in Egypt, Napoleon spent the rest of the year establishing his domination over the country, trying vainly to discover ways of pushing on to India, and participating in the work of the scientific mission, which in particular was

preparing the first draft of what was to become the Suez Canal. At the beginning of 1799 he had to forestall an attack on Egypt by invading Syria and taking Jaffa, infested by the plague (March 6). But he failed before Acre (May 20), defended by Commodore William Sidney Smith and Colonel A. Le Ricard de Philippeaux, an émigré whom he had known at Brienne. Back in Egypt, he annihilated a Turkish force which had landed at Aboukir (July 25). The Directory had tried to re-establish communications with Egypt by sending Admiral E. E. Bruix into the Mediterranean, but to no avail. It also had authorized Bonaparte to return; these instructions never reached him, but he had decided on his own to sail back, upon learning disquieting political and military news from France. He left secretly August 24, managed to escape, with great luck, the British blockade and landed at Fréjus October 9.

The Consulate.—He was acclaimed by the populace. The Second Coalition had inflicted severe reverses upon France and Italy had been lost. Gen. André Masséna, it is true, by his victory at Zürich had begun to re-establish the situation; but internally, the Directory could only govern by alternate illegal blows on the right and on the left. Inflation was rampant, the capitalist bourgeoisie was fearful, the troops extremely dissatisfied, and many people were thinking of a change in the constitution and looking around for a savior. Bonaparte allied himself with one of the five directors, Abbé Sieyès, and a coup d'état was engineered: on November 9 (18 Brumaire) the transfer of the two assemblies, the Ancients and the Five Hundred, to a Paris suburb, St. Cloud, was voted, and Napoleon received command of the Paris garrison. The next day, after a great deal of floundering, and when he had been saved from possible physical violence and outlawing only by the presence of mind of his brother Lucien, who was president of the Five Hundred, Napoleon finally sent in Murat's grenadiers to expel the deputies. During the evening the Ancients named three provisional consuls—Sieyès, (Pierre) Roger Ducos, and Napoleon.

Sieyès had expected to be able to keep Napoleon in secondary position; but it soon became apparent who would be the master. The admirably coordinated physical and mental abilities of Napoleon proclaimed his superiority. He was endowed with an amazing capacity for work, an astonishing speed of judgment, and an extraordinary power of assimilation, capped by untiring imagination. He possessed, moreover, a great deal of charm, and a natural authority based on a wide gamut of attitudes, from calculated simplicity to a skillful use of violence. Having climbed almost to the top, he was playing a sharp and prudent game to reach the pinnacle of power.

Now he came near to assuming the garb of an intellectual, and expressed the sentiments of a middle-of-the-roader. He proclaimed his desire for internal security and social order, and for the peace which he knew France craved. While thus cultivating popularity, he carried on discussions on the draft of a new constitution, which was to be a compromise between the ideas of Sieyès and his own authoritarian tendencies. The provision of a list of notabilities from which eligible candidates must be chosen effectively smothered democratic suffrage. The legislative power was broken down into four assemblies: the Tribunate,

the Legislative Body, the Council of State, and the Senate. The executive was in the hands of three Consuls, of whom the First Consul had the widest executive powers, together with the power of initiating laws. Sieyès, on the invitation of Napoleon, designated as Consuls the minister of justice, J. J. R. de Cambacérès and Charles François Lebrun, Napoleon himself to be First Consul. A plebiscite ratified the constitution by 3,011,007 ayes against 1,562 noes (February 1800).

Now in the saddle, Napoleon began to consolidate his power and to pursue the two policies which were expected of him: peace and the establishment of internal order. Taking command of the Army of Reserve, he crossed the Alps at the Grand St. Bernard (May 15, 1800) and entered Milan on June 2. In the Piedmont plain, his army unexpectedly met a much stronger Austrian force at Marengo on June 14. The French troops were retreating in disorder, when the arrival of Gen. L. C. A. Desaix de Veygoux and a strong charge by François Christophe Kellerman saved the day. The first couriers had brought to Paris reports of a defeat, which caused rejoicing among the First Consul's enemies. But news of the victory supervening silenced the opposition and, as a royalist agent said at the time, "Marengo was the christening of Napoleon's personal power." The peace with Austria was secured only after the success of Jean Victor Moreau at Hohenlinden December 3, and was signed at Lunéville (Feb. 9, 1801), giving France the left bank of the Rhine, extending the Cisalpine Republic to the Adige and generally confirming the clauses of the Treaty of Campoformio. As for England, faced by an economic crisis and by the dissolution of the Coalition, she signed a peace treaty at Amiens (March 25, 1802), keeping Ceylon and Trinidad, but giving up Egypt, Minorca, Elba, and Malta, the last of which was supposed to be evacuated inside of three months. That peace, however precarious, was the first general peace in Europe in a decade.

At the same time Napoleon was reorganizing France and giving her a body of institutions which were to last through the 19th century and to a certain extent still form the basis of her present structure: he maintained the administrative divisions created by the revolution (departments, etc.) but put at their head appointed functionaries (prefects, etc.) and generally emphasized centralization. He reorganized justice and took an active part, although more modest than has been believed, in framing the Civil Code (see CODE—*Code Napoléon*), which reaffirms the judicial conquests of the revolution: personal liberty, freedom of conscience and of work, property rights, equality. Consecrating the ruin of legalized privilege, the code was to serve as a model for many European and American states during the 19th century. It is the main basis for Napoleon's claim that he was the heir and savior of the revolution.

Napoleon also made important reforms in government financing. The assessment and collection of taxes were thenceforth reserved to functionaries of the central power, and collectors were required to make a deposit in advance of their collections. He established the Bank of France and fixed the relation of 15.5 between gold and silver and the value of the gram of gold at 3 francs 10 centimes; that standard was to last until 1926. He was much interested in educa-

tion, as a way of controlling the minds of men, and as a means of training military officers and civil servants. After several years of discussion he created the Université de France, really a ministry of education to license teachers, set the program of studies and control the examinations. This centralized and near-monopolistic conception of education has prevailed in France to the present time. In this work of reorganization, he lacked the omniscience which has sometimes been attributed to him, but he had the good sense to make use of the best experts, regardless of their political inclinations and of their past. Napoleon may be said to have consolidated the conquests made during the revolution by the bourgeoisie, and to have solidified the French civil service, for better or for worse, into the form it still retains.

Despite the victory of Marengo, opposition to the First Consul was not immediately disarmed. The royalists were agitating in Vendée and, in Paris, Georges Cadoudal exploded an infernal machine which killed 22 people but missed Bonaparte. He retaliated against both the right and the left, transporting republicans to Guiana, and executing some monarchists. To undermine the royalist party, he decided on a rapprochement with the church: this was attained by the Concordat (July 15, 1801), which recognized Catholicism as the religion of the majority of Frenchmen. The First Consul would nominate the bishops, the pope give them the spiritual investiture; the clergy would be paid by the government. The *Organic Articles*, a law regulating public worship comprising 77 articles relating to Catholicism and 44 to Protestantism, were combined with the Concordat and both ratified on April 8, 1802. Not accepted by the pope, the *Organic Articles* made the church more subservient to state authority. The Concordat and *Organic Articles* were to govern the relations of church and state in France for more than a century until their abrogation in 1905 by the law of separation. The other cults, Protestant and Jewish, were similarly reorganized. Some opposition to these clerical measures continuing in the Tribunate, he broke it by skillful manipulation of the procedure for renewal of members. He also had his police disperse the opposition which gathered in Mme. de Staël's salon and kept her in semiexile 60 miles from Paris. His aim to achieve absolute power was now unmistakable. On Aug. 4, 1802, a new constitution made him Consul for life, and subordinated the Assemblies to him.

Emperor.—The final break with the royalists came after another plot by Cadoudal was discovered, and its organizer shot. On the night of March 15, 1804, Napoleon had his troops kidnap the duke of Enghien (Louis Antoine Henri de Bourbon-Condé) at Ettenheim, Baden, and had him shot summarily at Vincennes; thus he proclaimed himself an accomplice of the regicides of 1792. After further manipulation of public opinion, the question arose of giving Bonaparte supreme powers. On May 18, 1804, the Senate declared that "it was of the highest interest of the French people to entrust the government of the Republic to an hereditary Emperor," and established the order of succession by male primogeniture. A plebiscite accepted the proposal by 3,572,329 ayes against 2,579 noes.

The pope was induced to come to Paris and preside at coronation ceremonies held in the Cathedral of Notre Dame on Dec. 2, 1804. Na-

napoleon, however, made a point of crowning himself to avoid any quarrel over investiture; he also crowned Josephine. Catholic France was now obliged to acquiesce in Bonaparte's elevation. To give the new dynasty a prestige comparable to the monarchy's a court was organized; some émigrés were induced to return, while a new nobility was created, based on military exploits or civilian services, which has survived to this day. This new imperial court never attained the elegant nonchalance of the *ancien régime*; it was too military, sometimes vulgar, and could never shake off the memories of its origins. But it helped establish the imperial domination, which asserted itself also through a servile press, a subservient literature, an efficient police, a regimented university system, and even a controlled church. The institution of the Legion of Honor (1802), with its ranks (*grand officier, commandeur, officier, chevalier*), and the selection of its members reserved to Napoleon, was another means of gaining the loyalty of a new hierarchy of talents. The master supervised everything, from the building of strategic highways in the Alps, to the Sèvres manufacture of porcelain. In 1812, in Moscow, just before the retreat, he gave the Comédie-Française a statute which is still in force in its general lines. Napoleon's authority, much tighter than the Bourbons', smacked of enlightened despotism; it foreshadowed modern totalitarianism.

The Peace of Amiens (March 25, 1802) was short-lived. English businessmen were disappointed by French tariff restrictions which hampered trade. France, with her purchase of Louisiana from Spain (1800) and the San Domingo expedition of 1802, seemed bent on acquiring another colonial empire. Moreover, early in 1802 Bonaparte intervened in Switzerland to have the Valais canton constituted an independent republic (later annexed to France); and in August of the same year he annexed Elba, then Piedmont in September, and Parma in October. By the Act of Mediation (Feb. 19, 1803) he restored the Swiss confederation, re-establishing the cantonal system. In the same month he suppressed free cities and ecclesiastical principalities in Germany. England seized upon these aggressions as a reason for declining to evacuate Malta. It is idle to speculate on the responsibilities for the renewal of the war. The fact is that French continental dynamism and English ambition for sea domination simply could not coexist peacefully. On April 26, 1803, an English ultimatum left no alternative but war. Early in May, France sold Louisiana to the United States, Napoleon realizing that the vast province, so difficult to defend, would be a liability, and American gold an asset in the coming conflict.

The war started slowly, for lack of a convenient theater. Napoleon had already begun before 1802 to assemble a barge flotilla as a threat to invade England. It was considerably enlarged in 1803 and 1804 and the decision for an invasion was finally made in the latter year. An expeditionary force was concentrated at Boulogne and a plan was devised to obtain French control of the English Channel for a period long enough to ensure the safe convoy of the troops. Vice Admiral P. C. J. B. S. de Villeneuve was ordered to sail for the West Indies, in order to attract Nelson's English Fleet there, and then to return in haste to cover the Channel crossing. The plan started well enough, Villeneuve sailing from

Toulon on Jan. 18, 1805. He succeeded in luring the English Fleet to the Antilles, but due to a combination of bad luck, poor orders and incompetence, he found himself on the return voyage blockaded in Cádiz by Nelson's superior fleet. The invasion was doomed and Napoleon abandoned it on August 24. Upon orders to sail for Naples, Villeneuve sallied forth and was caught off Trafalgar by Nelson, who attacked his line of 33 ships with two columns, ruptured it and annihilated the center and rear guard (Oct. 21, 1805). Though Nelson was killed at Trafalgar, thenceforth command of the sea was assured to England and Napoleon was forced to limit his ambitions to continental conquests.

A new coalition, the third, had already been formed (Aug. 9, 1805), between England, Russia, and Austria, which had been affronted by the transformation of the Republic of Italy into an hereditary kingdom, with Napoleon as king, and his stepson Eugène as viceroy. Napoleon shifted his army from Boulogne to the Rhine, the Main and the Danube, there to surround the forces of the Austrian general, Karl Mack von Leiberich at Ulm (October 18), to take Linz and Vienna and, shifting north, to meet the Russians and Austrians at Austerlitz (December 2). Although outnumbered, 65,000 to 82,500, Napoleon succeeded by a feint on his right in throwing the enemy center out of balance, then breaking through, he put the allied troops to flight across frozen marshes, where French artillery decimated them. The French suffered 6,800 casualties and inflicted 27,200 (including 12,200 killed and wounded and 15,000 prisoners). Austerlitz is surely the most brilliant and most decisive of Napoleon's victories. It has become the mainstay of his military glory. Austria, by the Treaty of Pressburg (Bratislava, Dec. 26, 1805), gave up Venetia and recognized Bavaria, Württemberg, and Baden as independent kingdoms, thus excluding herself from southern Germany.

Prussia had stayed out of the third coalition. But during the summer of 1806, she became annoyed and worried by the double-dealing diplomatic maneuvers about Hannover and by the formation of the Confederation of the Rhine (July 12), which excluded her from western and southern Germany. A Prussian ultimatum demanded that the French withdraw behind the Rhine (Oct. 1, 1806). Upon its rejection, the fourth coalition was organized, grouping England, Russia, and Prussia. The Prussians had an army of 130,000 men, steeped in the tradition of Frederick the Great, and enjoying a high military reputation, but cumbersome, slow-moving, and unable to cope with the newer, lightning-like strategy of the emperor. Napoleon had concentrated his army, roughly equal to the Prussian force, along the Main Valley. Each army tried to cut the other's communications on the left, but the slower Prussians were forced to retreat and Napoleon with 95,000 troops met the corps of Gen. Friedrich Ludwig Hohenlohe, 40,000 strong, at Jena, while Louis Nicolas Davout, with 26,000 men, contained and finally routed the main Prussian corps at Auerstedt (Oct. 14, 1806). Twelve days later Napoleon was in Berlin, having shattered the myth of Prussian invincibility, and determined to punish Prussia through heavy contributions and requisitions. To strike at the Russians, he pushed east, met them in hard and indecisive clashes, the most celebrated of which was the bloody battle at Eylau (Feb. 8, 1807), and in the spring

won a decisive victory at Friedland (June 13), which led to the Treaty of Tilsit (July 7) and to a kind of reversal of alliances. Czar Alexander I, irritated by British delays in sending forces to the Continent, and seduced by the blandishments of Napoleon, whom he met on a raft on the Niemen (Neman) and who unfolded before his eyes a project of co-domination of the Continent, not only renounced the British alliance, but promised to take an active part in the Continental System. This moment may be considered the apogee of Napoleon's power.

The Continental System had been devised to stifle British economy, based on credit and exports, and by the decrees of Berlin (Nov. 21, 1806), Fontainebleau (Oct. 13, 1807), and Milan, it prohibited the importation of British goods. There was no thought that it would starve Britain into submission (at that time she imported less than 20 per cent of her wheat); but it did create a serious economic crisis in England, despite the fact that it soon became inefficient through a huge amount of contraband and a system of licenses by which Napoleon authorized trade with England for a fee. The system helped France develop her industries and some agricultural products, like sugar beets, but created in Europe an enormous amount of ill-will against French economic imperialism.

The empire extended from Hamburg to Rome, comprised 130 departments and was surrounded by kingdoms given to members of Napoleon's family: Naples to Joseph, later king of Spain; Holland to Louis; Westphalia to Jérôme; Cleves (Cleve) to Murat, Caroline's husband, and so on. In 1810, 7 kingdoms and 30 principalities were vassals of France. Even Sweden called upon a French marshal, Jean Baptiste Jules Bernadotte, to be heir to her childless king. Only Russia kept her independence. And everywhere the Civil Code, religious tolerance, and the revolutionary principles in Napoleonic garb followed French arms.

But Portugal, for a century under British influence, was a big loophole in the Continental System. In agreement with Manuel de Godoy, the corrupt favorite of the queen and the real ruler of Spain, Napoleon sent an expedition to subdue Portugal and left enough troops in Spain to dominate the country. But an insurrection in Madrid compelled the French to a ferocious repression. Guerrillas then attacked the French armies and inflicted on them their first resounding defeat in the capitulation of Gen. Pierre A. Dupont de l'Etang at Bailen (July 23, 1808). Napoleon tried to secure his rear by a spectacular but inconclusive meeting with Czar Alexander at Erfurt (September-October). He then invaded Spain, entered Madrid, took revolutionary measures in favor of the peasantry, in order to break the power of the clergy, but to no avail; and the holy war continued against the French, pushing them back slowly with the help of the duke of Wellington, whom Masséna had been unable to dislodge from his lines at Torres Vedras.

Napoleon still dreamed of universal monarchy on the Roman pattern while nationalisms were awakening everywhere, particularly in Germany, Italy, and Austria. In 1809, Austria again challenged Napoleon, who succeeded in entering Vienna, was held in check at Essling (May 22), but won at Wagram (July 5), and imposed the treaty of Schönbrunn (October 14) which gave him the Illyrian provinces. But the French forces

were showing signs of strain, and Napoleon noted a new spirit of resistance in Austria. He wanted now to establish a legitimate dynasty, and since Josephine could not give him an heir, he decided to divorce her. He could not marry his great love, the Polish Countess Marie Walewska, who, however, would bear him a son (May 4, 1810). He requested the hand of the 18-year-old Archduchess Marie-Louise of Austria and married her by proxy on March 11, and formally on April 2, 1810. The desired legitimate son, named even before his birth king of Rome, was born March 20, 1811.

Invasion of Russia, and the Abdication.—

The Napoleonic regime seemed for the moment more secure than ever. But Russia had abandoned the Continental System which was making the czar unpopular, and was almost openly preparing for war. In France, military classes were being mobilized in anticipation, a severe economic crisis was creating unemployment, taxes were growing heavier, and definite signs of lassitude and disaffection were appearing. The break with Russia came in June 1812. The czar had contrived to sign an alliance with Bernadotte of Sweden and a peace treaty with the Turks, while Napoleon was heavily engaged in Spain. Even so, Napoleon had a 3 to 1 numerical superiority against the Russians when he crossed the Niemen (Neman) on June 22. But his strategy, suited to the narrow confines of the northern Italian plains, was ineffective in the vast open spaces of Russia; his supply system, always poor, since his troops lived on the country during his short, sharp campaigns, collapsed when the Russians applied the scorched earth policy; the medical system, never too brilliant, disintegrated. Napoleon pursued the retreating Russians with a speed unequalled even in our day: Vilna, June 26; Vitebsk, July 24; Smolensk, August 16. At Borodino the Russians made a stand and a bloody battle ensued (September 7). Napoleon entered Moscow on September 14. But the city was on fire the next day, and since the czar refused to negotiate, and lack of supplies made it unfeasible to spend the winter in the city, there seemed no choice but to lead the victorious army home. The retreat began October 19. Starvation, defections, harassment by the Cossacks, the early and bitter cold, the fighting (crossing of the Berezina, Nov. 26-28), ravaged the Grand Army. When it reached the Niemen (December 14), it comprised only about 30,000 survivors; more than 500,000 men had disappeared in Russia.

It was clearly the beginning of the end, and Europe sensed it. Napoleon had left the army on December 5, leaving Murat in command, and hurried back to France, concerned over a plot of Gen. Claude François de Malet against his regime. Arriving in Paris on the 18th, he succeeded in raising another army; but officers were lacking, the generals suffered from war fatigue, and he was now overextended, with commitments from Spain to Poland and a great number of fortresses to garrison. In spite of victories at Lützen (May 2, 1813), and at Bautzen (May 21), peace negotiations came to naught, and after his setback in the Battle of Leipzig (October 16-19), Napoleon had to retreat behind the Rhine. The Allies pressed their advantage in the early months of 1814 and France was invaded. Napoleon showed his old tactical genius in that campaign, by beating one after the other the Allied columns converging upon Paris (Montmirail, Cham-

paubert, Feb. 10-11, 1814). But the jig was up for the balance of numbers was now irretrievably on the side of the Allies. On March 22 the English government announced that it would never treat with Napoleon, and eight days later the Allies entered Paris. On April 6 Napoleon agreed to an unconditional abdication. We know now with certainty (since the publication of Armand A. de Caulaincourt's *Mémoires* in 1933) that he unsuccessfully attempted suicide by poison during the night of April 12. On the 20th, he bade farewell to his troops in the courtyard of Fontainebleau.

Elba, the Hundred Days and Waterloo.—

The Allies had granted him sovereignty over the island of Elba. On the trip south he encountered hostile manifestations around Avignon, and had to disguise himself in an Austrian uniform. At Elba, he showed his old activity, reforming and reorganizing the island, but only his mother, his sister Paulina Borghese, and Marie Walewska with their son came to see him. Marie-Louise refused to come (he had seen her and their son for the last time on Jan. 24, 1814). Knowing that France was restive and dissatisfied, he escaped from Elba and on March 1, 1815, landed in France near Antibes, to begin that brief adventure known as the Hundred Days. His trip to Paris, by way of the Alpine road and Grenoble, was an incredible, exhilarating, romantic triumph. The government of Louis XVIII fled. Napoleon tried to assume the posture of the liberal heir of the revolution and of the peaceful sovereign. But Europe would not relent, nor forget her ten years of fear. War was necessary again. Napoleon invaded Belgium with the hope of defeating the Anglo-Prussian armies. When, after a few days of secondary skirmishes, he came in contact with Wellington at Mont-Saint-Jean, near Waterloo, he was unable to break the English lines and after the arrival of Prussian reinforcements, the French troops broke and could not be reorganized before Laon (June 18).

Defeated, Napoleon hurried back to Paris. Unable to gain support for further resistance, he abdicated in favor of his son. But this proposal was ignored and on July 8, Louis XVIII reentered Paris. Napoleon now decided to place himself under the protection of his greatest enemies. He boarded the British warship *Bellerophon*. "I come, like Themistocles, to claim a seat by the hearth of the British people," he wrote the prince regent. It was decided that he should be sent to St. Helena and held there a prisoner for the rest of his life. He was transferred to the *Northumberland* with his small retinue for the three months' voyage. Upon his arrival, he was at first lodged with an English family, and the episode of his good-natured friendship with their 13-year-old daughter, Betsy Balcombe, casts light on the human side of his nature. Transferred to the estate of Longwood, under the petty surveillance of Sir Hudson Lowe, he spent the time reminiscing for the benefit of his followers (Comte Henry Gratiot Bertrand; Comte Charles Tristan de Montholon; Baron Gaspard Gourgaud; Comte Emmanuel A. D. de Las Cases; his valet Marchand), writing his *Mémoires*, and in general building up the Napoleonic legend. From the end of 1819 on, he suffered from a stomach disease, now diagnosed as a gastric ulcer, from which he died May 5, 1821.

The prodigious adventures of Napoleon, giving a preview of the rise and fall of the modern

dictators, created a legend which presented him as the champion of liberalism and nationalism, and as an architect of the United States of Europe. Surrounded by an enormous aura of military glory, it was to become for the next generations a deep nostalgia which found its first expression when Napoleon's body was brought back triumphantly in 1840 and which explains the astounding success of the plebiscite of his nephew, Napoleon III, in 1851.

NAPOLEON II, son of Napoleon I. See REICHSTADT, DUKE OF.

NAPOLEON III (known as LOUIS NAPOLEON; full name CHARLES LOUIS NAPOLEON BONAPARTE), emperor of the French, nephew of Napoleon I; b. Paris, France, April 20, 1808; d. Chislehurst, England, Jan. 9, 1873. He was the third son of Louis Bonaparte, younger brother of Napoleon I, and Hortense de Beauharnais, daughter of Josephine, first wife of Napoleon I. After the final exile of Napoleon I to St. Helena (1815), Hortense took refuge at Constance, then Augsburg, and finally, in 1819, in Arenenberg Castle on Lake Constance in the Swiss canton of Thurgau. Separated from her husband, she had received custody of Louis Napoleon who, at the Augsburg Gymnasium, received an essentially German education. At 23, in 1831, he took part in an insurrection against the pope in Romagna, fell sick and was saved from the Austrians by his mother, who took him to Paris, to England, then back to Arenenberg Castle. The death of his older brother Napoleon Louis (1804-1831) in the Romagna insurrection, and of the duke of Reichstadt (q.v.), Napoleon I's only son, a year later, left him as the chief representative of the Napoleonic tradition and heir presumptive to the imperial crown. For five years he devoted himself to writing. The works of this period include *Réveries Politiques*, *Considérations Politiques et Militaires sur la Suisse*, and an artillery manual. He was made an honorary Swiss citizen and an artillery captain in the Bern regiment. On Oct. 30, 1836, he attempted a *Putsch* at Strasbourg; it failed and he was arrested and deported. After briefly visiting the United States in April 1837, he returned to Switzerland, which he left for England in the fall of 1838 to avoid a Franco-Swiss incident over his presence.

The return of the body of Napoleon I from St. Helena in 1840 caused an upsurge of the Napoleonic popularity. Louis Napoleon tried to use this popularity by fomenting another rising at Boulogne (August 5), which failed miserably. He was condemned to perpetual imprisonment and was detained for six years in the fortress of Ham in Picardy. There he read widely and wrote such books as *Fragments historiques*, and

L'extinction du paupérisme (1844). The latter reveals a socialistic utopian turn of mind; it advocates the resettlement of underprivileged families on parcels of land in order to make them self-sufficient. On May 25, 1846, he escaped by donning the clothes of a workman while the fortress was under repairs and fled to London. Three days after the outbreak of the Revolution of 1848 he returned to France, but he was requested to leave the country. On June 4 he was returned by four constituencies, but declined the election when still declared under the law exiling the Bonapartes. On September 17 he was elected in five departments and could not therefore be kept out; he took his place in the National Assembly on the 26th. During the discussions on the new constitution it was decided, upon the insistence of Alphonse M. L. de Lamartine, to have the president elected directly by the people (October 9). An amendment which would have barred Napoleon's candidacy was thought unnecessary after his lamentable, stammering defense at the tribune. But soon his propaganda was in full swing and his election came as a thunderbolt when he polled 5,400,000 votes, against 1,400,000 for Louis Eugène Cavaignac, 370,000 for the socialist, Alexandre Auguste Ledru-Rollin, and 17,000 for Lamartine—the provinces had asserted themselves and had followed the call of the Napoleonic legend.

Louis Napoleon always considered his amazing triumph as a direct, popular, democratic mandate to put an end to social unrest and parliamentary prattling and to establish an authoritarian democracy. He took every opportunity to recall the "origins of his power." But the elections of May 13, 1849, returned a strong majority of conservative monarchists who soon opposed the president, and he became hopelessly entangled in the Roman question. The latter dated back to March 1849, when the Constituent Assembly voted to safeguard the liberal institutions established in Rome by the uprising of February 9th against attempts of the Austrians and Pope Pius IX to destroy them. But the objectives of the expedition, sent according to that vote under Gen. Nicolas Charles Victor Oudinot, were completely reversed when Oudinot's troops were fired upon by the Romans. After a month's siege the French Army captured Rome on July 3, suppressed the new-born republic, and restored the temporal power of Pius IX. Thus Napoleon was trapped for 21 years into supporting a government inimical to his own democratic ideals, and later into preventing the Italians from making Rome the capital of their kingdom. Pope Pius IX, the most conservative of pontiffs, refused to be reconciled with "progress, liberalism, and modern civilization," ideas he detested, but which were the ostensible mottoes of Louis Napoleon's regime.

Through fear of the left, he was forced to lean towards the conservative Catholics, and that uneasy alliance has cast a shadow of misunderstanding upon every act of the regime. A leftist insurrection on June 13, protesting the Roman imbroglio, was easily crushed. Special elections on March 10, 1850 having returned 21 out of 31 invalidated Red deputies, a new, undemocratic electoral law was passed. Napoleon made a triumphant tour of the country, proclaiming his intentions of "saving, through order, the great principles of the French Revolution." He requested that a constitutional provision forbidding

a second term be repealed, and that the electoral law be abrogated; but both motions were rejected. Finally, on Dec. 2, 1851, a coup d'état dissolved the National Assembly, reestablished universal suffrage, and appealed to the people to support the president. There was little popular resistance, except on the 4th, when troops had to storm a few barricades. The plebiscite gave 7,400,000 ayes, 600,000 noes. The new constitution gave the chief executive a term of 10 years, authority over the ministers, and created two assemblies. The empire was restored by another plebiscite, 7,800,000 for, 250,000 against (Nov. 21, 1852). Napoleon assumed the name of Napoleon III since the king of Rome had been formally, even if ephemerally, recognized as Napoleon II. See REICHSTADT, DUKE OF.

The Second Empire.—Politically, the empire was to evolve, in the following 18 years, from an authoritarian to a liberal (1860), then to a parliamentary form (April 1870), while the opposition grew ever stronger. Economically, it was a period of expansion, fostered by the dynamism of the St. Simonians and the social interest of the emperor. Credit institutions were developed (Crédit Foncier, 1852; Mobilier, 1852; Industriel, 1859; Lyonnais, 1863; Société Générale, 1864). The railroad network was actively pushed (13,000 kilometers in the first 6 years). The capitalistic and industrial structure of France then assumed its modern form. Paris was transformed by Baron Georges Eugène Haussmann. Universal Expositions in 1855 and 1867 proclaimed the eminence of French industry and its progressive outlook. After ten years of work, a French company opened the Suez Canal on Nov. 17, 1869. Prosperity was generally high, unionism was getting its start; the rate of economic expansion of the Second Empire is possibly the fastest of French history.

Napoleon III on Jan. 30, 1853 married a Spanish beauty, Eugénie de Montijo, who gave him a son (March 16, 1856). The tone of the court was at the same time brilliant and family-like. The empress was pious, charitable, but in the later years of the empire, she exerted a dangerous influence on foreign policy. Externally, the empire was marked first by the Crimean War (March 18, 1854–March 30, 1856), in which France and England defeated Russia. Then came the Italian campaign (April 20–Nov. 11, 1859), by which Austria was compelled to cede Lombardy to Italy and France received Savoy and Nice. The expedition to Mexico began as a common Anglo-Franco-Spanish venture (October 1861) to secure the payment of public debts; but England and Spain soon withdrew their troops and only France kept an army in the country. French troops were used to support the Archduke Maximilian of Austria as emperor of Mexico from the moment of his arrival at Veracruz in May 1864. When they withdrew, his tottering regime fell under the blows of the Juaristas, and he was captured and shot at Querétaro (June 19, 1867). This expedition was a considerable strain on the French Army, and a totally futile expenditure of blood and money. A showdown with Prussia was brewing since her victory at Sadowa (July 3, 1866) against Austria. War came suddenly (July 19, 1870) as an aftermath of the Hohenzollern candidacy to the Spanish throne, and as a result of the doctoring by Bismarck of the Ems Dispatch (q.v.). The French Army was poorly led, followed obsolete tactics, suffered many reverses

(Wissembourg, Forbach), and was finally trapped with Achille François Bazaine at Metz and Napoleon at Sedan. The emperor capitulated on September 1st. On the 4th the empress fled Paris and the republic was proclaimed. Napoleon remained a prisoner of war until March 19, 1871, when he went to Camden Place, Chislehurst, where he died on Jan. 9, 1873. During the last years of his reign his sufferings from a kidney stone had broken his spirit. Eugénie survived until July 11, 1920.

Perhaps no other sovereign has been as maligned and misrepresented by political passion as Napoleon III, a victim of the fiery diatribes of Victor Hugo. But the time has come for a cool reappraisal of his aims and realizations as a Caesarian democrat and a social planner. Besides the works quoted above, see also his *History of Julius Caesar* (1865); *Letters to Prince Napoleon* (1927); *Lettres à Mmc. Cornu* (1937).

JEAN BOORSCH.

NAPOLEON, Eugène Louis Jean Joseph (known as PRINCE IMPÉRIAL), only son of Napoleon III: b. Paris, France, March 16, 1856; d. Zululand, South Africa, June 1, 1879. After the fall of the empire, he went to England with the empress and entered the military school at Woolwich. He volunteered for service in Zululand, where he was killed in an ambush.

Consult Martinet, A., *Le Prince Impérial* (Paris 1895); Filon, A., *Le Prince Impérial* (Paris 1912); Praviel, A., *La fin tragique du Prince Impérial* (Paris 1928).

NAPOLEON, PRINCE. See BONAPARTE, JÉRÔME.

NAPOLEON, city, Ohio, county seat of Henry County, on the Maumee River, 36 miles southwest of Toledo. It is served by two railroads, the Wabash and the Detroit, Toledo, and Ironton and is a marketing center for the agricultural products grown in the area. Industries include food and dairy products, metal products, tile and brick. The government is by mayor and council. Pop. (1950) 5,335.

NAPOLEON, a former piece of French money valued at about \$4 or 20 francs. See LOUIS D'OR.

NAPOLEON LE PETIT (*Napoleon the Little*), the title of Victor Hugo's savage satire on Napoleon III (Brussels 1852).

NAPOLEON'S TOMB, the burial place of Napoleon Bonaparte under the dome of the Invalides in Paris. It has the form of a circular crypt 20 feet deep and 36 in diameter, open at the top. The tomb was designed by Ludovico Tullio Visconti, and on the walls are 10 marble reliefs by Pierre Charles Simart. The sarcophagus is 13 feet long, 6½ feet wide, 14½ feet high, cut from a single block of red porphyry, 67 tons in weight, surrounded by 12 victories by James Pradier. The inscription above the entrance to the crypt is taken from Napoleon's will: "I de-

sire that my ashes shall rest on the banks of the Seine, in the midst of the French people that I have loved so well." Two adjoining tombs are those of the emperor's friend, Géraud Christophe Michel Duroc, and his companion, Henri Gratien Bertrand. Napoleon's remains were brought here in 1840 from St. Helena. In December 1940 the Germans reburied his son, the king of Rome (1811-1832), in an adjoining chapel.

NAQUET, ná'kă', **Alfred Joseph**, French chemist and social reformer: b. Carpentras, France, Oct. 6, 1834; d. Paris, Nov. 10, 1916. In 1867 he lost his professorship in the faculty of medicine in Paris and was condemned to 15 months' imprisonment for his share in the activities of a secret revolutionary society. In 1866 he fled to Spain after the publication of his book, *Religion, propriété, famille*. He returned to France in September 1870 and in the revolution became secretary of national defense. Soon after he was elected to the Chamber of Deputies and began agitation against the French marriage laws. His agitation for the re-establishment of divorce resulted in the law of 1884, and in 1886, through his continued efforts, divorce became legal after three years of definite separation, on the demand of one of the parties concerned. He was the author of a number of books on chemistry, the divorce question, and economic and political problems.

NARAKA, nŭr'ă-kă, in Hindu theology, a term equivalent to the English word hell. In Naraka there are 28 divisions, in which sinners of as many different classes are confined and subjected to tortures corresponding to the gravity of their offenses.

NARBADA, nĕr-bŭd'ă, or **NERBUDDA** (ancient NAMADOS), river in central India, about 775 miles long, rising in the mountains near the border of Madhya Pradesh and Vindhya Pradesh. It flows generally west and west-southwest across north Bombay Province and enters the Gulf of Cambay below Broach. Only about 60 miles of its lower course are navigable. The river is sacred to the Hindus, who make pilgrimages to its banks at Suklatirtha, Marble Rocks, Nemawar, and Amarkantak.

NARBONNE, năr-bŏn', France, the chief town of an arrondissement in the Department of Aude, in a beautiful hill-girt plain, eight miles from the Mediterranean and 31 miles east of Carcassonne, commanding the entrance into Spain by the southwest. It is of historical interest as the Roman Narbo Martius, reputedly the earliest Roman colony (118 B.C.) beyond the Alps. About 309 A.D. it became the capital of Gallia Narbonensis, and had its capitol, forum, theater, aqueducts, and triumphal arches, of which there are few remains. In 412 (A.D.) it was taken by the Visigoths, and in 719 by the Saracens, from whom it was recovered by Pepin in 759. During the 11th and 12th centuries it was a prosperous manufacturing city, but subsequently deteriorated owing to the silting of its harbor. Its port, La Nouvelle, is 13 miles distant by canal. The principal edifices are the 12th and 13th century Romanesque church of Saint Paul Serge; the unfinished cathedral of Saint Just (13th-15th century); and the former archbishop's palace, now the city hall, in which are a good museum and a picture gallery.

A seminary and hydrographical school are among its educational institutions. The white-heather honey of Narbonne maintains its ancient celebrity; wine is produced, chiefly for blending purposes. The manufacture of bricks and tiles, sulphur refining, cooperage, and the distillation of brandy are among its industries. Pop. (1946) 26,301.

NARCISSISM, nār-sis'iz'm, in orthodox psychoanalysis, an intense degree of self-love. The sexual instinct is directed towards one's own body or psychological attributes. By corollary, the narcissist is indifferent to other persons, unless by attracting their favorable attention his self-admiration is proportionately enhanced. The libido (sexual energy) is directed solely upon the self, or, in psychoanalytic terms, is "cathected" to the self. Narcissism is the primitive counterpart of egotism. It is contrasted with libidinal cathexis towards other persons. The psychoanalyst believes that a narcissistic individual is incapable of bestowing love upon anyone other than himself. In certain forms of mental disorders extreme narcissism is said to occur, and a mild degree of self-love is said to be present in many psychological functions.

Psychoanalysts differentiate between primary and secondary narcissism. Primary narcissism is normal among young infants, who find autoerotic gratifications in their own bodies. Secondary narcissism Freud defined as that which occurs when love-objects are taken away or when the libido is redirected from the external objects or persons toward which it has been flowing. Various psychopathologies eventuate from the latter type of narcissism.

PHILIP HARRIMAN.

NARCISSUS, nār-sis'ūs, in Greek mythology, the son of the river god Cephissus. Narcissus was of surpassing beauty, but excessively vain and inaccessible to the feeling of love. Echo pined away to a mere voice because her love for him found no return. Nemesis determined to punish him for his coldness of heart, and caused him to drink at a certain fountain, wherein he saw his own image, and was seized with a passion for himself. As a result, he pined away, and the gods transformed him into the flower which still bears his name. See also ECHO.

NARCISSUS, a genus of plants of the family Amaryllidaceae (q.v.). The species, numbering from 16 to about 50, according to different authors, have bulbous roots, narrow grass-like leaves, and generally white or yellow flowers borne singly or in small clusters and protruding from a dry spathe at the summit of a leafless scape. Because of their hardiness, ease of cultivation, habit of blooming in early spring, beauty and fragrance, many of the species and their numerous hybrids and varieties have been general garden favorites for centuries. Some are useful for winter forcing, especially the polyanthus narcissus (*N. tazetta*) with its popular forms the paper white and the Chinese sacred lily. In general, the garden species succeed best in well-drained garden soil of medium texture and richness. The bulbs should be planted in autumn

about five inches deep and three inches apart, and should not be disturbed until they appear to be failing, perhaps after three years. Then when the foliage has died down the clumps may be dug, the bulbs divided, cleaned and stored in a cool dry place until planting time. Among the most popular species are the poet's narcissus (*N. poeticus*), also known as pheasant's eye, the jonquil (*N. jonquilla*), and *N. tazetta* mentioned above. The Lenten lily (*N. pseudo-narcissus*), or daffodil, is also one of the most widespread and hardy. See also DAFFODIL.

NARCOSIS, nār-kō'sis, a state of profound stupor, unconsciousness, or arrested activity. The condition is produced by the action of one or more of a large list of drugs known as *narcotics*.

NARCOSYNTHESIS, nār-kō-sin'thē-sis, a form of treatment used in psychoaneuroses, especially in what is known as the war neuroses. One of the sleep-inducing drugs is injected intravenously into the patient, to produce stupor or arrested activity. In successful cases this brings forth emotionally charged conversation in which the patient unburdens his mind. The discussion ensuing is known as *synthesis*.

NARCOTICS, nār-kōt'iks, drugs which produce stupor, complete loss of consciousness, or sleep. These are divided into 3 principal groups, the opium group causing sleep, the belladonna group which produces illusions and delirium, and the alcohol group which brings on exhilaration and exaltation, followed by sleep. Narcotic drugs should be distinguished from *hypnotics* such as the barbiturates, amytal, etc., which produce sleep only. The more important narcotics are opium, morphine, codeine, belladonna, hyoscyamus, and hyoscine (scopolamine). Most are habit forming and are given in medicinal doses to relieve pain and induce sleep. In large doses they may produce coma and if the dose is sufficient death results. Even including ethyl alcohol all narcotics should be regarded as dangerous drugs not to be taken in poisonous amounts. This is especially important since tolerance for a drug has wide variation in different individuals. In the case of children even moderate doses may produce alarming symptoms with depressed respiration which, if not treated promptly, may result fatally.

HAROLD WELLINGTON JONES, M.D.

NARCOTICS, Traffic and Control. The problem of narcotics traffic and control is complicated by the dual nature of these substances. They are indispensable to surgery because of their pain killing and other properties and at the same time they can become the source of a terrible social evil—drug addiction.

Narcotic drugs have been in the past and are still to a very large extent extracted from plants: the opium poppy, the coca shrub, and the cannabis. The first two grow only in a limited number of countries—"the producing countries." The countries in which the alkaloids of opium and coca are extracted are "the manufacturing countries." Most countries are neither "producing" nor "manufacturing." In recent years a new complication has occurred in the problem of narcotic drugs; the rapid development of synthetic narcotic drugs which contrary to the "natural" narcotics derived from agricultural plants can be extracted from a wide range of other raw ma-

terials. The role of the national and international authorities in the field of narcotic drugs has been to create rules by which the production would be made to coincide with the scientific and medical needs: the distribution should be proof against leaks to the illicit traffic and illicit traffickers would be tracked and prosecuted.

Historical Development of the Control.—

Since opium smoking used to be the most important form of drug addiction before the discovery of manufactured narcotics, the control began with attempts to suppress it. In 1909, on the initiative of President Theodore Roosevelt, an international opium commission was convened at Shanghai and recommended the gradual suppression of opium smoking. The government of the United States proposed to convoke a conference which met at The Hague in December 1911 and adopted on Jan. 23, 1912, a convention formulating the basic principles for the control of narcotic drugs: control of the production of opium, limitation of manufacture, sale, use, etc., of narcotics to medical and scientific needs.

After World War I the control became the responsibility of the League of Nations which established a policy making body formed of representatives of governments: the Advisory Committee on Traffic in Opium and other Dangerous Drugs. That body was to study the problem and propose the measures that it deemed necessary in order to solve it.

Under the auspices of the League two very important conventions have been signed (and are still in effect) in which the principles of The Hague Convention are put into practical application. (1) The Convention of 1925 provides for a tight control of the legal international trade in drugs by creating a system of import certificates and export authorizations such that no amount of drugs may be exported or imported without the knowledge and control of the governments of the countries of both parties to the transaction; by establishing the Permanent Central Opium Board to keep watch over these transactions (each government has to furnish to the board periodical reports on the consumption and movement of drugs on to and from its territory). In cases where the board feels that there is a dangerous situation developing in a country, it can ask for explanations and even recommend an embargo of narcotics for that country. (2) The Convention of 1931 aims to limit the production and to regulate the distribution of manufactured narcotics. It establishes a system of estimates by which each country has to tell each year the amount of narcotics it needs for the following year. These estimates are binding and determine the maximum amount to be imported or manufactured. They are examined by a special body, the Supervisory Body, which can ask for explanations, recommend modifications to the estimates, and establish them for the countries which fail to furnish them. The convention also sets up a procedure for placing new drugs derived from opium or coca leaf under international control following a decision of the World Health Organization (under the League of Nations such decisions were made by the League of Nations Health Committee together with the Office International d'Hygiene Publique in Paris).

These two conventions are the most important of a group of international instruments aiming at controlling the use of narcotic drugs. During World War II the control was maintained in spite

of the obvious difficulties and when the United Nations Organization was set up it took charge of the functions of the League of Nations in the field of narcotics: the administrative bodies (Permanent Central Opium Board, Supervisory Body) remained unchanged and the policy-making body became the Commission on Narcotic Drugs of the Economic and Social Council (15 nations represented). Under the new setup two important agreements have been concluded: the Protocol of 1948 which provides for control of the new synthetic drugs; and the Protocol of 1953 for the limitation of the production of opium, according to which opium will be produced only for medical and scientific needs and the right to export it will be limited to seven "producing countries" (Bulgaria, Greece, India, Iran, Turkey, USSR, and Yugoslavia).

Present State of the Legal Trade.—Each year the Permanent Central Opium Board publishes its report on the legal world trade in narcotics, based on the statistics furnished by the different governments. That report shows the following figures for the production of narcotics in 1952: raw opium, 1,067 tons; morphine, 75.7 tons (222 per cent of which was manufactured not from opium but from poppy straw); diacetylmorphine (heroin), 120 kilograms (kg.) (heroin is derived from morphine and has been manufactured legally in 1952 by five countries); codeine (codeine is derived from morphine), 63.8 tons; cocaine, 2.14 tons; pethidine, 12 tons; methadone, 381 kg. (figures incomplete; production in 1951, 521 kg.)

The main producing countries were (in order of importance): opium—Turkey, India, Iran, USSR, and Yugoslavia (there is only fragmentary information available concerning the situation in the mainland of China in 1952 but it is to be assumed that even if the production of opium is forbidden, that country is still probably by far the most important producer). Morphine—United States, United Kingdom, USSR, Hungary, Germany, and France. Cocaine—United States, United Kingdom, France, and Germany. The countries manufacturing morphine, cocaine, etc., buy the raw material from the countries producing it and export the drugs to all the countries of the world. The importance of the consumption generally corresponds more or less to the amount of population of each country.

Illicit Traffic.—The illicit traffic in narcotics is closely linked with the existence of drug addiction. An important incentive for illicit traffic is the fact that addicts who are ready to pay high prices for drugs, the legal consumption of which is forbidden, have no medical prescription. The more organized the control the more so the illicit traffic and the higher the prices. The traffickers can get their material from licit or illicit sources. Licit—that is, from legitimate sources by robbery (for instance, at the end of World War II important stocks of the German Army were pillaged); by forgery of medical prescriptions (but it is mainly the individual addict who resorts to that method and then it is for his own consumption); or by misappropriation of drugs legitimately produced (as has been the case in 1951 and 1952 in an important factory manufacturing heroin in Italy).

Illicit Sources.—These are probably by far the most important. Opium poppies or cannabis are illicitly produced in an inaccessible part of a country or in a country where the control is not

very well organized (for instance, in the north-western states of Mexico in the years 1946-1950). The raw material is then either processed on the spot or sent to clandestine laboratories where morphine or heroin is produced (for instance, in 1952 five such laboratories were discovered by the police in France). Once the material is ready, the traffickers who are organized in powerful gangs with international ramifications will try to sell it where it will fetch the highest price. The two countries which seem to be, probably because of their hard currency, the main destination of the traffic are the United States and Canada. When the material has been delivered, it is "cut"—that is adulterated with other substances (heroin is usually cut up to 90 per cent before it is sold to the addicts), then distributed to wholesale peddlers who in turn sell it to the "pushers" who are in direct contact with the addict. In that way an ounce of heroin which cost \$30, for instance, will be sold for as high as \$500.

It is obvious that the volume of this traffic cannot be known. However, it is generally thought that the amount seized by the customs or other authorities represents about 10 per cent of the total quantities. It is of interest to quote a few figures of the total of some of the narcotics seized in the world during one year (1948, figures in kilograms): opium, 12,923; prepared opium, 4,444; dross, 15; morphine, 24; heroin, 30; cocaine, 19; cannabis (marihuana and other products of Indian hemp), 80,297. There seems to be a certain geographical localization for the drugs: Asia is the country of opium, Africa of Indian hemp, and North America of the "white drugs," as is clearly shown by the following figures: 75 per cent of the opium seized in the world was seized in Asia; 85 per cent of the cannabis products in Africa; and 65 per cent of the heroin in the United States (about 28 kilograms).

The routes of the illicit traffic are very often complicated. In order to evade suspicion, the traffickers will plan an indirect route so that their material will reach its destination on a ship coming from a port from which there is no reason to think that narcotics could come. Such a route was discovered in 1947, reaching the United States from Turkey by way of New Caledonia. The main routes are by sea, but of course there are land routes between neighboring countries: Syria-Israel-Egypt, the "Burma Road," the Mexican-United States boundary, etc. Since World War II the traffickers have begun to use air routes, parachuting narcotics at a given point through the complicity of crew members of an airplane. The traffickers are well organized and very alert; moreover, the huge profits derived from a shipment are sufficient to compensate for the loss of many others. They have perfected literally hundreds of ways of concealing their wares; from the stomach of a camel to semisubmersible containers provided with the latest gadgets (they are dropped outside territorial waters at a given point, stay under water for—say—two days, then pop up and emit short wave radiations which are picked up by a waiting boat).

Conclusion.—Society in order to protect itself prohibits the use of narcotics for nonmedical purposes; an international machinery has been designed to ensure that narcotics will be produced and used for medical purposes only. However,

the addicts want their drugs, and the traffickers supply them, taking risks and profits. Against them each nation uses its own defense forces: customs, police, special narcotics administration (in the United States the Bureau of Narcotics, a federal agency which has the responsibility of enforcing the special narcotics legislation). Besides, through the international agencies the nations work together in order to stop the illicit traffic. Apart from the international setup previously analyzed there is the collaboration of the different police forces directly or through the International Criminal Police Commission.

The results of the control have been more than satisfactory. Since the beginning of the 20th century, drug addiction has been tremendously reduced and the illicit traffic has decreased regularly. If the figures of seizures for 1948 are compared with those for 1936 the drop is obvious: 124,497 kilograms (kg.) of opium seized in 1936 compared with the 12,923 kg. in 1948; 867 kg. of heroin seized in 1936 compared with 36 kg. in 1945, etc. Thus through national and international efforts a terrible potential evil is slowly and surely defeated.

NARCOTINE, nār'kō-tēn, an alkaloid of opium. It is present in opium to the extent of 0.5-10 per cent, according to the source, and is isolated after the morphine and codeine have been removed. It has the formula $C_{20}H_{27}NO_7$ and belongs to the isoquinoline types; it is closely related to hydrastine, differing only by an additional methoxyl (OCH_3) group. The principal use of narcotine is in the preparation of cotarnine, which is formed when the molecule is split by oxidative hydrolysis. Cotarnine, in the form of its salts, is of considerable value as a styptic agent.

NARDINI, nār-dē'nē, **Pietro**, Italian violinist and composer: b. Leghorn, Italy, April 12, 1722; d. Florence, May 7, 1793. He studied the violin first in Leghorn, then in Padua with Giuseppe Tartini, becoming his teacher's most successful pupil. In 1753 he was chosen for the post of solo violinist at the court of the duke of Württemberg in Stuttgart, where he remained until 1767. After his return to Italy, he became in 1770 musical director at the court of Grand-duke Leopold of Tuscany in Florence. Nardini was not only a great performer, admired for the exceptional purity of his tone, but also a gifted composer of chamber music. He wrote six concertos for violin and orchestra, 15 sonatas for violin and bass, six string quartets, six duets for two violins, and six trios with the flute. Some of his sonatas are still included in the repertory of great violinists. The sonatas were re-edited by J. D. Alard and by Ferdinand David.

NARDO, nār-dó', town and commune of Italy, in the Province of and 15 miles southwest of Lecce, in Apulia, six miles from the Gulf of Taranto. Situated on the railroad from Lecce to Gallipoli, in the heel of Italy, it is a busy trade center for wine, olive oil, and cereals, the chief products of the area. There are several baroque churches and houses, but the most notable construction is the cathedral, founded by the Benedictines in 1090, which was later enlarged and restored.

Neritum was an ancient town of the Messapii, later a Roman municipium. After the fall of

the Roman Empire it came under the Byzantines; Greek influence remained so strong here, that the Greek rite of the local churches was entirely Latinized only in the 15th century. Nardo was sacked by the Saracens in 901 and conquered by the Normans in 1055. It was a fief of several lords and witnessed long and fierce struggles. Pop. of the commune (1951) 26,223.

NAREW, *nā-rēf*, river in northern Poland rising in the district of Grodno out of the swamps of Byelovyezh and becoming navigable near Tikozyń, it flows past Lomża and Pultusk entering the Bug below the latter town. It has a length of 271 miles. The Niemen is connected with this river by the Augustowo Canal.

NARIAKI, *Daimyo*, of Mito, a member of the Gonsanké, or three princely Tokugawa families of Kiushiū, Owari and Mito, who ranked first among the territorial nobility of Japan. He flourished in the middle of the 19th century, and was noted as the leader of the seclusion policy of Japan. While working hard to improve the military and educational systems and to stir up her warlike spirit which the long years of peace had greatly diminished, he recognized that his country must soon be called upon to take her place among the nations of the world, yet he deliberately proclaimed the doctrine of the seclusion of Japan, in the meantime working strenuously to transform Japan along the lines of the very civilization and culture he pretended to be fighting. Nariaki's personality was the strongest and his intelligence the keenest, in his day, in Japan, and he soon was able to make his cry of the "expulsion of the barbarians" that of the whole country. History shows that he was, by far, the best informed man in his day, in Japan, on "foreign ways." He fully appreciated the importance of providing Japan with the armaments and sciences of the western nations; and as early as 1849 he had begun spending comparatively large sums of money in the manufacture of arms along the latest European models. Against all opposition he prepared Japan for her wonderful leap into the arena of western civilization, while all the time he was misunderstood at home and abroad. Consult Okuma, Count Shigénobu, 'Fifty Years of Japan' (English trans. by Marcus B. Huish, London 1909).

NARINO, *nā-rēño*, **Antonio**, Colombian politician: b. Bogota, Colombia, 1765. d. Leiva, Colombia, 13 Dec. 1823. He was educated in the college of San Bartolome in Bogota and entered the magistracy. His writings of a revolutionary character brought him into trouble and in 1795 after a tedious trial he was transported to Spain under sentence of 10 years' penal servitude. Escaping in 1797 he returned to his own country but was again imprisoned and not released until the Revolution of 1810, when he joined the patriot army. He was elected President in 1811 and later dictator. On the outbreak of civil war Nariño defeated the Federalists, and then resigning his dictatorship marched against the Royalist forces in the south. His success was followed by defeat at Pasto in 1814 when he was captured and sent a prisoner to Spain. He was held a prisoner until 1820 when he returned to his own country. In 1821 he was elected senator, but declined the

vice-presidency in 1822, and ill-health compelled him to retire soon after his appointment as commander-in-chief in 1823.

NARNI, *nār'nē*, Italy, town known to the ancients as Nequinum and later as Narnia. It is located in the province Perugia on a cliff beneath which, in a deep ravine, flows the Nera (the ancient Nar). It is on the Rome-Foligno Railway, is seat of a bishop and has a cathedral dating from the 11th to 15th centuries, besides other churches erected from the 9th to the 15th century. Here are also ancient dwellings and castle, a town-hall dating from the 13th to 16th century, strong remains of a Roman bridge (of Augustus), an ancient aqueduct, etc. Its industries number leather and rubber-ware factories and oil presses. This is the birthplace of the Emperor Nerva and of Pope John XIII. Pop. 12,943.

NARO, *nār'ō*, Italy, town in the province Girgenti, Sicily, on the coastal river Naro, 12 miles from Girgenti. It has a castle dating from the Middle Ages and Early Christian catacombs. In the vicinity are large sulphur pits. The population is about 13,000.

NARRAGANSETT (*nār-a-gān'sēt*) **BAY**, an inlet of the Atlantic Ocean, extending into the State of Rhode Island about 28 miles. At its entrance, from Sakonnet Point to Point Judith, the bay is about 8 miles wide. One of its channels, on the east, is called Sakonnet River, and the chief arms of the bay are on the east, Mount Hope Bay, on the west, Greenwich Bay. The principal rivers which enter the bay are, at its head, Providence River, from the east Taunton, from the west Pawtuxet. The largest island in the bay is Rhode Island, and others are Conanicut, Prudence and Hog. Several places of importance are on the shores of the bay, chief of which are Providence at the mouth of the Providence River, Newport on Rhode Island and Fall River, at the mouth of the Taunton. Narragansett Bay is of great importance to the State, as it gives opportunities for commerce and transportation. The first explorers of the northeast coast of the United States mention this bay. Consult Bacon, E. M., 'Narragansett Bay' (New York 1904).

NARRAGANSETT INDIANS, an American tribe formerly occupying the territory now comprised in the State of Rhode Island and the eastern part of Long Island. Shortly after the arrival of the pilgrims they manifested symptoms of hostility; and as an expression of sentiment Canonicus, their chief, sent to Plymouth a bundle of arrows wrapped in the skin of a rattlesnake; to which Bradford, the governor, replied with the same skin filled with powder and shot. This significant retort secured, if not the good-will, at least the peaceableness of the sagacious chief. In the Pequot War they aided the colonists, but not unanimously. In the winter of 1675, during King Philip's War, that chief having taken refuge with the tribe, the colonists, apprehending that they would join his cause, made a secret attack upon their principal fort, killing about 1,000 warriors, destroying all their provisions, and exposing those who escaped to cold and famine, of which very many died. The Narragansetts from this time waged incessant war with the whites. They have now entirely disappeared as

a race, although some of their descendants of mixed blood are to be found in one or two localities in Rhode Island.

NARRAGANSETT PIER, village, Rhode Island, in Narragansett Township, Washington County; altitude 11 feet; on open ocean near the mouth of the West Passage to Narragansett Bay; about 30 miles south of Providence; served by the Narragansett Pier Railroad (connections with the New York, New Haven, and Hartford Railroad at Kingston). Narragansett Pier is best known as a beach resort, though some farming and fishing is done in the region. There are several beaches in the township, both public and private, as well as numerous inland ponds affording saltwater fishing. North of the village is the exclusive Dunes Club; to the south, Scarborough Beach, state-owned and operated. Further south, approximately six miles, is Point Judith, one of the most dangerous spots along the Atlantic Coast. Narragansett Township did not come into existence as a political unit of Rhode Island and the Providence Plantations until 1901, though its reputation as a beach resort area dates from the middle of the 18th century. It was a district of South Kingston from 1888 until its incorporation as a separate township in 1901. Pop. of the village (1950) 1,247.

NARRATIVE POETRY. The telling of a story in verse is in modern times rather exceptional than normal, owing to the extraordinary rise in importance of prose fiction. But in early periods narrative poetry was the most abundant and important kind, owing to the primitive tendency to devote poetry largely to objective purposes, in contrast with the subjective tendency of modern poetry. For the various types, see under LITERARY FORMS.

The Ballad.—In general this is the most primitive type of narrative poetry, and is assumed to have existed among practically all peoples, though in many instances no early examples have survived. This proportionately large disappearance of early ballads is due to their belonging to the period of oral composition and transmission, as distinguished from that of written literature; and this oral element is the fundamental characteristic of the type. It is connected, too, with the element of song; for the primitive ballad may always be assumed to have been sung. A surviving evidence of this is the frequent appearance of a refrain, perhaps originally joined in by the whole company of persons present at the ballad singing. Closely connected with these characteristics is the communal spirit of the old ballad: the form arises from a state of society when the individual poet is of relatively slight importance and when the content of poetry is not the experiences and feelings of the individual singer but those of the group. Hence in the ballads we do not look for individuality of style; of this their universal anonymity is a sign. Their language is simple, unsophisticated, but conventional, marked by abundant repetition yet by rapidity of narrative method,—in a word, the language of an age, as Ten Brink put it, whose poetry is "oscillating perpetually between reminiscence and improvisation." Very many of the ballads, if not all, had their origin in the versifying of a real fact, gathering up mythical elements in

the manner of popular tradition. Often there are many different versions of the same story, some differing only in details, others in essential elements, such as changes from supernaturalism in the direction of realism, or variants characteristic of particular localities or social groups.

Of ancient ballads of Greece and Rome no remains survive, though evidence of their nature is thought to be traceable in elements of the ancient epics. Macaulay, in his 'Lays of Ancient Rome,' made a brilliant but rather sophisticated attempt to conceive the matter and spirit of ballads of the early Roman people. Of the Latin races the Spanish branch has preserved the greatest number of ballads, some of those still extant dating from the early 11th century; most famous are those concerned with the story of "the Cid," in the 12th century. Of French balladry the remains are more fragmentary. The early Germans are known to have made abundant use of ballads, and a collection of them was made under the direction of the Emperor Charlemagne; a surviving fragment of a "Hildebrand song" is supposed to date from the 8th century. Later, in the 15th and 16th centuries, a new era of German balladry developed; and toward the end of the 18th century modern scholars, led by Herder, began the systematic collection of the ballads of the race. There are also rich remains of the ballads of the Scandinavian peoples, dating from the 11th, 12th and 13th centuries; a collection was made in Denmark as early as 1591, while one of the greatest of modern ballad collections is that of the Danish scholar Grundtvig. The Slavic peoples have preserved an abundant ballad tradition, and some of them, notably the Serbians, are to this day in the ballad-making and ballad-singing period. Of the early English ballads no remains are preserved; but there are numerous survivals of the mediæval and modern periods of ballad-making, both in Scotland and England, beginning perhaps in the 13th century and extending as late as the 18th. The Robin Hood group includes the most famous of these,—a cycle thought to have originated in the 13th century. A monumental collection of the English and Scottish ballads was made by the American scholar F. J. Child.

The revived interest in balladry characteristic of the romantic movement in the late 18th century led to the writing of various modern adaptations and imitations, of which one of the most famous is the German poet Bürger's ballad of 'Lenore,' which was translated by Walter Scott. Wordsworth and Coleridge also adapted the ballad form to two different types of narrative verse found in their volume of 'Lyrical Ballads' (1798),—types represented respectively by Coleridge's 'Ancient Mariner' and Wordsworth's 'Lucy Gray.' Finally, one must note the distinction between these ballads which in one way or another hark back to the old folk poetry and the so-called ballad which is characteristic of the age of printing, and was abundantly produced, in doggerel verse, in the 16th and 17th centuries; these compositions, which are usually destitute of literary value, are sometimes called "broadside ballads," from the most common form of their printing.

The Epic.—This type may be viewed as an elaboration of the ballad, developing similar

material more formally and at greater length, and representing a state of society more highly organized, socially and politically. Frequently a definite racial or national spirit underlies the epic, its subject, as Hegel expressed it, being some action which "includes the whole life of a nation and the history of an epoch." Like the primitive ballad, the primitive epic belongs to the period of oral transmission, but is associated with recitation rather than song, and with the art of professional entertainers, such as the German *scop* and the French *jongleur*. In some of the more elaborate ballads, notably the expanded ballad called 'A Gest of Robin Hood,' one may see something of the transition to epic elaboration and individual art-composition; and certainly when we reach the full epic form, though it is still representative of communal material and interests, we recognize the skill of highly developed individual workmanship, giving unity and form to great masses of material. It is customary to distinguish between the folk-epic, based originally on ballad tradition, and showing comparatively little of the spirit of the individual artist, and the art epic, consciously and imitatively developed by a poet of a literary age. Of the former the conventional example is the Greek 'Iliad' of Homer, dealing with the hero Achilles and the Trojan War; of the latter, the Roman 'Æneid' of Virgil. But the distinction cannot be maintained with accuracy, since there is indefinite gradation from the communal to the individual method. Thus the Greek 'Odyssey,' on the wanderings of Ulysses, which is traditionally attributed to the same poet as the 'Iliad,' shows far less of the national and communal, and more of the individual, spirit. Other epics of the more or less primitive type are the 'Mahabharata' of India, based on the mythologic legends of the Hindu people; the German stories of the 'Nibelungen' and 'Gudrun,' dating from the 13th century; the French *chansons de geste*, or heroic songs, abundant in the 11th and 12th centuries, of which the chief is the 'Song of Roland'; the Spanish 'Poem of the Cid,' of the 12th century; and the old English 'Beowulf,' in its present form dating from the beginning of the 8th century, but representing an earlier period and Scandinavian rather than English matter. The old Norse lays of the 'Elder Edda' approximate epic form, but in unity and elaboration the prose 'Saga of the Volsungs' is nearest, for the Scandinavians, to the true epic. Epics half way, in a sense, between the primitive and the sophisticated type, are the Indian 'Ramayana,' the Persian 'Shah-Nameh' (made by the court poet Firdausi from primitive epic material), and the Finnish 'Kalevala' (compiled by the modern philologist Lönnrot). To the same hybrid class belong the partly compiled, partly composed Celtic 'epics' of James Macpherson, 'Fingal' and 'Temora' (1762-63), based on more or less genuine materials from the Scottish Highlands, attributed to a traditional bard named Ossian.

The imitative or art epic has been well represented in every literature which came under the influence of the classical tradition. For Greece itself there was a considerable number of these poems, commonly called the "epic cycle," whose authors undertook to complete the epic treatment of national material left untouched by Homer; and, in the Alexandrian

age, the 'Argonautica' of Apollonius of Rhodes. For Rome, as we have seen, the great example is the 'Æneid,' which remains the most successful reproduction by art of the spirit of the folk epic; for Virgil celebrated a theme of national significance at the moment when the national life of the Romans was at its height. Later Roman epics were the 'Pharsalia' of Lucan and the 'Thebais' of Statius. In the mediæval period the epic form, like all literary forms, was turned to the service of the Church, and there was a considerable production of Christian epics, beginning with the 'Historia Evangelica' of Juvencus, in the 4th century. Highly characteristic, too, of this era are narrative poems of allegorical or symbolic type, having something of the dignity and elaboration of the epic but without its usual themes or methods; one may note examples as different as the great 'Divine Comedy' of Dante and the English poem of 'Piers Plowman.' The Renaissance was followed by various experiments in formal epic, such as the 'Lusiad' of Camoens in Spain (1572) and Tasso's 'Gerusalemme liberata' (1581) in Italy. In the 18th century Voltaire attempted to revive the glory of the form in his 'Henriade' (1723). In Germany the most notable modern epic is Klopstock's biblical 'Messias' (1773); there is also a 19th century version of the Nibelungen epic by Wilhelm Jordan. In England the Renaissance poets were rather less interested in the epic than those of the Continent, though Spenser doubtless regarded the allegorical narrative of his 'Faery Queene' (1590-96) as in the epic tradition; and the same thing is true of historical poems like Warner's 'Albion's England' (1586), Daniel's 'History of the Civil Wars' (1595), and Drayton's 'Mortimeriados' or 'Barons' Wars' (1596, 1598). It was reserved for Milton to make the only really vital application to English poetry of the old epic method, in his 'Paradise Lost' (1667), a work dealing with the supreme conflict of the whole human race instead of a special branch of it. Cowley had already produced a biblical epic in the 'Davideis' (1656), and Davenant an historic epic in the 'Gondibert' (1651),—both highly praised in their time, but now considered unreadable. Equally lacking in vitality were the English epics of the 18th century, such as Blackmore's 'Alfred' (1723); Glover's 'Leonidas' (1737), and Wilkie's 'Epigoniad' (1757); on the other hand the taste of this age for the epic form found expression in Pope's famous translation of Homer. In the early 19th century the epic method was revived by Southey in a series designed to represent the great religions of the world: 'Thalaba,' 'Madoc,' 'The Curse of Kehama,' and 'Roderick' (1801-14). The taste of the modern period, however, turned very definitely either to romance or realism, both of which found expression in Byron's great satiric-romantic-realistic epic of 'Don Juan' (1819-24). Something of the old epic method was again revived by Tennyson for his rather mysteriously termed 'Idylls of the King' (1859-85), and—with far more regard for the primitive tradition—by William Morris in 'Sigurd the Volsung' (1876). But the finest example in modern poetry of classical epic style is found in the episodic 'Sohrab and Rustum' of Matthew Arnold (1853),—a version of a brief

portion of the Persian 'Shah-Nameh.' Once more, at the opening of the 20th century, a vigorous effort has been made to revive the national epic, in the 'Drake' of Alfred Noyes.

Finally, we may note that in every period there have been burlesque or satiric epics, taking their point from the very dignity of the traditional form in contrast with the triviality or meanness of its new application; such are the ancient Greek 'Battle of the Frogs and Mice,' Butler's 'Hudibras' (1662); Boileau's 'Lutrin' (1674), and Pope's 'Rape of the Lock' and 'Dunciad' (1712 and 1728).

The Metrical Romance.—This type of narrative poem is especially characteristic of the mediæval period, or, more generally, of the age of chivalry as distinguished from that of primitive heroic life and literature. Between many of these poems, however, and the epic, the line is a very doubtful one. The greatest representatives of the type are found in Chrestien de Troyes, a *trouvère* of France in the late 12th century, and two German poets of the early 13th century, Gottfried of Strassburg and Wolfram of Eschenbach, of whom the former rewrote the story of Tristan and Isolde and the latter the story of Parsifal. But besides these, in every country of western Europe, there were uncounted nameless authors both of individual poems and of those which go to make up the great "cycles" like those of Arthur, Tristram, Gawain and other popular heroes. It is common to divide these romances according to the geographic source of their material, which is thus classified as "Matter of France," "Matter of Britain" (that is, the primitive Celtic region, whether continental or insular), "Matter of the Orient" etc. But in the actual authorship and distribution of the romances, linguistic, racial and geographic lines play comparatively little part, a good portion of them having become the property of all the European peoples of their age. Like the epic, these romances represent the age of recited poetry and of professional entertainers; Scott's 'Lay of the Last Minstrel' at once describes the type and exemplifies the way in which he came to pass from the study of the early romances to the writing of modern originals. In England the finest of the romances are as late as of the 14th century; notably, for the more popular sort, the 'Sir Gawain and the Green Knight' of a genius whose name has been lost, and for the more literary, the 'Troilus and Criseyde' of Chaucer, in which a familiar episode of the old Trojan war story is treated with an interest in characterization and in realistic humor which make it anticipatory of the modern novel. On the border, again, between the mediæval and the modern spirit was the popular Italian romance of the Renaissance, Ariosto's 'Orlando Furioso' (1515). In the neo-classical period, especially the 18th century, this loose and unauthenticated type of poetry was naturally regarded with little favor, and for equally obvious reasons it was enthusiastically revived by the representatives of the "romantic revival." In England the metrical romances of Scott, already referred to, were the most important results of the movement, especially 'Marmion' and 'The Lady of the Lake' (1808 and 1810). In the introduction to 'The Bridal of Triermain,' Scott distinguished the form from epic poetry as being free from all rules save "those which

good sense, good taste and good morals apply to every species of poetry." In the later 19th century it was again revived by William Morris in various imitations of the work of mediæval romancers; while in Germany a notably successful specimen was Scheffel's 'Trompeter von Sackingen' (1853).

The Tale, etc.—In all periods, and especially in modern times, narrative poetry tends to overrun the bounds of fixed types, and to appear in forms which may be vaguely called metrical tales or otherwise. In classical literature the most influential example of this form is the 'Metamorphoses' of Ovid, whose material sifted down into a great part of mediæval and Renaissance poetry. In the mediæval period the supreme example is the 'Canterbury Tales' of Chaucer, which drew upon every type of story material, combining sentiment and humor, realism and romance. In the Renaissance the Ovidian type of narrative poem is represented by Marlowe's 'Hero and Leander' and Shakespeare's 'Venus and Adonis' and 'Lucrece.' Dryden's 'Fables' (1700) are a landmark in another period, but are largely versions of tales by earlier poets. Like the metrical romance, the poetic tale was abundantly revived in the period of the romantic revival, sometimes with a view to the attainment of realistic simplicity, as in Wordsworth's 'Michael' or (in Germany) Goethe's 'Hermann and Dorothea,' sometimes with a preference for highly romantic elaboration, like 'The Eve of Saint Agnes' of Keats. Byron's "tales," nine in number, published between 1813 and 1823, went far to supplant the popularity of Scott's metrical romances, and in some cases might very well be called by that name themselves. Space does not permit the tracing of the varied development of the less defined types of narrative poetry through the 19th century. Perhaps the most remarkable experiment made in that period was Browning's 'The Ring and the Book' (1868), in which a single story is told 10 times over, in a series of monologues supposed to be uttered by various persons concerned. Tennyson, on the other hand, told the story of 'Maud' (1855) in a series of monologues and lyrics supposed to be uttered by a single person, forming a "monodrama." Both these works are characteristic of the trend of narrative poetry in modern times, toward subjective and spiritual qualities, as opposed to the objectivity of the increasingly rare epic method. On the other hand, the early 20th century has seen some return to the more objective tale in the Elizabethan narratives of Alfred Noyes's 'Tales of the Mermaid Tavern' and the realistic contemporary narratives of John Masefield, notably 'Dauber.'

Bibliography.—For the nature and development of the more primitive types of narrative poetry, consult Gummere's 'The Beginnings of Poetry' (New York 1901) and 'The Popular Ballad' (Boston 1907); Ker's 'Epic and Romance' (London 1897); Hart's 'Ballad and Epic' (Harvard Studies and Notes, Boston 1907); Saintsbury's 'The Flourishing of Romance and the Rise of Allegory' (London 1897); Billings's 'Guide to the Middle English Metrical Romances' (New York 1901); Schofield's 'English Literature from the Norman Conquest to Chaucer' (New York 1906); the introductions to the translations of 'Beowulf'

and the 'Song of Roland' in the 'Riverside Literature Series' (Boston); and the volume of 'Arthurian Chronicles' in 'Everyman's Library.' On the Greek epic, consult Lang's 'Homer and the Epic'; on epic poetry in general, Dryden's Preface to his translation of Virgil and Clark's 'History of Epic Poetry' (Edinburgh 1900); on English narrative poetry, Dixon's 'English Epic and Heroic Poetry' (1912); Murray, G., 'Classical Tradition in Poetry' (1927). Late Professor of English, Leland Stanford Junior University.

NARRENSCHIFF, nār'ēn-shīf, Das ('The Ship of Fools'), Sebastian Brant's celebrated work (1494). See BRANT, SEBASTIAN.

NARROWS. See TRELLISED DRAINAGE and STREAM PIRACY.

NARROWS, The. narrow part of New York Bay, a channel which connects Upper New York Bay with Lower New York Bay, and separates Long Island and Staten Island. At the south entrance of The Narrows are two forts, Fort Hamilton on Long Island and Fort Wadsworth on Staten Island. See map of Greater New York and vicinity under NEW YORK.

NARSES, nār'sēz, Byzantine general: b. Armenia, 472; d. Rome, 568. He was a eunuch when he entered the imperial household in Constantinople, of which he soon became chamberlain. His ability soon advanced him to the office of treasurer to Justinian, who sent him to Italy in 538 to keep an eye on Belisarius. Narses was recalled in 539 and in 551 succeeded Belisarius as commander-in-chief in Italy and speedily drove thence the Franks and Goths, and re-established Byzantine control. He took possession of Rome and was appointed prefect of Italy in 554. In spite of his able administration he was removed by Justinian's successor, Justin II, on the ground of his avarice which caused him to levy severe taxes on the people. Legend says that he was insulted by the Empress Sophia upon his dismissal, and that he thereupon went over to the Lombards. He was equally famous as general and statesman. Consult Hodgkin, 'Italy and Her Invaders' (1885-95, Vols. IV and V); Bury, 'Later Roman Empire' (Vol. I, 1889); Gibbon, E., 'Decline and Fall of the Roman Empire' (London 1898); 'Cambridge Mediæval History' (Vol. II, New York 1913).

NARTHEX (Greek, a reed, hence any oblong figure), the term used in ecclesiastical architecture to designate the westernmost division of an ancient Greek church, running like a cloister from the north to the south wall. It was a vestibule, separated from the nave proper by a screen or railing, beyond which catechumens and those under Church censure or penance were not permitted to advance. It had three door-ways, one on the west as well as one in the northern and southern walls. The western was the principal entrance and was known as "the beautiful" or "royal gate." The doors leading through the screen into the nave were named according to the classes who used them, "the priests' gate," "the men's gate," etc. The narthex was also used for funerals and public meetings; baptism was celebrated there and the font, which had formerly been

in a building adjoining the church, was also placed in the narthex. There was sometimes an inner and an outer narthex. Consult Binghams, 'Christian Antiquities'; Siegel, 'Christliche Alterthümer'; Walcott, 'Sacred Archaeology.'

NARUSZEWICZ, nā-roo-shā'vich, Adam Stanislaw, Polish historian and poet: b. Pinsk, Lithuania, 20 Oct. 1733; d. Janow, Galicia, 8 July 1796. He became a Jesuit in 1748; taught in the Jesuit schools in Vilna and Warsaw; and after the suppression of the Order became bishop of Smolensk, and later of Lutsk. His poetry, consisting of translations, odes, fables, epigrams, satires and idylls, was first published in 1778. In prose, he translated Tacitus, wrote a biography of Chodkiewicz (1781), composed a history of Crimea (1787), and on the suggestion of his patron, King Stanislaus Augustus Poniatowski, wrote his greatest work, a history of Poland down to 1386 (1780-86, new ed. 1859-60), which, because of its style and its protest against the abuses of a monarchy or an aristocracy, won him the name of the Polish Tacitus.

NARVA, nār'va, Esthonia, an important manufacturing town on the river Narōva, 100 miles southwest of Petrograd. It contains several Greek and Lutheran churches, has a fine town-hall, a castle, two gymnasia, a theatre and technical schools in connection with the cotton and woolen mills nearby. Cotton and lumber are the principal items of trade. The town was founded by the Danes in the 13th century, and after being held briefly by the Russians passed to the Swedes in 1581. Peter the Great took it in 1704. Here, on 30 Nov. 1700, was fought a battle between 8,000 Swedes under Charles XII and 80,000 Russians under General Dolgorouki. The Russians were besieging Narva, and after driving in 10 large bodies who occupied advanced positions, Charles boldly attacked their entrenched camp. After a brief cannonade the Swedes stormed the Russian trenches, and although the Russian artillery stood to their guns, the defenders were driven out in disorder after three hours of hard fighting. The Russians lost 18,000 men in the trenches and many more in the open fight; the Swedes only lost 600. Pop. 27,000, Germans, Esths and Russians.

NARVACAN, nār-vā-kān', a pueblo of the province of Ilocos Sur, Luzon, situated 13 miles southeast of Vigan, the provincial capital. It is on the main road and one of the most important towns of the province, being next the capital in population. Pop. about 22,000.

NARVAEZ, nār-vā-ēth', Pánfilo de, Spanish soldier in America: b. Valladolid, about 1470; d. near mouth of Mississippi River, November 1528. He came to America about 1498, settled first in Santo Domingo and then in Cuba, where from 1512 until his death he was under Velasquez in the command of an auxiliary force in the conquest of the island. The disobedience of Cortés in Mexico, whither he had been sent by Velasquez, led the latter to send Narvaez in 1520 to supersede and punish Cortés. This expedition was entirely unsuccessful. Narvaez landed at Vera Cruz in April; was defeated in May at Cempoala by the army of Cortés; lost one eye in the battle, and was deserted by the remnant of his army, which

joined Cortés. He was captured, but soon released; returned to Spain, where he was appointed governor of Florida in 1526, and sailing from Cuba in March of 1528, landed at Apalachee Bay, lost half his men on the march inland, retreated to the shore, where he found that his ships had been destroyed, and having built boats, sailed westward along the coast, only to be shipwrecked with all but four of his men. Consult Bourne, E. G., 'Spain in America' (New York 1907); Alvar Níñez Cabeza de Vaca, 'Relación' (in J. F. Jameson's, ed., 'Original Narratives of Early American History' (Vol. II, ib. 1907).

NARVAEZ, Ramón María, DUKE OF VALENCIA, Spanish general, and statesman: b. Loja, Andalusia, 4 Aug. 1800; d. Madrid, 23 April 1868. He entered the army in 1815; fought against the French and in 1822 assisted in putting down the uprising in the Royal Guards; lived in retirement at Loja from 1823 until the death of Ferdinand VII in 1833; in 1836 defeated the Carlist leader, Gomez; and in 1838, after clearing La Mancha of brigands, was made captain-general of Old Castile. He led an insurrection against Espartero, in 1840, his old chief, but was beaten and fled to France, where he joined the party of Maria Christina. He returned to Madrid in July 1843; Espartero left the country; and from May 1844 to February 1846, and from October 1847 to January 1851 Narvaez was Prime Minister, in recognition of his services to Maria Christina. In 1845 he was made grandee of Spain of the first class and Duke of Valencia. He began by changing his policies to the more conservative form, revising the Liberal constitution of 1837. He held the same post in 1856-57 and 1864-65, being Minister to Paris and Vienna in the intervals. During the military rising of 22 June 1866 Narvaez commanded the loyal soldiery, and in July succeeded the defeated O'Donnell as Ministry President and Minister of War. A Liberal in early life he became more and more conservative and spent his last years in attempting to keep Isabella on the throne. Consult Mazade, 'Les révolutions d'Espagne' (Paris 1869); Pirala, A., 'Historia contemporánea' (Madrid 1871-79).

NARVIK, nār'vīk, Norway, small town on the Ofoten Fjord, with beautiful mountainous surroundings. It is also known as Victoriahavn, and is the terminus of the Ofoten Railway which transports an enormous tonnage of Swedish iron ore. It is used by the tourists visiting the lovely Lofoten Islands. It is a station for coastwise trading steamers. Pop. about 7,000.

NARWHAL, a large porpoise which inhabits the Arctic Ocean. It belongs to the family *Delphinidae* and was named *Monodon monoceros* by Linnæus. Its most striking characteristic is the possession by the male of a very long, straight, spirally-grooved tusk, which projects forward from the left side of the upper jaw in line with the axis of the body. When full-grown the narwhal has a length of about 16 feet. The head is rounded, the back has a very low ridge instead of a fin and the pectoral fins are short and broad. The color of the body is gray above and white below, everywhere mottled and spotted with gray and black. The young are darker colored, while

old individuals are often nearly white throughout. The vertebral formula is as follows: Cervicals, 7; dorsals, 11; lumbers, 6; caudals, 26; total, 50. The cervical vertebrae, unlike those of other true porpoises, except the beluga or white whale, are all free. The skull is depressed, with a broad rostrum.

The massive tusk or maxillary tooth of the narwhal is developed only in the male, and with rare exceptions, only on the left side of the jaw. Normally the corresponding tusk or tooth of the right side remains concealed in the maxillary bone during life. In females neither tusk is visible. All other teeth are wanting in adults of both sexes. Occasionally, both tusks are developed in males and in females as well. About 16 such heads have been preserved, including one from Prince Regent Inlet, in the National Museum, Washington. The largest narwhal tusks are about eight feet long, with a girth of about nine inches at the base. They are hollow for a considerable proportion of their length.

The tusk is a secondary sexual character like the antlers of the stag, the spurs and comb of the cock, etc. It has been suggested that the narwhal makes use of the tusk to break the ice, to transfix its prey, or in combat, but these ideas lack confirmation.

When first introduced into Europe, the true origin of the tusks not being known, they were supposed to be the horns of the mythical unicorn. For a considerable time they were highly prized on account of their reputed medicinal properties, and are still made use of in China as a drug.

Narwhals occur in large herds or schools among the ice of the Arctic Ocean, northward of lat. 65° N. They migrate to higher latitudes as the ice recedes and return in the fall. Very rarely individuals stray southward along the coast of Europe as far as Scotland.

The narwhal resembles the beluga or white whale in many important characters, not shared by other porpoises, and forms with it a separate sub-family, the *Delphinapterinae*.

NASBY, nāz'bī, *Petroleum V.* See LOCKE, DAVID ROSS

NASCENT STATE, in chemistry, the state or the peculiar reactionary power possessed by an element at the instant of liberation from a compound or combination in which it has previously existed. At the moment an element is liberated from a compound of which it has been a constituent it acquires a higher power of chemical reaction than it displays some time after its liberation. One theory of the nascent state of an element is that the molecules at the instant of liberation are separate and independent; and that an appreciable length of time is required for their final arrangement; and that while they are in this free state they possess an extraordinary power of reaction, which power is otherwise exerted and expended in the act of molecular arrangement. For instance, it has been advanced by some chemists and physicists that hydrogen in a nascent state is made up of single atoms, while hydrogen in a gaseous state is composed of molecules, each molecule containing two atoms. Another theory is that nascent hydrogen is simply hydrogen under great pressure, for a mere increase in pressure will make ordinary hydrogen act

like nascent hydrogen. Thus many substances, such as aldehyde, will combine with nascent hydrogen which utterly refuses gaseous hydrogen.

NASCOPI, nās'ká-pē, or **NASCAPEE, INDIANS**, a Labrador tribe, the most northeasterly known branch of the Algonquian family. They formerly occupied the interior tableland extending from Lake Mistassini, in south central Quebec, Canada, to the Atlantic Ocean.

NASEBERRY, nāz'bēr-i, the fruit of *Sapota achras*, one of the finest West India fruits. The bark of the tree has astringent and febrifugal properties. See also SAPOTACEAE.

NASEBY, nāz'bī, parish, England, in Northamptonshire, 12 miles northwest of Northampton, on the north side of which, on June 14, 1645, Fairfax and Cromwell, commanding the Parliamentary troops, defeated Charles I and his army, taking 5,000 prisoners and capturing the royal cannon and baggage. An obelisk marks the site. Pop. (1939 est.) 399.

NASH, Abner, American politician: b. Amelia County, Va., Aug. 8, 1740?; d. Philadelphia, Pa., Dec. 2, 1786. He studied law and removed to New Bern, N. C., where he practiced successfully and in 1774 he was a member of the first provincial congress of North Carolina. He served as member of the council which framed the state constitution in 1776 and was speaker of the senate in 1779. He was governor of the state from 1779-1781 and in 1782-1786 sat in the Continental Congress.

NASH, Francis, American soldier: b. Amelia County, Va., May 10, 1720; d. Germantown, Pa., Oct. 7, 1777. He was a brother of Abner Nash (q.v.), and early removed to North Carolina, where he was clerk of the Superior Court of Orange County. He was a member of the assembly in 1771, 1773-1775. He served under the crown with a captain's commission, but resigned and was a member of the provincial congress which met in 1775 when he was appointed lieutenant colonel in the Continental Army. In 1777 he was commissioned brigadier general by the Continental Congress and at once joined Washington, under whom he commanded a brigade and was mortally wounded at the Battle of Germantown.

NASH, John, English architect: b. London, 1752; d. East Cowes Castle, Isle of Wight, May 13, 1835. He studied and practiced architecture under Sir Robert Taylor; then retired from business until 1793; and upon his re-entry into the profession gained much royal and noble patronage. He laid out Regent's Park and the street leading up to the park, now called Regent Street; remodeled Buckingham Palace and altered the Brighton Pavilion. He was particularly fond of single façades, of projecting colonnades and of a plentiful use of plaster and stucco. The use of cast iron girders was principally introduced by Nash, who patented several varieties. Personally he was an estimable man, but unpopular because of George IV's display of favoritism toward him.

NASH, Richard (called **BEAU NASH**), Eng-

lish leader of fashion: b. Swansea, Wales, Oct. 18, 1674; d. Feb. 3, 1762. He studied at Jesus College, Oxford, was for a time in the army, but finding military discipline not to his liking, entered at the Inner Temple. In 1705 his skill in gaming took him to Bath, which in 1703 had become a much frequented watering-place. He determined to improve the provincial character of the spa, and soon became a self-appointed but arbitrary master of ceremonies. He was known as the "King of Bath" and his rule was celebrated in prose and verse. His code included the prohibition of swords within his realm, a restriction which tended toward that consideration for the public peace which was then growing in England. His vanity grew with his power; he appeared in a monstrous cream-colored beaver and invariably journeyed by post-chariot with three span of grays, footmen and outriders. Gambling was prohibited by law in 1740, and Nash, by 1745, had lost his trade. The town granted him an annuity of £10 a month. Goldsmith wrote his life (1762).

NASH, or **NASHE, Thomas**, English satirist and dramatist: b. Lowestoft, Suffolk, 1567; d. 1601. He studied at Cambridge in 1586, spent some time on the Continent, and before 1588 came to London. In 1589 he published his *Anatomic of Absurdities*. In the literary warfare carried on between the Puritans and bishops Nash took an active part in behalf of the latter. Under the pseudonym **PASQUIL** he published the tracts *A Countercuffe Given to Martin Junior* (1589) and *Pasquil's Apologie* (1590). In 1592 he issued his powerful satire on contemporary society, *Pierce Penniless, His Supplication to the Diuell*. His *Christes Teares over Jerusalem* (1593) followed in repentant mood, and he affected to dismiss satire, in which, he said, he had "prodigally conspired against good houres." His notable work of picaresque fiction, *The Unfortunate Traveller, or the Life of Jack Wilton* (1594), to a certain extent anticipated Defoe. Involved in a paper war with Gabriel Harvey, who had boasted of having put him to silence, he thereupon published *Have with You to Saffron-Walden, or Gabriel Harveys Hunt Is Up* (1596), brimming with scorn. Nash also wrote plays, in whole or in part. He completed, unsatisfactorily (1594), Marlowe's *Dido*. His *Summers Last Will and Testament* (1593), comedy, was first published in 1600. A play, *The Isle of Dogs*, led to his imprisonment for attacks contained in it. He died having, as one epitaph put it, "never in his life paid shoemaker or tailor." Nash's personality was somewhat unique in Elizabethan literature. His prose was vigorous and his verses were at times those of a poet. His works were edited by Grosart (1883-1885).

NASHUA, nāsh'ū-ā, city, New Hampshire, one of Hillsborough County's seats; altitude 152 feet; on the Nashua and Merrimack rivers; 34 miles southeast of Concord; on the Boston and Maine Railroad; has a municipal airport. Nashua is the second largest city in the state, with well diversified industries. In 1823 the Nashua Manufacturing Company, the oldest industry in the city, was formed; it is known chiefly for its woolen blankets, although it manufactures other textile products. Machine tools and lathes were developed here in 1838-1852. Elias Howe (q.v.)

perfected the sewing machine in 1844-1846. The first watches were made by machinery about 1860. The first waxed wrappers for bread were made here in 1908. Major factory products now are: textiles including blankets, paper box machinery, shoes, gummed and coated paper, asbestos products, shears and refrigerators. A United States fish hatchery here has huge rearing ponds. Various other points of interest in the city include Greeley Park (125 acres), a gift to the city for recreation purposes; Holman Stadium, seating 5,300; Colonial House, built in 1803, an architectural gem; and Marsh Tavern, a well known stagecoach hostelry, dating from 1804. Originally a fur-trading post known as Watanic, the site was settled in 1656, became Dunstable town in 1673 and Nashua in 1803. It was incorporated as a city in 1853. Pop. (1940) 32,927; (1950) 34,666.

NASHVILLE, city, Tennessee, state capital, seat of Davidson County, and a port of entry, is situated on both banks of the Cumberland River (connected by bridges), and covers an area of more than 22 square miles. The city's average altitude is 500 feet. Nashville lies in the north central part of the state, 138 miles northwest of Chattanooga and 184 miles southwest of Louisville (highway mileage), in the Tennessee Basin, and is surrounded by a fertile agricultural area in which are raised cotton, tobacco, grains, livestock, fruits, and other products. The city is served by the Nashville, Chattanooga and St. Louis, the Louisville and Nashville, and the Tennessee Central railroads. On each side of the river is a municipal airport (the Berry and the Cumberland), which together provide Nashville with passenger transport, charter, and private airplane facilities. About 14 miles southeast of the city is the Sewart Air Force Base. A network of federal and state highways converges on Nashville for motorbus and truck transportation. There is river transport service also, the Cumberland at this point having a 9-foot channel. Although Nashville is a modern city, it has "a serene, Athenian quality," as Hodding Carter puts it.

Commerce and Industry.—Nashville is an important commercial center, with a thriving wholesale and retail trade; and six banking institutions, including a branch of the Atlanta Federal Reserve Bank. The city is also an important printing and publishing center, having two daily newspapers and more than 50 periodicals, most of them issued by religious or professional groups. It has railroad shops, limestone quarries, foundries, meat packing plants, and establishments which produce butter, spices, coffee, and other foods, rayon and cellophane, woven and knit clothing, shoes and boots, tobacco products, boats and barges, bridges, stoves, brick, and other products.

Educational and Cultural Institutions.—Nashville is one of the South's most important educational centers. Besides its public school system, it has private and parochial academic schools, business schools, a junior college for girls, and eight coeducational institutions of higher learning. Of these last there are, for white students, George Peabody College for Teachers—the largest teacher training center in the South—and Vanderbilt University (both institutions are private and nonsectarian); Trevecca Nazarene College (Nazarene); David Lipscomb

College (Church of Christ); and Scarritt College for Christian Workers (Methodist). For Negro students, there are Fisk University (which dates from 1865) and the Meharry Medical College (both of which are private and nonsectarian), and the Tennessee Agricultural and Industrial State College, one of the largest educational institutions for Negroes in the world. Each of Nashville's colleges and universities has its own library facilities, and the city's public library has a collection of about 436,000 volumes, in addition to files of Nashville's newspapers dating from 1818. In the War Memorial Building are housed the State Archives and two state historical museums containing relics of wars in which Tennesseans have fought. Vanderbilt University owns the Thurston Collection of Antiquities and Minerals which includes numerous artifacts of the Moundbuilders. In the Nashville Art Museum are rare collections of European ceramics and the works of American painters. Fisk University has an art gallery with unusually fine examples of modern art, including paintings by Paul Cezanne, Pablo Picasso, Diego Rivera, and Georgia O'Keeffe. Housed in the Parthenon in the city's Centennial Park is the Gowan Collection of paintings by American artists, dating from the colonial period. The Hermitage Hotel displays a score of Civil War scenes by the American artist William Gaul. Nashville has its own symphony orchestra and other musical organizations, among which are the world-renowned Jubilee Singers of Fisk University.

Notable Buildings and Other Points of Interest.—Near the heart of Nashville, on an eminence once known as Cedar Knob, is the State Capitol. Completed in 1855, it was patterned after an Ionic temple and built of fossilized Tennessee limestone blocks. Near its east portico is a bronze, equestrian statue of Andrew Jackson, 7th president of the United States, who as a young man, had his law office in Nashville; and whose beautiful old home, The Hermitage (1835), just a few miles northeast of the city, is maintained as a memorial to him. On the grounds of the capitol is the tomb of his friend, James K. Polk, one of Tennessee's governors and 11th United States president. Nearby is another building of classic design, the War Memorial, containing the historical museums already mentioned, and an auditorium with a seating capacity of 2,200. Perhaps Nashville's most beautiful public building is the replica of the Athenian Parthenon, with its 46 magnificent columns and its classical statuary. This modern structure of steel and concrete replaces an earlier replica in plaster, opened to the public in 1897.

Reminders of Nashville before the Civil War are the spacious private dwellings, built of bricks that were made by slaves, which can still be seen in the older parts of the city. A number of the city's churches also antedate the Civil War. Among these are First Lutheran Church (1838), St. Mary's Roman Catholic Church (1847), First Presbyterian Church (third on the site since 1816, and the cornerstone of which was laid in 1849), Holy Trinity Protestant Episcopal Church (built in the 1850's and given to its Negro parishioners in 1908), and First Christian Science Church (built 1856-1881 for an Episcopal congregation). Noted for the beauty of their architecture among the newer places of worship is the Roman Catholic Cathedral of the Incarnation, patterned after the church of San Martino ai

Monti in Rome; the Vine Street Temple (Jewish Reformed), designed in Byzantine style; and Christ Episcopal Church, in Victorian Gothic.

The city has a number of public parks containing playgrounds, swimming pools, lakes, tennis courts, municipal golf courses, driveways, bridle paths, and other recreational facilities. An unusually large variety of trees grows on its public and private grounds. Gardening is a popular hobby among Nashville denizens, and the city is famous for its iris which attracts visitors during the April Iris Festival when the flower blooms in parks and gardens.

Government.—The city's government is of the mayor-councilmanic type. Nashville's welfare program includes slum clearance and housing projects. As the capital of Tennessee, state government operations occupy a large place in the life of the city, and determine many aspects of its character. The federal government maintains in Nashville a customhouse and offices of several of its other agencies.

History.—Moundbuilders were the earliest human beings known to have inhabited the site of Nashville, but Shawnee Indians were the first ever seen by white explorers. In 1780 a white man's settlement was made at what was then called French Lick or Big Salt Lick, on the Cumberland River. As agent for the Transylvania Company, James Robertson had already explored the area and, late in 1779, led the first band of migrants overland from their homes in the Watauga Settlement. They arrived at their destination on New Year's Day of 1780. In the spring they were joined by a second group, led by Col. John Donelson who came by flatboat, arriving after a harrowing thousand-mile river journey during which 33 of the group perished. (Among the survivors was Colonel Donelson's daughter Rachael, who later married Andrew Jackson.) The same year (1780), the Cumberland Compact was drawn up under which the little community of about 300 made provisions for its government and security. Seven crude forts were erected along the river, the most important of which was named Fort Nashborough in honor of Gen. Francis Nash, Revolutionary hero who had died at the Battle of Germantown. In 1784 Nashville became the official name of the settlement and was incorporated as a town. It grew rapidly, particularly after the admission of Tennessee into the Union in 1796. In 1806 it was chartered as a city and had a mayor-aldermanic government. Nashville was already a trading center with flour and cotton mills, foundries and smithies. With the inauguration of steamboat service about 1819, and the completion of the first bridge over the Cumberland, Nashville became an important river port for the shipment of cotton down the Ohio and Mississippi. By this time, the city was also a fashionable center for the schooling of the daughters of wealthy Tennesseans. Except for 10 years, the state legislature met there during all the period between 1812 and 1843, when Nashville was officially designated the state's capital. Two years later, the Nashville and Chattanooga Railroad (now the Nashville, Chattanooga and St. Louis) was chartered, the first railroad in the state to be completed (1854). This not only contributed to the development of Nashville as a railroad center but also gave the city better commercial connections with the Middle West.

On the question of slavery the city was

divided, but after the state seceded from the Union in 1861, Nashville became one of the Confederacy's military headquarters, and home guards for the city were organized. In 1862, under threat of attack, the capital was temporarily moved to Memphis. A few days later Nashville surrendered to Union forces, and martial law was soon proclaimed. In 1864, in an attempt by a Confederate force to capture the city, a battle was fought in its environs. (See NASHVILLE, CAMPAIGN AND BATTLE OF.) The attempt proved disastrous, and Nashville remained in Union hands. Its suffering following the war was severe until, in 1868, a move for investigation instituted by its citizens released it from carpetbag rule. Recovery was slow until the middle of the 1870's, but the period 1870-1880 saw the population increase from 25,865 to 43,350, and reach 76,168 by 1890. The modern commercial, industrial, and educational center of today was beginning to emerge. When Tennessee celebrated its 100th year as a state, more than 6,000,000 visitors saw its Centennial Exposition at Nashville, opened officially by President McKinley. The growth of industries in the 1900's continued but at a slower pace until World War II, when extensive expansion took place.

Population.—Nashville is the second most populous city in the state, being exceeded only by Memphis. Its foreign-born population is small; its Negro population represents about 28 per cent of the total. The following figures indicate the population growth during the 20th century: (1900) 80,865; (1910) 110,364; (1920) 118,342; (1930) 153,866; (1940) 167,402; (1950) 174,307.

NASHVILLE, the name of a Confederate privateer that left Charleston in 1861 on a cruise to England and captured booty to the amount of \$3,000,000. In March 1863 she was sunk by a Federal ironclad in the Savannah River.

NASHVILLE, Campaign and Battle of. When General Sherman's picked army of 62,000 left Atlanta Nov. 15, 1864 for the March to the Sea, the Confederate Army under Gen. John Bell Hood, strengthened by Gen. Nathan B. Forrest's cavalry, was on the Tennessee River in the vicinity of Tusculum and Decatur, with Stephen Dile Lee's corps across the river and in advance of Florence. Active preparations were making for a move on Nashville with the Ohio as a possible objective. Gen. George Henry Thomas had been sent to Nashville six weeks before to organize a force to resist Hood. Toward the last of October the Twenty-third Corps (Gen. John McAllister Schofield's) and the Fourth Corps (D. S. Stanley's) were ordered to General Thomas, who sent them under General Schofield to Pulaski, with orders to delay Hood as long as possible to allow of the needed concentration and organization at Nashville.

General Thomas was working most energetically at Nashville to organize an army to meet Hood, while General Schofield, with his inferior force, was holding against him with the utmost stubbornness to gain time for Thomas.

Hood was baffled in his attempt to intercept General Schofield at Pulaski and Columbia, Schofield reaching the latter place, forming solidly before Hood, who arrived November 27, and holding him there to the limits of possibility. Again, by skillful work, Schofield reached

Franklin in advance of Hood, marching his troops at night within rifle-shot of the enemy's lines at Spring Hill. Here Hood threw his army *en masse* upon Schofield, who had taken position around the town. The attack was delivered at 4 P.M., and lasted into the night. It was one of the most desperate assaults of the Confederates on any field, and most depressing for them in its results, five general officers being killed, six wounded and one captured. (See FRANKLIN, BATTLE OF.) The night of the 30th Schofield withdrew to Nashville, and the morning of December 1 Thomas' army was united.

A part of Andrew Jackson Smith's veteran division arrived at Nashville during the battle of Franklin, but not in time to be sent to General Schofield. The rest of his division, and General James Blair Steedman's division from Chattanooga also arrived December 1.

Hood advanced the day after the battle of Franklin and established his lines in front of Nashville December 2. Not until Hood appeared before Columbia with the entire army that had confronted the three armies under Sherman, re-enforced with Forrest's 10,000 cavalry, and the fact appeared that Schofield was fighting a gallant, almost desperate game to hold him back while Thomas was working energetically to organize his forces, did the authorities at Washington and City Point realize that Thomas had been left with inadequate means.

This created a feeling at Washington and City Point approaching a panic. It was feared that Hood might avoid Thomas, cross the Cumberland and carry out President Davis' plan to have him push on to the Ohio. This fear was redoubled when the necessity appeared for Schofield to retire from Franklin. It was not so clearly seen that his stubborn holding against Hood had saved the situation which Sherman created. Instead of leaving Thomas, who up to that time had never lost a movement or a battle, to deal with Hood as his full knowledge of the situation might suggest, it was insisted that he should at once attack. The straits of the situation were recognized at City Point, and the day after Schofield's arrival Grant telegraphed: "Arm and put in your trenches your quartermaster's employees, citizens, etc." The fourth day Thomas was peremptorily ordered to attack. He calmly went on with his energetic preparations to deal a final blow to Hood. His despatches, clearly showing his situation and his active work, were ridiculed by Edwin M. Stanton and Henry W. Halleck, and Grant repeated his orders to attack, and next directed Halleck to relieve him, first with Schofield, and next with Logan, and Grant himself started to take general direction, although Thomas had explained that while he had the troops ready to attack, a sleet-storm had covered the country with a sheet of ice upon which neither men nor horses could move, but that the moment it melted he would attack. When John Alexander Logan reached Louisville he was met with the news of an overwhelming victory. The two-days' battle, December 15 and 16, was remarkable for its perfection of plan, and for the fact that in its progress to the end this plan was closely followed.

The Confederate main and advanced lines were intrenched on bold hills about two miles from the city. Their advanced salient was established within three eighths of a mile of the Union center. The Union lines extended from

the river above the city to the river below it. The Confederate lines were compact between the Murfreesboro Railroad at their right and the Hillsborough Turnpike, which ran south from the center of the city, across the Union center. Thus the Confederate lines covered less than half of the Union position. Benjamin Franklin Cheatham's corps was on the right, Lee's corps formed the center, and Alexander Peter Stewart's corps the left.

More than half the inner line was held by quartermasters' employees under Quartermaster-General Donaldson, and the rest of that line by new troops under Gen. J. F. Miller. Gen. A. J. Smith's corps held the right of the advanced Union line, Gen. T. J. Wood's line the center and General Schofield the left. General Steedman's division was in echelon to the front on the left. The night before the battle General Schofield's corps was moved to the left and front of Wood's line, and prepared to take prominent part in turning the Confederate left. The morning of the 15th fog veiled the rapid formation of Union forces in front of their works.

The battle began at 8 o'clock by a successful attack by General Steedman's division upon the earthworks commanding the extreme left. This attracted the enemy's attention to that quarter. About 10 o'clock Smith's corps moved against Hood's left, and James Harrison Wilson's cavalry corps of 9,000 horsemen and 3,500 dismounted men swung off in its wide circuit against the left and rear of the Confederate works, one division extending to the river below the city, and forcing back Hood's cavalry reserve under Gen. James Ronald Chalmers. Forrest's main body had been sent to attack Murfreesboro. Smith's corps moved obliquely against the Confederate left flank and took it in reverse. Schofield by a wide detour penetrated still further to the rear. At the same time Wood assaulted in front. Wilson's troopers carried earthworks, captured 27 guns and swept squarely into the rear of the Confederate left. These movements compelled its withdrawal for two miles. The next afternoon the same tactics were continued by Smith, Schofield and Wilson, while Wood on the Union center, and Steedman on the left, pushed forward to Hood's new line. This had been reformed with Benjamin Franklin Cheatham on the left, Stewart in the center and Lee on the right. The Union lines began the attack upon Hood's position at 3 o'clock with an unsuccessful assault by two brigades from Wood and one from Steedman upon the Confederate right. Soon after 4 o'clock Smith and Wood's corps on the front, with Schofield operating on their right and against the Confederate left flank, attacked in force, soon carrying the entire line. This attack and its results General Hood thus described in his official report: "The position gained by the enemy being such as to enfilade our line caused in a few moments our entire line to give way, and our troops to retreat down the pike in the direction of Franklin, most of them, I regret to say, in great confusion, all efforts to reform them being fruitless." Here 54 guns in position were captured. There was immediate and hot pursuit for nine days, led by Wilson's cavalry, when the remnant of Hood's forces crossed the Tennessee, having suffered a loss during his campaign of over 13,500 prisoners and 72 guns, and here the Union pursuit ended. Over 2,000 deserters came into the Union lines.

The result vindicated Thomas' insisting upon waiting for the remounting of his cavalry, since Wilson with his troopers formed an essential and controlling element in the battle and in a pursuit which were designed to disintegrate an army.

The records do not show the number of men with which Hood reached Tupelo. He claims that there were 18,500 left there after 3,000 were furloughed. He further says that of 14,000 that left Tupelo to join Gen. J. E. Johnston in North Carolina, 9,000 deserted. General Johnston's reports show that when Hood's forces reached him they numbered 3,953 officers and men. Thus, after Nashville, Hood's splendid force of Confederate fighters did not again appear as an army on the theater of war.

Even this complete victory, defeating the contemplated advance of the Confederate Army to the Ohio, did not fully allay the panic at Washington lest Sherman's movement to the sea should prove to have left the central West without sufficient protection, and while every possible effort in pursuit was being put forth in horrible weather, General Halleck thus telegraphed Thomas:

Permit me, General, to urge the vast importance of a hot pursuit of Hood's army. Every possible sacrifice should be made, and your men for a few days will submit to any hardships and privations to accomplish the great result. If you can capture or destroy Hood's army General Sherman can entirely crush out the rebel military force in all the Southern States. He begins a new campaign about the first of January, which will have the most important results if Hood's army can now be used up. A most vigorous pursuit on your part is, therefore, of vital importance to General Sherman's plans. No sacrifice must be spared to obtain so important a result.

General Thomas, nagged beyond endurance, put an end to this style of despatches by the following reply:

Your despatch of 12 m., this day, is received. General Hood's army is being pursued as rapidly and as vigorously as it is possible for one army to pursue another. We can not control the elements, and you must remember that, to resist Hood's advance into Tennessee, I had to reorganize and almost thoroughly equip the force now under my command. I fought the battle of the 15th and 16th instant with the troops but partially equipped; and, notwithstanding the inclemency of the weather and the partial equipment, have been enabled to drive the enemy beyond Duck River, crossing two streams with my troops, and driving the enemy from position to position without the aid of pontoons, and with but little transportation to bring up supplies of provisions and ammunition. I am doing all in my power to crush Hood's army, and, if it be possible, will destroy it. But pursuing an enemy through an exhausted country, over mud roads completely sogged with heavy rains, is no child's play, and can not be accomplished as quickly as thought of. I hope, in urging me to push the enemy, the department remembers that General Sherman took with him the complete organization of the Military Division of the Mississippi, well equipped in every respect, as regards ammunition, supplies, and transportation, leaving me only two corps, partially stripped of their transportation to accommodate the force taken with him, to oppose the advance into Tennessee of that army which had resisted the advance of the army of the Military Division of the Mississippi on Atlanta, from the commencement of the campaign till its close, and which is now, in addition, aided by Forrest's cavalry. Although my progress may appear slow, I feel assured that Hood's army can be driven from Tennessee, and eventually driven to the wall by the force under my command. But too much must not be expected of troops which have to be reorganized, especially when they have the task of destroying a force, in a winter's campaign, which was able to make an obstinate resistance to twice its numbers in spring and summer. In conclusion, I can safely state that this army is willing to submit to any sacrifice to crush Hood's army, or to strike any other blow which may contribute to the destruction of the rebellion.

This changed the tone of despatches from Washington and City Point. Grant and Stanton sent congratulations, and Grant, in his official report, after setting forth his impatience and

apprehensions that Hood would go north, said of Thomas: "But his final defeat of Hood was so complete, that it will be accepted as a vindication of that distinguished officer's judgment."

H. V. BOYNTON.

NASHVILLE, CHATTANOOGA AND SAINT LOUIS RAILWAY, The. The first railroad completed in the State of Tennessee. It was first advocated by Dr. James Overton who, in 1843, offered himself as a candidate for the legislature. He based his canvass on his railroad project which he believed would permit control of the large cotton trade of Georgia and Alabama. He was defeated, and his plan was deemed impracticable by the people who dubbed him "Old Chattanooga." Two years after his defeat, however, the necessity for other outlets from Nashville besides the Cumberland River brought the subject of railroads under agitation again. Through the pressure of many influential citizens the legislature passed an act on Dec. 11, 1845, incorporating a railroad from Nashville to Chattanooga. This act was amended in 1847 to permit the town of Nashville to subscribe \$500,000 for the benefit of the road, and "to raise money on loans by pledging the faith of the corporation; by pledging a portion of its taxes; by mortgage or otherwise to an amount not exceeding what might be demanded for the calls on the stock." Other major subscriptions were: from Murfreesboro, Tenn., \$30,000; Charleston, S. C., \$500,000; the Georgia Railroad and Banking Company of Augusta, Ga., \$250,000. The shares of stock then had a par value of \$25. In many instances the subscriber paid for his stock by actual work on the line, or in materials furnished. The state also gave material assistance by lending its endorsement to the bonds of the company issued from time to time on completed miles of railroad. The first train ran from Nashville to Antioch, 11 miles, on April 13, 1851, and when, on July 4, of the same year, a train arrived at Murfreesboro, the event was the occasion of a great celebration. People from all the surrounding country were on hand to celebrate this mark of progress. By May 1853, the road had reached Bridgeport, Ala., on the Tennessee River whence communication was established with Chattanooga by steamboat; but the entire line, 151 miles in length, was not completed until Feb. 1854. The iron track rail used was purchased in England, and delivered at Nashville for about \$45 per ton. In November 1871, the company purchased from the State of Tennessee the railroad properties of the Nashville and Northwestern Railroad Company, a line extending from Nashville, Tenn., to Hickman, Ky. In 1873 the name of the corporation was changed to its present name. The Western and Atlantic Railroad, extending from Chattanooga, Tenn., to Atlanta, Ga., was leased from Dec. 27, 1890, to Dec. 27, 1919, and later extended for an additional 50 years to Dec. 27, 1969. The Paducah and Memphis division is leased from the Louisville and Nashville Railroad Company for 99 years from Dec. 14, 1895. The several branches of the present system were built under separate charters, some of them by independent corporations. The parent company operates its present mileage under the charters granted originally to the various corporations which have been merged from time to time into its line. The main line extends from Memphis, Tenn., through Nashville and Chattanooga to

Atlanta, Ga. Its various branches extend to Union City, Tenn., and Paducah, Ky.; Sparta, Pikeville, Hohenwald and Lewisburg, Tenn.; and Gadsden, Ala. From most of these terminals the road has connections with other railroads to all parts of the country. During the Civil War the line was in charge of the Federal military authorities from March 1862 to Sept. 1865. The railway suffered many losses in equipment and through destruction during the Civil War and did not emerge from its difficulties until the early 1890's. But it has never passed through any form of reorganization, nor has it compromised or failed to pay any obligation.

NASHVILLE CONVENTION, in American history, a convention of delegates from the Southern states held at Nashville, Tenn., June 10, 1850, called to consider the slavery question and the encroachments of Northern abolitionists. The Wilmot Proviso and the Missouri Compromise were disapproved, but resolutions of open resistance advanced by Texas, South Carolina and Mississippi were voted down. The convention, which was never generally popular, met again in November and again moderate resolutions were adopted. For text of the resolutions adopted at both meetings consult Harper's *Encyclopedia of United States History*, vol. 8 (New York 1915).

NASIK, nā'sīk, or **NASSICK**, India, headquarters of a district of the same name in the State of Bombay; on the Godavari River, 30 miles from its source, and 107 miles northeast of Bombay. Nasik town is situated 5 miles northwest of Nasik Road, a station on the Great Indian Peninsula Railway. Due to the sanctity of the river Godavari, and to the belief that Rama, hero of the Ramayana, lived here for some time with his wife Sita, and his brother Lakshman, Hindus consider Nasik to be of special interest and holiness. On both sides of the river, but chiefly on its southeastern bank, lies the town of Nasik. Its buildings, covering an area of about 2 square miles, are divided into two parts—the new town to the north and the old town to the south. Though a place of great antiquity, the old town of Nasik has no ruins or buildings of any age, except the mosque on the site of the old fort. Nasik is the Nasica of Ptolemy, and was anciently a Mahratta capital. It is noted for its manufactures of brass and copper products, paper, and cotton. Interesting relics of the ancient religion were excavated in the 2d or 3d century A.D. Pop. (1941) 55,924.

NASMITH, nā'smīth, **SIR Martin Eric Dunbar**, English naval officer: b. 1883. As commander of submarine E 11, during World War I, he destroyed 96 Turkish vessels in the Sea of Marmora, an effort for which he was awarded the Victoria Cross. In 1928 he was promoted rear admiral; in 1932, vice admiral; and 1932–1934 he was commander in chief of the East Indies station. While serving as lord commissioner of the admiralty and chief of naval personnel (1935–1938) he was promoted admiral (1936). Vice admiral of the United Kingdom and lieutenant of the Admiralty in 1945, since 1948 he has been vice chairman of the Imperial War Graves Commission.

NASMYTH, nāz'mīth, **Alexander**, Scottish

painter: b. Edinburgh, Scotland, Sept. 9, 1758; d. there, April 10, 1840. Portrait painting was his specialty. He became pupil, and subsequently assistant, to Allan Ramsay, Jr., and accompanied that artist to London. He returned to Edinburgh (1779); and traveled in Italy (1782), where he devoted himself to landscape and historical painting. He was intimate with Robert Burns, and painted his portrait which is in the London National Gallery. Other of his notable works are: the large *River Scene* owned by the Society of Arts; *The Port of Leith* (1824); and *The Lawn Market* (1824). In 1822 he published 16 scenes described by Sir Walter Scott. Simple in style, his landscapes are finely composed and very impressive although as a painter he is considered inferior to his son Patrick (q.v.). Somewhat weak in coloring, his execution is neat and detailed rather than vigorous in character. The Nasmyths were an artistic family of whom, between 1829 and 1866, no less than six women painters exhibited in London.

NASMYTH, James, Scottish engineer: b. Edinburgh, Scotland, Aug. 19, 1808; d. South Kensington, England, May 7, 1890. He was the son of Alexander Nasmyth (q.v.). After study at Edinburgh University, he went to London in 1829, offered his services to Henry Maudslay, founder of a well-known engineering firm, and was appointed assistant in his private workshop. There he remained until 1831, when he returned to Edinburgh and constructed a set of machine tools with which he began business in 1834 at Manchester. Here he was so successful that he had soon to erect a large new workshop at Patricroft near Manchester, where he became famous as a machine constructor and inventor. Chief among his inventions was the steam hammer, designed in 1839, and in 1842 patented in an improved form. The first hammer was constructed from a view of Nasmyth's sketches by Joseph Schneider at Creusot, in France, about 1841; but the first British one was erected by Nasmyth at Patricroft in 1843. Among Nasmyth's further inventions are a nut-shaping machine, a hydraulic punching-machine and a flexible shaft for driving small drills. In 1856 he retired from the firm of Nasmyth, Gaskell and Company, which he had founded, and devoted himself to the study of astronomy. He was the first to observe the mottled appearance of the sun's surface known as "willow-leaves" or "rice grains" (1860). He is author of *Remarks on Tools and Machinery* in Sir Benjamin Baker's *Elements of Mechanism* (1858); *The Moon Considered as a Planet, a World and Satellite* (1874), with James Carpenter, and an autobiography edited by Dr. S. Smiles (1883, new ed. 1895).

NASMYTH, Patrick Milner, Scottish painter: b. Edinburgh, Scotland, Jan. 7, 1787; d. Lambeth, London, England, Aug. 17, 1831. He studied under his father, Alexander, and developed great talent for landscape in spite of ill health and a crippled right hand which necessitated the use of the left in painting. He went to London in his 20th year and established his reputation in 1809 by his first picture *A View of Loch Katrine* which was exhibited at the Royal Academy. He invariably painted *en plein air*; in his last sickness he was raised on his bed to watch through the window a violent thunder-storm that was raging, during which he expired. His pictures

are highly valued; his *View in Surrey* sold in 1892 for \$13,125.

NASO, nā'sō. See OVID.

NASR-ED-DIN, nā'sēr-ēd-dēn, shah of Persia (1848-1896): b. April 24, 1831; d. May 1, 1896. Although not the heir apparent, the ability and influence of his mother induced his father, Mohammed Mirza, to proclaim him his heir. His accession to the throne was disputed by the reformer El Bab, proponent of a pantheistical sect whose doctrine forbade concubinage and polygamy (q.v.). He crushed the opposition mercilessly and became the ablest ruler that Persia had had in many years. Assisted by his vizier, Mirza Taki Khan, he began his reign with reform measures. He also studied European methods of warfare, and proved himself to be a master of finance. He effectively crushed various insurrections, and by his occupation of Herat in 1856 provoked a war with Great Britain which was concluded in 1857. In 1873-1878, and in 1889, he visited western Europe and endeavored to establish more friendly relations with England, soon, however, to return to his friendship with Russia. He favored progress and Western civilization in so far as it did not conflict with his despotism. Under his reign the telegraph through Persia connecting Europe and India was established. He was assassinated in 1896, and succeeded by his son, Muzaffar-ed-Din.

NASSAU, Robert Hamill, American missionary in West Africa; b. near Norristown, Pa., Oct. 11, 1835; d. May 6, 1921. After teaching in Lawrenceville, N. J., he studied three years in the Princeton Theological Seminary (1856-1859). Later, he studied medicine at the University of Pennsylvania. His linguistic ability, intimate knowledge of African native thought, customs and languages, and his skill in managing African tribesmen, made him an effective missionary. In the last eleven years of his life in Ambler, Pa., he wrote several books, the most notable of which was *Fetichism in West Africa*.

NASSAU, nās'ō, city and capital of New Providence, chief of the Bahama Islands, a British Colony, in the North Atlantic Ocean off the coast of Florida. The town is built on rising coral ground at the northeast end of the island. Its excellent harbor permits large steamships to enter and turn. Nassau has fine government and other buildings, including a public library with a museum. The western entrance to the harbor is dominated by the historic Fort Charlotte, named after Queen Charlotte, consort of King George III. The fort has many dungeons, corridors, and underground stairways. The Sea Gardens, at the eastern end of the harbor, attract many visitors who, through a glass-bottomed boat, may view a submarine coral garden with fish of many colors, sizes and shapes. Nassau has a mild and healthful climate, and is a popular winter resort for Americans and West Indians. The United States has here a consular agent. Nassau was founded by the English in the 17th century, destroyed by the French and Spanish in 1703, and rebuilt in 1718. It was fortified 20 years later, and opened to free trade. Pop. (1943) 29,391.

NASSAU, nās'ō, Prussia, formerly an inde-

pendent duchy, later the Wiesbaden government district of Hesse-Nassau province. Its chief city is Wiesbaden. Situated north and east of the Rhine it is a hilly and thickly forested area intersected by the Taunus Mountains and the Lahn River. The low-lying areas produce wine in abundance, also grain, flax, hemp and fruit. The territory abounds with mineral springs, the most popular being Wiesbaden and Ems. Nassau has considerable mineral wealth but is not an important industrial center.

NASSAU, nās'ō, **House of**, a princely family whose duchy was located on the east bank of the Rhine. The title was taken by Walram I, count of Nassau (d. 1198), a descendant of one Drutwin (d. 1076), generally regarded as the founder of the house of Nassau. Walram placed his lands under the suzerainty of the king of Germany. The duchy increased considerably in size. About the year 1255 their patrimony was divided into two branches of the house of Nassau by Walram's grandsons, Walram II and Otto I. The estates of the elder German line, founded by Walram II, were in the southern part on the left bank of the Lahn River where Wiesbaden became the ducal residence. Adolf of Nassau, son of Walram II, became king of Germany (1292-1298). The German line was later partitioned into several branches most of which failed to perpetuate themselves; but Walram's share of Nassau was united with NASSAU-WEILBURG (1816). When Duke Adolf (1817-1905) took sides with Austria (1866), Nassau was absorbed into the kingdom of Prussia.

The younger Dutch line, founded by Otto I (d. about 1292), occupied the northern part of the region on the right bank of the river, and was closely identified with the history of the Netherlands. Its capital was Siegen. It was later divided among Otto's three sons. From this division arose: (1) The Engelbert I, of NASSAU-DILLENBURG branch, which acquired lands in the Low Countries (1404). A descendant, Henry III, later inherited both German and Dutch possessions. His son, René, inherited from his father the principality of Orange. At his death in the trenches of St. Dizier (1544), his titles and estates passed to his cousin, William I, count of Nassau, later surnamed William the Silent (d. 1584), the famous stadholder of the Netherlands, whose descendants were known as princes of ORANGE-NASSAU. One of them was William III who became William III of England, that line becoming extinct in 1702.

(2) John VI, count of Nassau, a younger brother of Henry III, ruled Nassau-Dillenburg until 1606, when his four sons founded new branches, two of which were extinct by 1739. The NASSAU-SIEGEN branch, founded by the eldest son, Count Joan Mauritz (1604-1679) became extinct in 1743; but the NASSAU-DIETZ line, founded by the third son, Ernest Casimir, has survived to the present. One of Ernest Casimir's descendants, John William Friso, inherited the Orange possessions in the Netherlands, and the latter's son, William IV, after reuniting all the Orange estates (1743), became hereditary stadholder of the Netherlands in 1747. The title was lost by his son William V in 1795 when he was expelled by the French republicans. Upon his death in 1806, the latter's son William VI succeeded to the duchy of Nassau. The new duke, refusing to adhere to the Confederation of

the Rhine (q.v., the league of German states formed by Napoleon), joined the Prussian Army, was captured at Jena (Oct. 14, 1806), and all his possessions confiscated. However, when the Congress of Vienna constituted the kingdom of the Netherlands, to include Belgium and Holland, he was chosen the first sovereign and was proclaimed King William I on Mar. 16, 1815. In recompense for his hereditary estates, given to Prussia and Nassau, he received the grand duchy of Luxembourg. The now royal house of ORANGE (sometimes still called Orange-Nassau) continues to rule over the Netherlands.

NASSER, nā'sēr, Gamal Abd el-, Egyptian soldier and public official: b. Beni Mor, Asyut Province, Egypt, Jan. 15, 1918. Founder of Egypt's "Revolutionary Movement," Lieutenant Colonel Nasser directed an army revolt against the government (July 1952), forced King Farouk's abdication, organized a republic, and placed in the premiership and presidency the popular Gen. Mohammed Naguib (q.v.). Intense rivalry developed between them and early in 1954 Colonel Nasser, who had contented himself with the office of deputy premier, twice assumed the premiership. In November 1954 he caused Naguib's removal from both offices. Thereafter Premier Nasser dominated the government.

NAST, Condé. American publisher: b. March 26, 1874; d. Sept. 19, 1942. Born in New York of a French mother and German father, he grew up in St. Louis. At Georgetown University he became manager of the baseball team. Engaged first to write advertising for *Collier's* magazine, he later rose to business manager having greatly increased the circulation of the magazine. Later, for a nominal sum, he acquired *L'Espresso*, then a 24-page fashion magazine which, under his direction, became an outstanding success. To this he added *Vanity Fair* and *House and Garden*, also recognized as leaders in their field. After financial reverses around 1929, he applied himself with characteristic energy and integrity to the rehabilitation of his fortune. In this endeavor he succeeded largely because of his perspicacity in the selection of executives. His printing plant at Greenwich, Conn., became one of the largest in that state.

NAST, Thomas, American cartoonist: b. Landau, Bavaria, Sept. 27, 1840; d. Guayaquil, Ecuador, Dec. 7, 1902. His mother brought him to the United States in 1846 where he attended the public schools. He was employed as door-keeper in Bryant's Art Gallery in New York, where his spare time was spent copying the paintings. He studied at the National Academy of Design, New York. At the age of fifteen he showed some of his sketches to Frank Leslie, and was engaged by *Frank Leslie's Illustrated Newspaper* at four dollars a week. In 1860 he was sent to England to draw the Heenan-Sayers prize fight. Later, he extended his tour to Italy and sent to New York periodicals pictures of the fighting in Garibaldi's revolt. He returned penniless to America (1861) and in that year married Sarah Edwards. In 1862 he joined the staff of *Harper's Weekly*. His clever cartoons soon became famous. His political and personal caricatures (1871-1873) directed at the Tweed Ring in New York City brought him further fame and power. He bitterly opposed Greeley in

1872, Tilden in 1876, and Hancock in 1880, urging against each of these nominees his inevitable connection with Tammany Hall. He left *Harper's Weekly* in 1887 and in 1894 joined the staff of the *Pall Mall Gazette*. For several years he published *Nast's Almanac* which he illustrated. He also illustrated *Pickwick Papers* and *Pictures from Italy*. His cartoon *Peace* in 1862 attacking opponents of the continuance of the Civil War and the reconstruction period attracted great attention. It is said that President Lincoln designated him "our best recruiting sergeant." To Nast belongs the fame of being the first to typify the Republican Party by the elephant; the Democratic Party by the donkey; and Tammany Hall by the Tiger. Nast also painted in oils, particularly scenes in the Civil War. His work was both realistic and dignified. In May 1903 he was appointed United States consul at Guayaquil, where he died of yellow fever.

Consult Paine, A. B., *Thomas Nast; his Period and His Pictures* (New York 1904), and *Life and Letters of Thomas Nast* (New York 1910).

NAST, William, Methodist Episcopal clergyman and editor; founder of the first German Methodist church in the United States: b. Stuttgart, Germany, June 15, 1807; d. Cincinnati, Ohio, May 16, 1899. After his confirmation (1821) he attended the theological seminary at Blaubeuren. At the age of 18 he entered the University of Tübingen, but became a rationalist and took up literary work till 1828 when he emigrated to the United States. He became tutor at Duncan's Island, Pa., and in 1830 was librarian and instructor of German at West Point Military Academy. Resigning (1832), he became instructor in German, Greek, and Hebrew at Kenyon College, Gambier, Ohio. He joined the Methodist Episcopal Church (1836) and was appointed missionary evangelist for Cincinnati. One of his converts, John Swahlen, became co-founder with Nast of German Methodism. In 1838 he organized the first German Methodist Church in Cincinnati, and became editor of a German church-paper, *Der Christliche Apologete*, which position he held for 53 years. Many German publications of the church were edited by him. Among the most important were *Das Leben und Wirken des Johannes Wesley und seiner Haupt-mitarbeiter* (1852); *Die Aufgabe der Christlichen Kirche im neunzehnten Jahrhundert* (1857); a commentary in German on the New Testament (1864); *Das Christentum und seine Gegensätze* (1883). He visited Europe several times in connection with his calling, and was one of the founders of German Wallace College at Berea, Ohio, later merged with Baldwin as Baldwin-Wallace College.

NASTURTIVM, the Indian cress (*Tropaeolum majus*) a perennial climbing plant, native of Peru, with pungent fruits and showy spurred flowers in varying shades of red and yellow. There is a smaller species (*T. minus*). See also TROPÆOLUM.

NASUA. See COATI.

NAT TURNER'S REBELLION, in American history, a term applied to a Negro insurrection at Southampton, Va., in 1831. The rebellion was led by Nat Turner, a Negro slave, who believed himself chosen by God to free the

colored race. In August 1831, Turner and a band of followers went from house to house with the intention of killing all white people, and before they were dispersed 55 persons had been murdered. The lives of many whites were saved by the faithfulness of their slaves. As outcome of the rebellion, more stringent laws governing slaves were enacted, free Negroes lost their privileges, and the manumission movement received a great setback. See TURNER, NAT.

NATA, nă'tă, in Mexican mythology, the name of a former legendary prophet, who in the "Age of Water" (Atonatiuh) escaped with his wife, Nena or Xochiquetzal, from the general destruction of mankind by the deluge, in a boat made from the trunk of an ahuchueté, or Mexican cypress tree, or according to another version, either in the hollow of the tree or on the trunk of the tree itself. The proper name of this legendary Nahuatl Noah is Coxcox, the term Nata being apparently correlative with Tata, the "old father," or uncle or simply the "old one." The legend of Coxcox was common not only to all the Nahuatl tribes, but it was recounted by the Zapotecas, the Mixtecas and other cultured races of Mexico. According to this flood legend, Coxcox and his wife landed at Mount Colhuacan (Place of the Colhuas); and their children increased very rapidly; but they were all born dumb. Finally a dove took pity on them and gave them the power of speech. But they all spoke different languages. Of the descendants of Coxcox or Nata, 15 chiefs spoke the same tongue or nearly so; and from these were descended the different tribes of the Nahua race. According to a Michoacán version of the same myth, their deluge hero who was called Tezpi escaped in a large boat with his wife, his children and numerous animals and various kinds of grain for seed. According to still another version of this story, the people drowned in the deluge did not die but were turned into fishes; for the earth-ocean and the sky-ocean drew near to one another and they were overwhelmed in the down-pour of the sky-waters into the earth-waters, which swallowed up even the highest mountains for an Aztec century (52 years).

NATAL, nă-tăl', Union of South Africa, one of the four original provinces. Bordering on the Indian Ocean, it is bounded on the north, west, and south by Mozambique, Swaziland, Transvaal and Orange Free State provinces, Basutoland, and Cape of Good Hope Province. The area is 35,284 square miles, and the population numbered 1,946,468 at the census of 1936; the whites numbered 218,139 in 1941. Pietermaritzburg (pop. 1936, 49,539) is the provincial capital; and Durban (pop. 1944, 285,800) is the largest city of Natal and the Union's second seaport in size.

Topography.—The chief natural boundary on the land side of the province is formed by the Drakensberg Mountains, separating it from the Orange Free State and Basutoland. Natal proper is separated from Zululand (q.v.), administratively part of the province, by the Tugela River; and on the southwest, the rivers Umtamvuna and Umtamvuna form much of the boundary between Natal and Cape Province. The 400 miles of coast line contains the mouths of numerous other streams but, with the exception of the landlocked circular bay on which Durban stands, is

destitute of creeks and bays. The surface of the province is finely diversified, rising rapidly from the seaboard in a confused succession of hills and ridges toward the lofty mountains on the western frontiers; much tropical cultivation is carried on in the numerous beautiful valleys. From the main mountain chain numerous transverse branches proceed nearly at right angles and form a series of minor watersheds, separating the various streams. Most of the latter, flowing through precipitous ravines and rocky gorges, are too shallow to be navigable.

Climate.—The coast lands of Natal are decidedly warmer than the eastern seaboard of Cape Province, but in the north, as the height above sea level increases, the climate approximates to that of the Transvaal. On the coast the range of temperature is from 47° to 88°, giving an average in summer of 76° and in winter of about 55°. Inland, in the region of Pietermaritzburg, the mean temperature of July, the coldest month, is 55°; of February, the hottest, 80.5°; and of the whole year, 67°. During the rainy season (October–March) thunder showers are of almost daily occurrence. Long droughts are almost unknown.

Flora and Fauna.—Under such climatic conditions, and with a soil of considerable fertility, vegetation is obviously vigorous. Despite heavy cutting in the past, the forest lands of Natal, particularly in the west, still have much virgin timber; most common species is *Podocarpus thunbergii* (yellow wood), much used for building purposes. Most of the fauna common to other parts of the Union of South Africa (q.v.) are to be found in Natal. Lion and leopard are scarce, but antelopes and gazelles are plentiful, as are, too, the hyena, tiger cat, jackal, ant bear, and porcupine. The hippopotamus has still his haunts, particularly in Zululand in streams near the sea, where also are numerous small crocodiles. Snakes, some of them venomous, are plentiful. Birds found in Natal include cranes, vultures, several varieties of eagle, and the secretary bird.

Population.—Three quarters of the inhabitants of Natal are native Africans (1,553,629 at the 1936 census), predominantly of Zulu and other Bantu stock. The Indian population (183,661 in 1936) is larger than that found in the other three provinces combined. First brought into the country in 1860 to work on the sugar plantations, the Indian community has grown steadily until its numbers almost equal those of the white population. While the bulk of the latter are of British extraction, Dutch predominate in some of the northern districts; other racial groups, though in small numbers, include Germans and Scandinavians. Compared with the other provinces, Natal has a limited number of colored people (of mixed blood).

Education.—With the exception of higher education, which is under the control of the Union government, the educational system is supervised by the provincial administration. There are separate schools for white, native, Asiatic, and colored children, some supported entirely by public funds and others in receipt of state grants. Out of 385 schools for white children in 1943, 44 of them provided an education beyond the primary standard; there were also 881 schools for natives, 130 for Indians, and 35 for colored children. A total of 179,718 children were attending school in 1943, of these 34,973 being white pupils; the government spent £1,528,230 on educa-

tion in 1943-1944, of this sum £936,814 being allotted for the schooling of white children. Natal University College, which was founded in 1909 at Pietermaritzburg and has a branch at Durban, is an affiliate of the University of South Africa. Besides its responsibility for higher education, the Union government also provides vocational and agricultural instruction in Natal and the other provinces.

Government.—The powers of the unicameral legislature of the province are quite limited, being restricted to enactments (ordinances) pertaining to such subjects as elementary and secondary education, and the maintenance of hospitals and roads (other than "national" roads and those within municipalities). In addition to this legislature (Provincial Council) of 25 members, the voters of Natal also elect 16 members to the Union House of Assembly and 8 to the Union Senate. Executive power in the province is exercised by an administrator nominated by, and responsible to, the Union government; the administrator is assisted by an executive committee of four members elected by the Provincial Council. Since the provincial legislature has only limited powers of taxation, the Union government provides annual subsidies and grants in order to balance the local budget. In 1941-1942, out of total revenue of £2,567,703, provincial taxation in Natal yielded only £1,585,600.

Agriculture.—Much the most important of agricultural crops is sugarcane. The first sugar mill was erected in 1849, at Compensation, and cane was first cut on a commercial scale in Zululand in 1908. By the year 1940 a total of 340,396 acres of the province were under cane on plantations under white management, 85,672 acres being planted with Uba cane and 254,724 acres under other varieties. While the bulk of the labor force on the sugar plantations was originally Indian, native Africans subsequently were employed in large numbers. Despite the damage wrought by bollworm, cotton is grown on a moderate scale in Zululand and in northern and eastern Natal proper. The province produces only about 15 per cent of the Union's total corn (maize) crop (the country's largest), and other grains also grown on a limited scale include barley and oats. Among other crops are peanuts, potatoes, sorghums, and tobacco. Teff, a staple cereal food crop of Ethiopia, is grown in the uplands of Natal as feed for cattle. Over half a million acres in Natal are devoted to plantations of wattle, *Acacia molissima*, the bark and extract of which (used for tanning) constitute one of the province's most important exports; production from 1940 to 1944 had a value of approximately £6,000,000. Tropical and semi-tropical fruit trees in wide variety do well, both fresh and canned fruits being exported in increasing quantities.

Mineral Resources.—Coal is the principal mineral mined in Natal. Discovered in 1840 and first produced some 40 years later, coalfields have been developed on the Klip River and in the Vryheid and Utrecht districts; reserves of coal have been estimated at 8,400,000,000 tons. Underlying many of the coal measures are seams of iron ore from one to six feet thick; the main deposit is at Prestwick, where the ore is of excellent quality. The province lacks the great deposits of diamonds and gold found in other parts of the Union; a few occurrences of gold have been located in Zululand and in the neigh-

borhood of Vryheid, but little development has been effected. Asbestos and nickel have been located in Zululand, and natural gas occurs in several places in Alfred County, Natal; the province also possesses small deposits of manganese, titanium, wolframite, tin, corundum, vanadium, fluor-spar, gypsum, and molybdenum. Considerable quantities of zircons were found in Zululand in 1926, the Umhlatuzi River and its tributaries, 15 miles north of Eshowe, yielding crystals of high quality. The only city of Natal with manufacturing industries of importance is Durban, where matches, paints and varnishes, soaps, and surgical instruments are made.

History.—Natal owes its name to having been discovered on Christmas Day, 1497, by Vasco da Gama (q.v.). The Dutch government at Cape town acquired, in 1689, the bay in which subsequently the seaport of Durban was founded, but it was not until 1824 that a settlement was established there (at what was then called Port Natal) by Francis George Farewell, a former British naval officer. Dutchmen who later reached Natal overland during the Great Trek became involved in fighting with the Zulus, and in 1838 scored a notable victory over the great chief Dingaan. A Dutch republic named "Natalia" was proclaimed in 1840, but the British annexed the country in 1843. Natal was administered as part of Cape Colony until 1856, when it was constituted a separate colony and given its own elective assembly. The colonists of Natal served as volunteers in considerable numbers through the war with the Zulus in 1878-1879, but the conflict seriously checked the country's progress. In return for services rendered to a Zulu chieftain in 1883, a party of Transvaal Dutchmen obtained cession of a large section of Zululand and there constituted the "New Republic." Reduced in area to comprise the Vryheid and neighboring districts, the nascent state was annexed to the South African (Transvaal) Republic in 1888; and meanwhile, in 1887, all the remainder of Zululand was annexed by Great Britain. In 1897, Zululand was incorporated into the colony of Natal; and, in 1903, following the South African War (q.v.), the Vryheid area was detached from the Transvaal (by this time a British colony) and joined to Natal proper. From the commencement of its history as a colony Natal had had a white population of predominantly British origin, and in the recurring disputes with the South African Dutch the colonists consistently supported the British government. Nevertheless, by a referendum taken in 1909 the electors of Natal expressed a desire to link their fortunes with the Dutch in the proposed new dominion; and accordingly, the next year, Natal relinquished the status of colony to become a province of the Union of South Africa (q.v.). Consult Hattersley, Alan Frederick, *Portrait of a Colony* (London 1940).

NATAL, Brazil, the principal seaport and capital of the state of Rio Grande do Norte. on the right shore of the Potengi River near the Atlantic, 150 miles north of Pernambuco. Notwithstanding the sand bars at the entrance to the harbor, considerable export trade is carried on chiefly of cotton, sugar, rubber, hides, and lumber, about \$1,000,000 annually. The United States is represented by a consular agent. Natal was originally called *DINADE dos Reis*. Pop. (1940) 55,242.

NATALIE, năt'a-lê, a queen of Serbia: b. May 14, 1859. She is a daughter of Pierre Ivanovitch Keschko, a Russian officer, and married Prince Milan, afterward king of Serbia, in 1875. The marriage turned out unhappily and the union was broken in 1888, when Milan obtained a divorce. The king abdicated in the following year, and Natalie, returning to Belgrade, the Serbian capital, resided there for a time with her son, King Alexander, enjoying the favor of the people; but in 1891, at the request of the National Assembly, left the country on account of political interests. Becoming reconciled to Milan in 1893, she resumed her former relations with the royal family; and returning to Belgrade in 1895 she was greeted by the people with every token of popularity. Her residence has since been chiefly in Biarritz, France; and after the assassination of King Alexander (1903) the political authorities at Belgrade decreed that she should not again enter the Serbian kingdom. She became a Roman Catholic in 1902.

NATATORES, an obsolete group of birds, the swimmers, artificially allied by Illiger on their likeness in pursuing an aquatic life, but structurally having relationships with several natural orders. Similar illogical groupings in the same by-gone but once popular classification were *Clamatores*, the screamers; *Scansores*, the climbers; *Cursores*, the runners, etc.

NATCHEZ, năch'êz, Miss., city, county seat of Adams County, on the Mississippi River; also on the Yazoo and Mississippi Valley; the Mississippi Central; and the Missouri Pacific railroads, 90 miles southwest of Jackson. A new Mississippi River bridge, costing \$4,000,000 was opened in 1940. Natchez has a ferry to Vidalia, La., and steamer connection with Mississippi River ports. The main part of the city is on high bluffs; along the river front is Natchez-under-the-Hill. The country surrounding Natchez is chiefly devoted to livestock and cotton growing. There was a cottonseed oil mill here in 1834. The principal factory products now are lumber, veneer, boxes, hardwood products, automobile tires and tubes, shirts, candy, and fruit cake. Since 1932 the Pilgrimage Garden Club for two weeks in March each year displays the city's wonderful gardens with azaleas and camellia japonica, and the many fine mansions dating back before the Civil War. Two taverns are famous—King's, the oldest house in the state, and Connelly's (1795; restored by the Garden Club). The ante-bellum mansions include: The Elms, Hope Farm, Linden, and Airlie (all built before 1790); Auburn (1816), in a city park of 210 acres; The Briers (1812), where Varina Howell married Jefferson Davis; Gloucester (about 1800), home of the first governor of Mississippi Territory; Rosalie (1820); D'Evereux (1840); Stanton Hall (1851); Lansdowne (1853); Montaigne (1855). In the center of the city is a Confederate Memorial Park, and other parks overlook the river. On a bluff just outside the city limits is a national cemetery. Six miles out of the city is a famous preparatory school, Jefferson Military College (1802). In the city are Natchez College (colored), the Fisk Library and the Agnes Z. Carpenter Public Library. The government (charter of 1877) is by a mayor, who holds office two years, and a council of eight.

La Salle and Tonti were here in 1662, and in 1716 Bienville built on the bluffs Fort Rosalie named for the Duchess of Pontchartrain. The place was destroyed in 1729, by the Natchez Indians. The fort came into possession of the English in 1763, when the name was changed to Fort Panmure. In 1779 the Spaniards took possession, and in 1798 the United States took possession of Natchez and much of the adjacent territory. From 1798 to 1802, and from 1817 to 1821 Natchez was the capital of Mississippi; in 1803 it was incorporated as a city. A tornado destroyed much of the city in 1840. In 1860 Commodore Porter shelled the city, and in 1861 Federal troops took possession. Pop. (1930) 13,422; (1940) 15,296; (1950) 22,740.

NATCHEZ, na-châz, **Les**, a romance by Chateaubriand, published in 1825–26, many years after the author first planned it. The work was written during his exile in England, long after his journeyings in America, of which country it contains his views as well as setting forth his psychological speculations and philosophy of life.

NATCHEZ INDIANS. See CREEKS.

NATCHITOCHE, năch-i-tôch'êz, an American Indian tribe formerly living along the banks of the Red River, in Louisiana. They were driven from their homes by the Natchez and united with the Caddoes in 1731. They made homes in rough dwellings covered with sod. Certain phases of their religious practices demanded human sacrifice.

NATCHITOCHE, năk'i-tôsh, town, Louisiana, parish seat of Natchitoches Parish, on Cane River (near the Red River), and on the Texas and Pacific Railroad, about 150 miles in direct line northwest of Baton Rouge. The town is on the site of what was once a French trading post established in 1714. It is situated in an agricultural region in which the chief products are cotton, beef cattle, poultry, milk, corn, hay, oats, potatoes, sugarcane, sweet potatoes, peas, soybeans, and truck vegetables. The principal industries of the town are connected with the preparation and shipment of the agricultural products, livestock, and gas. It also manufactures lumber, cottonseed oil, bricks, and beverages. It is the seat of a Northwestern State College. Pop. (1950) 9,914.

NATHAN, Hebrew prophet in the time of David and Solomon. He was in his day the latest direct descendant and representative of the school of the prophets under Samuel. Saint Jerome mentions a Jewish tradition which identifies him with the eighth son of Jesse, but there is no ground for this supposition. His earliest appearance in the history of David is as the king's counsellor, first advising the building of the temple and then after a vision announcing that the time had not yet come (about 1010 B.C.). His power, eloquence and tact as a prophet are shown by his exquisite apologue of the ewe lamb which brought David to a sense of his guilt in the case of Bathsheba (1000 B.C.). On the birth of Solomon the prophet named the child Jedidiah, "friend of the Lord," and was entrusted with his education. When the end of David's reign approached Nathan advocated the succession to Solomon, counseled Bathsheba to secure it, and rebuking the indifference of the king obtained his presence

and assistance at the inauguration of his successor (977 B.C.). Nathan's sons occupied high posts in the new court, Nabud being "the king's friend" and principal officer or chamberlain, while Azariah was over the "twelve officers which provided victuals for the king and his household." It was in accordance with the counsels and suggestions of this prophet that David, the year after his son's accession, crowned the work of his life, as poet, musician and promoter of a rich temple ritual, by introducing into public worship an orchestra of Levites. Eccles. ix, 14-16, a passage attributed to Solomon, is evidently an imitation of 2 Sam. xii, 1-4, which shows how the influence of Nathan was perpetuated in the literature of succeeding ages. In I Chron. xxix, 29, and II Chron. ix, 29, he is mentioned as historian of the reigns of David and Jonathan. He died about 935 B.C., and his grave is still pointed out at Halhul, five miles north of the ancient Hebron. An echo of his parable of the rich man with many flocks is found in the Koran Sura xxxviii, 20-25.

NATHAN, George Jean, American dramatic critic and magazine editor: b. Fort Wayne, Ind., 15 Feb. 1882. He was educated at Cornell University and entered journalism in 1904. In 1906 he became dramatic critic to the *Bohemian Magazine*, in 1908 to *Harper's Weekly*, and in the same year to *The Smart Set*. Since 1906 he has contributed articles on the current drama to many other magazines, and has also written for a newspaper syndicate. In 1914 he became part owner of *The Smart Set* and joint editor with H. L. Mencken (q.v.). In 1924 with Mr. Mencken, he founded the *American Mercury*, and was an editor for one year, after which he was contributing editor. His publications include 'Europe After 8.15' with H. L. Mencken and W. H. Wright (1914); 'Another Book on the Theatre' (1916); 'Bottoms Up' (1917); 'Mr. George Jean Nathan Presents' (1917); 'A Book Without a Title' (1918); 'Comedians All' (1919); 'The American Credo,' with H. L. Mencken (1920); 'The House of Satan' (1926); 'Heliogabalus,' a play, with H. L. Mencken (1920); 'The Eternal Mystery' (1913); 'Art of the Night' (1928); 'Monks are Monks' (1929). See also Kozlenko, 'Quintessence of Nathanism' (1930). Nathan's criticism is marked by independence of academic standards, and extensive knowledge of dramatic literature.

NATHAN, Maud, American reformer: b. New York, 1862. She was educated at private school and Green Bay, Wis., High School. In 1880 she married Frederick Nathan; was speaker before the International Congress of Women, in London (1899), at Berlin (1904) and International Peace Congress, New York (1907), and International Conference of Consumers' Leagues, Geneva (1908). In 1908 she was also a delegate at the International Congress for Labor Legislation, Lucerne (1908), since which she has preached and lectured in the principal cities of the country. She was a delegate to the International Woman Suffrage Convention at Stockholm (1911) and at Budapest (1913) and numerous other conferences abroad. She has been president of the Consumers' League of New York (1897-1917) and vice-president of the National Consumers' League.

NATHAN THE WISE, Lessing's immediate occasion for writing 'Nathan der Weise' ('Nathan the Wise,' 1799) was the necessity of finding a form, to which the censor could take no exception, for final utterance of some sentiments on the subject of personal religion which he had very much at heart. During a controversy with the Pastor Goeze in Hamburg he had had abundant experience of the pharisaical intolerance of the Lutheran orthodoxy of his day; and, on the other hand, his dear friend Moses Mendelssohn gave him an example of one of the gentlest, most enlightened of spirits in a member of a despised and persecuted sect. The idea of a dramatic poem on the subject of 'Nathan' goes back, however, some 25 years before this time.

The central *motif* Lessing adapted to his purposes from one of the stories of Boccaccio ('Decameron,' first day, third novel): Saladin, desiring to extort money from the Jew Melchizedek, invites him to declare which is the true religion. The Jew begs leave to tell a story: a father, possessed of a precious ring and having three sons equally dear to him, causes two rings to be made so nearly like the true one that he himself can hardly tell which is which, gives each son one ring, and nobody can decide who is heir of the original. So it is with the three principal religious faiths. Lessing's version attributes to the true ring the special virtue of making its wearer acceptable in the sight of God and man, provided he wears is confident of that effect. Proof, then, for each son that his ring is genuine will appear in the use that he makes of it. The moral is obvious: faith is the working out of salvation, not the possession of the truth. And from this follows a sufficient principle of conduct: act so as to deserve, and the right that you earn is right indeed, so far at least as any human being can judge. Translated by Ellen Frothingham (New York 1892), and by E. K. Corbett (London 1883). Edited by G. O. Curme (New York 1898) and by J. C. Robertson (Cambridge, England 1912).

WILLIAM G. HOWARD.

NATHANAEL, one of the earliest believers in and follower of Christ. He was a native of Cana in Galilee and attached himself to Jesus on becoming convinced of the Messiahship of the son of Mary by his miraculous insight and power of reading the heart (John i, 46-49). On the hypothesis that he was one of the 12 he has been identified with Bartholomew, but on insufficient grounds. There is a tradition that Nathanael was the bridegroom at the marriage at Cana, and Epiphanius implies that he was one of the two disciples whom Jesus overtook on the way to Emmaus.

NATHORST, nāt'hörst, **Alfred Gabriel**, Swedish scientist: b. Wäderbrunn, near Nyköping, 7 Nov. 1850. He studied at Lund and Upsala, served (1874) as privat docent in geology at Lund and (1873-84) as geologist on the royal Swedish geological research, becoming (1885) intendant of the palaeontological plant collection of the Stockholm Riks Museum. In 1870 and 1882 he was exploring in Spitzbergen and (1873-84), in south and central Sweden. In 1883 he accompanied the Nordenskiöld expedition to Greenland and (1898) led an Antarctic

expedition. His researches in glacial flora fossils were fruitful. He died in 1921.

NATICA, a genus of sea-snails, forming the type of the family Naticidae. The shell is globose in form, the spiral portion being minute and indistinctly marked, smooth and porcelain-like and its aperture of large size and semicircular form. The animal appears large in proportion to the shell, the foot especially being extensive. The mantle-lobes partly conceal the shell, and an operculum is always present. Most of the genera of this family are marine.

NATICK, nă'tik, town, Massachusetts, in Middlesex County; altitude 158 feet; on the Charles River; 18 miles southwest of Boston; on the Boston and Albany Railroad. The chief manufactures are boots, shoes, saws and edge tools, paper boxes, and baseballs. The town was founded in 1651 by John Eliot (q.v.), as the first of his thirty Praying Towns, which he hoped to make centers of Christian education among the Indians. A monument in honor of John Eliot is in South Natick. A boulder memorial on the Natick Common marks the Henry Wilson tree, planted by "the Natick cobbler" who became vice president of the United States (1873-1875). Natick was incorporated as a town in 1781. Pop. (1940) 13,851; (1950) 19,838.

NATION, Carry Amelia Moore, American temperance agitator: b. Garrard County, Ky., Nov. 25, 1846; d. Leavenworth, Kan., June 9, 1911. After brief and sporadic schooling, Carry Moore attended Missouri's State Normal School and received a teaching certificate. In 1867 she married a young physician and Union Army veteran, Dr. Charles Gloyd, an alcoholic. Unable to reform him, they separated, and six months later Gloyd died of alcoholism leaving her with an infant daughter Charlien, who lived to a weak and insane maturity. For the next four years she taught in a primary school at Holden, Mo., and in 1877 married David Nation, a lawyer, minister and editor, nineteen years her senior. In 1901, while they were living at Medicine Lodge, Kan., Nation divorced her on grounds of desertion. Meanwhile she had organized a local branch of the Woman's Christian Temperance Union and begun her campaign against the "joints," illicit saloons flourishing in the "dry" state of Kansas. Her first use of a hatchet to destroy property occurred in 1900 when she invaded Wichita and wrecked several saloons. She then descended upon Enterprise, Danville, Winfield, Leavenworth, and the state capital Topeka. Later she continued her hatchet crusade in San Francisco and eastern seaboard cities. Arrested some 30 times on charges of disturbing the peace, she paid her fines from her earnings in the sale of souvenir hatchets, lecture tours and stage appearances. Though sometimes earning as much as \$300 per week, she never became wealthy. She gave large sums to the poor and to temperance projects and built a home for drunkards' wives in Kansas City, Kan. Afflicted with hereditary paranoia (her mother and maternal grandmother were insane), her violent tactics, which made her a choice subject for the cartoonists, embarrassed the majority of temperance reformers and she never received the unqualified endorsement of any of the national

bodies. Consult her autobiography, *The Use and Need of the Life of Carry A. Nation* (1904).

NATION. See NATIONALITY; NATIONALISM.

NATIONAL ACADEMY OF DESIGN. An American association devoted to the fine arts, membership in which is limited to 125 painters, 25 sculptors and 25 architects and engravers. In 1906, joined by the Society of American Artists (q.v.), the National Academy became affiliated with Columbia University and the Metropolitan Museum of Art. The school of design, conducted since 1825 in connection with the academy, is located at Amsterdam Avenue and 109th Street and is open for instruction from October to May; the home and exhibition building of the society is at 1083 Fifth Avenue. The instructors in the school are selected from the governing council of the academy, which consists of its officers and six members. First known as the New York Drawing Association, a secession in 1825 of young artists from the first academy of arts in New York founded in 1802, the present name was adopted in 1828.

NATIONAL ACADEMY OF MUSIC (ACADEMIE NATIONALE DE MUSIQUE; also called the THEATRE NATIONAL DE L'OPERA), French institution founded by Louis XIV in 1669, the official title of the Paris Opera. The first composer of eminence connected with the institute was the Italian Lully, who became a naturalized French subject and gained control of the institute in 1672. The present building of the institute was opened in 1875 and is one of the finest of its kind in the world.

NATIONAL ACADEMY OF SCIENCES. Established by an Act of Congress approved by President Lincoln March 3, 1863, the charter of the National Academy of Sciences directs that it "shall, whenever called upon by any department of the Government, investigate, examine, experiment, and report upon any subject of science or art, the actual expense of such investigations, examinations, experiments, and reports to be paid from appropriations which may be made for the purpose, but the academy shall receive no compensation whatever for any services to the Government of the United States." Membership is by election, in recognition of outstanding achievements in scientific research, and is limited to 350 active members and 50 foreign associates. Members must be citizens of the United States. New members are elected by the academy on nominations from its 11 sections: Mathematics, Astronomy, Physics, Engineering, Chemistry, Geology and Paleontology, Botany, Zoology and Anatomy, Physiology and Biochemistry, Pathology and Bacteriology, and Anthropology and Psychology.

Publications of the academy include its *Annual Report* to the Congress of the United States; *Biographical Memoirs* of its deceased members; occasional scientific *Memoirs*; and *Proceedings*, issued monthly, and devoted to condensed reports of the most recent achievements in scientific research by members of the academy and the National Research Council, or by persons introduced by members.

The academy building is at 2101 Constitution Avenue, Washington, D.C.

NATIONAL ARCHIVES AND RECORDS SERVICE (NARS). The National Archives and Records Service is a part of the General Services Administration. It superseded the National Archives Establishment, an independent agency created by Congress in 1934, which was transferred to the General Services Administration effective July 1, 1949. NARS is headed by the archivist of the United States. It consists of the Records Management Division, the National Archives, the Federal Register Division, the Franklin D. Roosevelt Library at Hyde Park, N. Y., and the National Historical Publications Commission.

NARS prescribes standards and methods for the efficient management of the government's current records; supervises the administration of records centers, where noncurrent records being processed for disposal are stored inexpensively; selects, preserves, and administers in the National Archives those federal records that have enduring value; publishes the *Territorial Papers of the United States*, the *daily Federal Register*, the *Code of Federal Regulations*, the *Statutes at Large*, the *U.S. Government Organization Manual*, and the *Handbook of Emergency Agencies*; and administers the papers and collections of Franklin D. Roosevelt and related materials in the Library at Hyde Park. The National Historical Publications Commission serves as the staff agency of the federal government in planning national programs for collecting, preserving, and, on a selective basis, publishing archival and other manuscript materials important for an understanding of the history of the United States, and in cooperating with and assisting federal, state, and nongovernmental institutions in carrying out those programs.

More than 1,000 reference services a day are performed on the 872,000 cubic feet of permanently valuable records in the National Archives, which include maps, motion pictures, sound recordings, and still pictures. There is a general *Guide to the Records in the National Archives* (1948); and the *National Archives Accessions* lists current acquisitions. Records relating to World War II are described in a 2-volume handbook, *Records of World War II* (1950-1951). Other materials descriptive of records on deposit in the National Archives are issued from time to time in the form of inventories, reference information papers, and special lists of documents. To make entire bodies of research materials available to scholars and institutions, the National Archives reproduces them on microfilm and sells positive prints at cost. Individual documents of historic significance are also reproduced in exact facsimile for sale as teaching aids.

WAYNE C. GROVER,
Archivist of the United States.

NATIONAL ASSEMBLY (also known as the **CONSTITUENT ASSEMBLY**), a body established in France in 1789. Upon the convocation of the States-General by Louis XVI, the privileged nobles and clergy refused to deliberate in the same chamber with the commons, or *tiers-état* (third estate). The latter, therefore, on the proposition of the Abbé Siéyès, constituted themselves an *Assemblée Nationale*; with legislative powers, June 17, 1789. They bound themselves by oath not to separate until they had furnished France with a constitution, and the court was compelled to give its assent. In the 3,250 decrees

passed by the assembly were laid the foundations of a new epoch, and having accomplished this task, it dissolved itself Sept. 30, 1791. The term is also applied to a joint meeting of the Senate and Corps Legislatif, for the purpose of electing a chief magistrate or the transaction of other extraordinary business. See also *FRANCE—Revolution and Consulate: 1789-1804*. (The National Assembly).

NATIONAL ASSOCIATION OF MANUFACTURERS, The. A convention, consisting of several hundred representative American manufacturers, met in Cincinnati, Ohio, Jan. 22, 1895, and provided for the organization of a national association of manufacturers. At the first annual convention of the association held in Chicago Jan. 21, 1896, the name "The National Association of Manufacturers of the United States of America" was adopted, a preamble setting forth the objects of the association was published, and a constitution was adopted. The constitution has been revised, elaborated and amended several times to cover the constantly expanding activities of the association.

The general objects for which the association works are: (1) the promotion of the industrial interests of the United States; (2) the fostering of the domestic and foreign commerce of the United States; (3) the betterment of the relations between employers and their employees; (4) the protection of the individual liberty and rights of employer and employee; (5) the dissemination of information among the public with respect to the principles of individual liberty and ownership of property; (6) the support of legislation in furtherance of those principles and opposition to legislation in derogation thereof.

The association has standing committees on the following subjects: agricultural cooperation; economic policy; economic security; educational cooperation; employment relations; government finance; healthful working conditions; industrial economics; industrial financing; industrial practices; national defense and industrial mobilization; patents and trade-marks; public relations; relations of government to industry; scientific research study of depressions; tariff and transportation.

To advise the standing committees in their deliberations, the association has a number of advisory groups. In addition, the association has been sponsoring the most widespread and complete program ever undertaken by organized industry to tell its story to the public through the National Industrial Information Committee.

The membership of the association consists of individuals, firms and corporations engaged in manufacturing. The annual dues are based on capitalization, and the entire income of the association is expended in the interests of its members. Branch offices are maintained at Washington, D.C., and San Francisco, Calif.

NOEL SARGENT,
Secretary.

NATIONAL AUDUBON SOCIETY.
See **AUDUBON SOCIETIES.**

NATIONAL CATHOLIC WELFARE CONFERENCE. Founded in 1919, its aims are to organize Roman Catholic activities in such fields as education, social welfare, immigrant aid, and youth guidance. The membership

includes all Roman Catholic bishops and archbishops in the United States. It publishes a monthly, *Catholic Action*, and supplies a news service to affiliated weeklies. Headquarters are in Washington, D.C. See also **CATHOLIC CHURCH, ROMAN**—*Catholic Press of the United States*.

NATIONAL CEMETERIES are burial grounds instituted by act of Congress for the interment of any member of the United States armed forces who dies in action, while on active duty, or a veteran whose last service has terminated honorably. The veteran's wife or husband may be buried in a national cemetery, according to certain regulations; and unmarried children under 21 years of age and unmarried daughters of any age may be buried in a national cemetery in a grave site in which the remains of a parent have been buried. There is no cost for the grave site in a national cemetery.

National cemeteries had their inception shortly after the American Civil War. Of the total interments, about 10,700 are those of Confederates, being mainly in the national cemeteries of Arlington, Camp Butler, City Point, Cypress Hills, Finn's Point, Fort Smith, Hampton, Jefferson Barracks, Little Rock, Philadelphia, Springfield, and Woodlawn. Today more than 500,000 honorably discharged veterans and members of their families rest in 91 national cemeteries. Of these cemeteries, 79 are under the Department of the Army and supervised by the Quartermaster General. The other 12 cemeteries are under the Department of the Interior. The following is a list of national cemeteries:

Alexandria, Pineville, La.	Fort Rosecrans, Point Loma, Calif.
Alexandria, Va.	Fort Sam Houston, Tex.
Andersonville, Ga.	Fort Scott, Kan.
*Andrew Johnson, Greenville, Tenn.	Fort Smith, Ark.
Annapolis, Md.	Fort Snelling, Minneapolis, Minn.
*†Antietam, Sharpsburg, Md.	*†Fredericksburg, Va.
Arlington, Ft. Myer, Va.	*†Gettysburg, Pa.
Balls Bluff, Leesburg, Va.	Glendale, Va.
Baltimore, Md.	Golden Gate, San Bruno, Calif.
Barrancas, Warrington, Fla.	Grafton, W. Va.
*Baton Rouge, La.	Hampton, Va.
*†Battleground, Washington, D.C.	Jefferson Barracks, St. Louis, Mo.
Beaufort, S. C.	Jefferson City, Mo.
Beverly, N. J.	Keokuk, Iowa
Camp Butler, Springfield, Ill.	Knoxville, Tenn.
Camp Nelson, Nicholasville, Ky.	Lebanon, Ky.
Cave Hill, Louisville, Ky.	Lexington, Ky.
Chattanooga, Tenn.	Little Rock, Ark.
City Point, Hopewell, Va.	Long Island, Farmingdale, L. I., N. Y.
Cold Harbor, Richmond, Va.	Loudon Park, Baltimore, Md.
Corinth, Miss.	Marietta, Ga.
Crown Hill, Indianapolis, Ind.	Memphis, Tenn.
Culpeper, Va.	Mills Springs, West Somerset, Ky.
*Custer Battlefield, Crow Agency, Mont.	Mobile, Ala.
Cypress Hills, Brooklyn, N. Y.	Mound City, Ill.
Danville, Ky.	Nashville, Madison, Tenn.
Danville, Va.	Natchez, Miss.
Fayetteville, Ark.	New Albany, Ind.
Finn's Point, Salem, N. J.	New Bern, N. C.
Florence, S. C.	Perryville, Ky.
Fort Bliss, Tex.	Philadelphia, Pa.
*†Fort Donelson, Dover, Tenn.	*†Poplar Grove, Petersburg, Va.
Fort Gibson, Okla.	Port Hudson, Zachary, La.
Fort Harrison, Richmond, Va.	Quincy, Ill.
Fort Leavenworth, Kan.	Raleigh, N. C.
Fort McPherson, Maxwell, Nebr.	Richmond, Va.
	Rock Island, Ill.
	Saint Augustine, Fla.
	Salisbury, N. C.
	San Antonio, Tex.

San Francisco, Calif.	Staunton, Va.
Santa Fe, N. Mex.	*†Stones River, Murfreesboro, Tenn.
Seven Pines, Richmond, Va.	*†Vicksburg, Miss.
*†Shiloh, Pittsburg Landing, Tenn.	Wilmington, N. C.
Sitka, Alaska	Winchester, Va.
Soldiers' Home, Washington, D.C.	Woodlawn, Elmira, N. Y.
Springfield, Mo.	*†Yorktown, Va.
	Zachary Taylor, Louisville, Ky.

* Under the Department of the Interior.

† Administered by the National Park Service; it also administers the military cemetery which is part of the Chalmette National Historical Park, La.

AMERICAN CEMETERIES OF WORLD WAR I IN EUROPE

(under the American Battle Monuments Commission)

Name	Location	Number of acres	Number of interments
Aisne-Marne	Belleau	34	2,179
Brookwood	England	4½	434
Flanders Field	Beigum	5	360
Meuse-Argonne	Romagne	130	13,969
Oise-Aisne	Seranges-et-Nesles	32	6,038
Somme	Bony	13	1,825
Saint Mihiel	Thiaucourt	30	4,139
Suresnes	Paris	7½	1,503
Total		256	30,447

Since World War II the Department of the Army has announced plans for establishment of national cemeteries at Honolulu, T. H., and San Juan, Puerto Rico. Fourteen permanent military cemeteries are to be established overseas to care for deceased of World War II whose next of kin have requested that final interment be made outside the continental limits of the United States. These will be located at Cambridge, England; Neuville-en-Condroz, and Henri Chapelle, Belgium; St. Laurent, Epinal, St. Avold, St. James, and Draguignan, France; Florence and Nettuno, Italy; Carthage, Tunisia; Margraten, Netherlands; Hamm, Luxembourg; and Fort McKinley, Philippine Islands.

NATIONAL CITY, city, California, in San Diego County, five miles from San Diego on San Diego Bay, and 10 miles from the Mexican border; altitude 200 feet. It is served by the Atchison, Topeka and Santa Fe Railway by bus from San Diego. Vegetables and citrus fruits are grown in the area, and the industries include commercial flower growing, light manufacturing, and vegetable packing.

Settled in 1868, the city, which is largely residential, was incorporated in 1887. Its government is by city manager and five councilmen. Pop. (1950) 21,132.

NATIONAL CITY BANK OF NEW YORK, The, chartered June 16, 1812, under "An Act to incorporate the stockholders of the City Bank of New York," may be said to be a direct offspring of Alexander Hamilton's First Bank of the United States. The circumstance which led to the establishment of the new bank was the refusal of Congress to renew the charter of the First Bank of the United States, which, since its establishment in 1791, had been the most important financial institution in the country. The closing of this bank created a need for additional banking facilities in New York City, and the new institution was designed to fill this need.

Three days after the New York State legislature granted the charter to the City Bank of

New York, the directors met and elected officers. They arranged that holders of stock in the First Bank of the United States, which was then liquidating, might exchange that stock upon equitable terms for stock in the City Bank. This offer was availed of to the extent of 10,000 shares, which comprised more than a majority of the original capital. The authorized capital of the bank was \$2,000,000 in shares of \$50 each, but it commenced business with \$800,000 of capital paid up. The City Bank then opened for business in the offices which formerly had been occupied by the New York branch of the First Bank of the United States, 52 Wall Street, and remained in that location until it moved in 1908 into its present home at 55 Wall Street.

Upon the establishment of the national banking system in 1864 the bank surrendered its state charter and, in 1865, entered the new system as The National City Bank of New York. The efforts of its management have always been energetically directed toward broadening and perfecting the service of the institution for the accommodation of the rapidly expanding interests of business and individuals throughout the United States and abroad. The Farmers' Loan and Trust Company was affiliated in June 1929, at which time there was a reorganization of the National City organization under which the trust company became the City Bank Farmers Trust Company. In November 1931, the Bank of America was absorbed, thereby increasing its resources and further developing the National City system of branches serving various communities throughout greater New York City.

The bank has been active in developing American foreign trade, and was the first American national bank to establish foreign branches. The National City Bank now has branches, affiliates and correspondents in every important financial and commercial city of the world.

In June 1921, following its absorption of the Commercial Exchange National Bank, the National City Bank began to open branches in New York City. On Dec. 31, 1949, it operated 67 such branches. During the previous 109 years, its sole place of business in New York City had been at its head office, located in Wall Street.

NATIONAL CONFERENCE OF SOCIAL WORK. The, was organized in 1873 for discussion of the problems and methods of practical human improvement; it was formerly known as the NATIONAL CONFERENCE OF CHARITIES AND CORRECTIONS. Membership exceeds 5,500 persons and agencies concerned with problems of social welfare. A quarterly *Bulletin* and an annual volume of *Proceedings* are published. Its office is in Columbus, Ohio.

NATIONAL CONSUMERS' LEAGUE. The, was organized in 1899 by Florence Kelley, who believed that consumers who sought cheap markets regardless of how cheapness was brought about were responsible for some of the worst evils from which workers suffered. The league began to inform the public in an effort to promote better working conditions. It investigated the conditions under which goods were made, so that the purchaser might be able to identify the product of those factories which maintained good standards. It chose the stitched cotton underwear industry for women and children for its first investigation, and as a result products

of factories complying with league standards were labeled so that purchasers could be guided in their buying. The league label, having served its purpose while the needle trades were still unorganized, gave way to the union label in 1918.

In 1904 the league published the first handbook of child labor laws to be issued in the United States, and it continued thereafter to work vigorously for establishment of the Federal Children's Bureau. When congressional measures to limit child labor by federal control were declared unconstitutional, the league campaigned for ratification of the Child Labor Amendment. For a quarter of a century it fought to free women from overwork, publishing facts concerning effects of long hours and industrial strains on women which proved to the public the need for regulation by law.

Earlier state legislation for a minimum wage having been found unconstitutional, in 1933 the league drafted a new minimum wage bill which was quickly passed by seven state legislatures. In 1937 the Supreme Court of the United States upheld the constitutionality of the minimum wage. The league has defended labor laws, and it helped secure passage of the Federal Fair Labor Standards Act of 1938. After World War II the league campaigned for improvement of the act, and endorsed expanded social security and national health insurance. Headquarters are in Cleveland, Ohio.

ELIZABETH S. MAGEE,
General Secretary, National Consumers' League.

NATIONAL CONVENTION, a French revolutionary assembly (Sept. 21, 1792–Oct. 26, 1795), elected by universal suffrage as a constitutional and legislative body. The third assembly of the deputies elected by the French people after 1789 decreed the suspension of the king on Aug. 10, 1792, and voted the election of the National Convention which was constituted in the hall of the Tuileries on Sept. 19, 1792. The first session was held the following day, and the Convention was installed on the 21st. The history of this body is divided into three periods.

In the first period (Sept. 21, 1792–June 2, 1793), its first act was to make France a republic, which it did on Sept. 22, 1792, by abolishing the throne. This was followed by the trial of Louis XVI (q.v.) on Jan. 15, 1793,¹ his sentence to death the following day, and his execution on Jan. 21, 1793. Internal dissension arose between the leftist party, the Mountain, whose members were known as Montagnards, and the Girondists, resulting in the overthrow of the latter on June 2, 1793.

During the second period (June 2, 1793–July 27, 1794), the Convention, under the dictatorship of Robespierre who in turn was influenced by the Jacobins, created the Revolutionary Tribunal in October 1793 which sent thousands of its political opponents to the guillotine in what was known as the Reign of Terror (q.v.). However, the Montagnards were divided into three factions, one with Robespierre as the leader, and rival groups which were led by Jacques René Hébert and Georges Jacques Danton, both of whom were executed in the spring of 1794.

In the last period, the moderate party, which

¹ The 14th according to some authorities.

was known as the Thermidoreans, ultimately triumphed with the execution of Robespierre on July 28, 1794. A regime of reaction was initiated against the excesses of the Terror, and the Thermidoreans defended themselves against attacks by the Montagnards and the Royalists. After governing France for three years, the Convention dissolved on Oct. 26, 1795. It had drawn up the republican document called the Constitution of the Year III which was implemented by the succeeding government of the Directory. The Convention witnessed France's victory over a European coalition and the annexation of the Austrian Netherlands. It saw the establishment of the metric system and the inauguration of many scientific and cultural institutions. See also FRENCH REVOLUTION.

NATIONAL CONVENTIONS. See CONVENTION, POLITICAL.

NATIONAL COUNCIL OF THE CHURCHES OF CHRIST IN THE UNITED STATES OF AMERICA.—The National Council is a fellowship of 30 nationwide communions (25 Protestant and 5 Eastern Orthodox), with more than 35,000,000 members that desire to cooperate in all their common tasks. It is a practical expression of the unity of spirit and purpose which Christian people have because of their common loyalty to Christ.

The Council was established at Cleveland, Ohio, on Nov. 29, 1950. This was made possible by the decision of eight interdenominational agencies, to combine their forces; said decision having been authorized by their constituent communions and boards. These eight agencies, which by their official action transferred their functions and responsibilities to the National Council, were:

Federal Council of the Churches of Christ in America
Foreign Missions Conference of North America
Home Missions Council of North America
International Council of Religious Education
Missionary Education Movement of the United States and Canada
National Protestant Council on Higher Education
United Council of Church Women
United Stewardship Council

Five additional agencies later decided to merge their interests in the National Council:

Church World Service
Inter-seminary Committee
Protestant Film Commission
Protestant Radio Commission
Student Volunteer Movement

The National Council is the direct creation of the churches themselves. Its constitution was officially ratified by the highest authority of each of the thirty member denominations. The council is directly responsible to the denominations as officially represented at the General Assembly which meets biennially and the General Board which meets bimonthly.

The National Council encourages Christian churches to cooperate with each other and maintains close working relationships with more than 900 state and local Councils of Churches and a still larger number of state and local Councils of United Church Women and Interdenominational Ministerial Associations throughout the nation.

Non-member communions which share the basic faith in Jesus Christ as Divine Lord and Saviour may become members of the National Council under the provisions outlined in the constitution.

The National Council of Churches is an incorporated body, pursuant to the Membership Corporation Law of the State of New York, with its principal offices located at New York, N. Y.
J. QUINTER MILLER,
Assistant General Secretary.

NATIONAL EDUCATION, Systems of. See EDUCATION, NATIONAL SYSTEMS OF.

NATIONAL EDUCATION ASSOCIATION OF THE UNITED STATES (NEA), The. A professional organization of teachers, school officials, and others engaged and interested in educational work, incorporated by act of the United States Congress "to elevate the character and advance the interest of the profession of teaching and to promote the cause of education in the United States." Headquarters offices of the organization since 1918 have been located in its own seven-story building, 1201 Sixteenth Street, N. W., Washington, D.C.

History.—The first teachers' association in the United States was the Society of Associated Teachers organized in New York City in 1794. Other early significant educational organizations leading to a recognition of the need for a national association were: the American Institute of Instruction established in Boston 1830; the Western Literary Institute and College of Professional Teachers organized in Cincinnati 1831; and the American Association for the Advancement of Education held its first meeting in Philadelphia in 1849 with Horace Mann as presiding officer. By 1857 more than 20 state teachers' associations had been formed beginning with Rhode Island, New York, and Massachusetts. In August 26, 1857, 43 representatives of 10 of the state teachers' associations met in Philadelphia and organized the National Teachers' Association. That name was used until the organization united with the American Normal School Association and the National Association of School Superintendents in 1870 to form the National Education Association.

First incorporated, Feb. 24, 1886, under the laws of the District of Columbia, the organization was reincorporated by a special act of Congress with its present name, National Education Association of the United States, June 30, 1906.

By 1920 the increasing membership of the organization brought about an urgent need for some type of representative government. An amendment to the charter approved July 9, 1920, provided for the present representative assembly by which only elected and accredited delegates participate in the parliamentary sessions of the organization. Delegates to the representative assembly are elected by affiliated state and local associations, each organization being entitled to a number of delegates proportional to its members who belong to the NEA.

Membership.—The NEA is the largest professional organization in the world, reaching a record membership in 1948 of 441,127.

Beginning with the 10 state associations which created the national organization in 1857, the

state associations have continued in close cooperation and coordination with the NEA. All of the state teachers' associations of the 48 states, the District of Columbia, and three Territories, Hawaii, Alaska, and Puerto Rico, are affiliated with the National Education Association. The combined membership of these state and territorial associations is in excess of 800,000.

Finances.—The NEA is supported almost entirely by membership dues supplemented by income from advertising, sales of publications, and convention exhibits. Life membership dues, raised from \$100 to \$150 in 1948, have been used to purchase the headquarters office building and create a fund for further plant expansion.

Departments.—With increasing specialization in education, the number of the departments of NEA grew until in 1948 there were 29 as follows: Adult Education; American Association for Health, Physical Education, and Recreation; American Association of Colleges for Teacher Education; American Association of School Administrators; American Educational Research Association; American Industrial Arts Association; Association for Supervision and Curriculum Development; Audio-Visual Instruction; Classroom Teachers; Elementary School Principals; Higher Education; Home Economics; International Council for Exceptional Children; Kindergarten-Primary Education; Lip Reading; Music Educators National Conference; National Art Education Association; National Association of Deans of Women; National Association of Journalism Directors of Secondary Schools; National Association of School Secretaries; National Association of Secondary-School Principals; National Council for the Social Studies; National Council of Administrative Women in Education; National Science Teachers Association; Rural Education; Secondary Teachers; Speech Association of America; United Business Education Association; and Vocational Education.

Publications.—The association publishes annually about 500 million impression pages, including magazines, bulletins, books, and leaflets. The publication of widest distribution is the *NEA Journal*.

NATIONAL FORESTS. See NATIONAL PARKS AND MONUMENTS.

NATIONAL GALLERY, The, the British national art gallery; a collection of paintings, in Trafalgar Square, London. It originated in a collection formed by J. J. Angerstein, consisting of 38 pictures, 29 by old masters and nine by British painters, and purchased with public funds in 1824 for \$280,000 as the nucleus of a national gallery. Since that time the collection has been greatly enlarged by purchases out of funds provided by Parliament, as well as by bequests and gifts.

The National Gallery now comprises over 4,500 pictures and though specially strong in examples of the British school of painting, foreign masters are fully represented. The various early and late Italian schools are extensively illustrated; there are good examples of the chief representatives of Italian art, as Raphael, Correggio, and Paul Veronese. There are also good examples of Murillo and Velázquez and the Span-

ish school, and among the great Dutch and Flemish painters, Rembrandt, Rubens, Van Dyck, are well represented. The original building of the National Gallery dates from 1838 but has since had additions to accommodate the increasing collection. See also NATIONAL PORTRAIT GALLERY.

NATIONAL GALLERY OF ART. See SMITHSONIAN INSTITUTION.

NATIONAL GEOGRAPHIC SOCIETY, The. Founded in Washington, D.C., in 1888 for the "increase and diffusion of geographic knowledge," the society publishes the *National Geographic Magazine*, containing articles of wide geographic interest. Circulation to society members and to schools and other institutions exceeds 1,965,000.

Through the years, the society has sponsored—often in cooperation with other institutions—expeditions and research projects that have reached to the earth's poles, plumbed the ocean depths, soared to stratosphere heights, and peered into the darkness of interstellar space.

In addition to reproducing more than 1,000 natural-color photographs a year in its magazine pages, the society distributes every year as magazine supplements four large 10-color wall maps prepared in its own cartographic department.

Geographic news bulletins giving background information on places of current news interest are supplied to press and radio offices to the number of about 300 subjects a year. Weekly *Geographic School Bulletins* go to some 35,000 classrooms.

Gilbert Grosvenor has been editor of the *National Geographic Magazine* continuously since 1899, when the circulation was less than 1,000, and president of the society since 1920. Headquarters of the society are in Washington, D.C.

NATIONAL GUARD. Under MILITIA—*American Militia* there was traced the rise and fall of the militia system in the United States; and in the same article was indicated the genesis of the present National Guard. Not originating in any conception of universal military obligation but stemming entirely from a volunteer basis, the National Guard is made up of those citizens who choose to look upon soldiering as an avocation and carry on their military work in peacetime alongside of their normal occupations, trades, or professions. The units so formed are all controlled by the separate state governments. Unfortunately, as the National Guard grew, it became an ungainly thing. There was no uniformity within states, there was no integration among states. In the Spanish-American War the Cuban campaign showed conclusively that there was much to learn about mobilization. Secretary of War Elihu Root resolved to do something about the matter and, accordingly, instituted a study and rearrangement of American military organizations. Out of this came the passage of the Dick Bill in 1903. This divided the militia into (1) organized militia to be known as National Guard of the state and (2) a remainder known as reserve militia. Regular Army armament and discipline were prescribed as was instruction by Regular Army personnel. At the outset, the president was authorized to call this force for constitutional purpose for a period not to exceed nine months. In 1908 this time ban was lifted, as was the restriction on service outside the continental

limits of the United States. Upton's book on military policy, published in 1907, brought to light facts which, by their sharp sting of criticism, spurred the National Guard to renewed efforts to establish and maintain higher standards. In 1912, Attorney General Wickersham, passing on the Dick Bill amendment of 1908, ruled that it was his opinion that to move National Guard units outside the continental limits of the United States would be unconstitutional. In 1916, National Guard units were called into United States service "to protect against invasion, rebellion—." They spent six months on the Mexican Border, having enrolled nearly 100,000 men. When the United States declared war against Germany in 1917, these troops served as a rallying force around which to build the National Guard units necessary to supplement the Regular Army. The Selective Service Act of May 18, 1917 drafted the National Guard into federal service, and by subsequent War Department orders (General Orders 95 and 101, July 18 and Aug. 3, 1917, respectively) the Guard was distributed and formed into 16 National Guard combat divisions, each mobilized and trained in a separate camp. These organizations served with honor and distinction abroad for the period of the World War. When peace came, there was a rush to return to civilian pursuits and it became necessary to build the defense force anew.

Out of the welter of plans and suggestions advanced, came the adoption of the plan fostered by Gen. John J. Pershing and enthusiastically seconded by Maj. Gen. John F. O'Ryan, New York's noted World War commander of the 27th Division, A.E.F. This plan set up an "Army of the United States" to consist of three components: Regular Army, Organized Reserves, and National Guard, the latter to remain a state force under state control except for those periods when actually in federal service. The act of June 4, 1920 accomplished this set-up. Nothing was done to destroy local pride in any unit. Instead, there was increased federal aid of all kinds, broadened to preserve local tradition and honors won in outstanding military operations. The governor of each state is the commander in chief for his state, except when the Guard is in federal service. Arms, equipment, motor vehicles, and supplies come from Uncle Sam, who also pays wages for armory drills and for 15 days' field training per year (lengthened in emergency in 1940 by an extension of one week). The army's schools are open to the National Guard and its members receive full pay when in attendance there.

Amendments to the 1916 and 1920 acts created "The National Guard of the United States," distinct from "The National Guard" of the several states. They differ only in character, and the purpose accomplished by the latest amendment was that of making it possible, when Congress declares a national emergency, to order the National Guard into active service as federal troops, obviating the old, clumsy procedure of getting them by "calls" through the state governors.

In 1920, National Guard strength was 56,090; in 1940, it was 251,000. The National Guard participates annually in Regular Army field maneuvers. Its present organization is comprehended in 18 infantry and four cavalry divisions with a pro rata proportion of corps, army,

and GHQ reserve troops. It stands as a state force, available to quell disorders within state boundaries, and it is a definite part of the federal military force.

Associate Military Historian, Army War College.

NATIONAL HYMNS AND ANTHEMS.

Patriotic songs or airs played or sung on ceremonial occasions, fetes, and other public gatherings as a mark of respect to the country are generally known as national anthems or hymns. There is no very marked difference between a national hymn and an anthem, and many countries possess both. Where this is the case, the anthem has been made the official music of the nation by a legislative act or royal decree. It takes precedence over all other national hymns regardless of the affection and esteem in which they may be held. It may be an air without words or a march played by bands or orchestras to symbolize patriotism and loyalty. Love of fatherland and pride in one's country are the keynotes of most national anthems, and in many, religious feeling is blended with patriotic sentiment. National hymns and anthems are frequently closely related to the folk songs of a country or grow out of wars and revolutions. In most cases, both words and music are by a native composer.

Argentina.—*Oíd, mortales, el grito sagrado* (*Hear, O Mortals, the Sacred Call*) was written in 1813 by Vicente Lopez y Planes and set to music by José Blas Parera.

Australia.—*God Save the King* is the official national anthem of the Dominion, but it shares honors with a more local melody. On state and formal occasions when *God Save the King* is played, it is followed by the playing and singing of *Advance Australia Fair*. This Australian anthem was written about 1875 by P. D. McCormick.

Austria.—Before World War I, the national anthem of the empire was *Gott erhalte unsern Kaiser*, composed in 1797 by Franz Joseph Haydn. After the formation of the first republic, a new song was adopted, *Österreichische Bundeshymne*, with words by Karl Renner and music by Wilhelm Kienzl. It was officially proclaimed the national anthem on Dec. 13, 1929. During the time of chancellors Engelbert Dollfuss and Kurt von Schuschnigg, it was compulsory to follow the national anthem with the party song *Lied der Jugend*.

Belgium.—*La Brabançonne*, with music by François Van Campenhout (1779–1848) has had three sets of words since it was first sung at the Théâtre de la Monnaie in Brussels on Sept. 12, 1830. At that time Belgium was still part of the Kingdom of the Netherlands, under the House of Orange. The original version pledged loyalty to the orange provided that it should ripen on the tree of liberty. The second version, written during the street fighting in which Bel-

gium won its independence, was strongly anti-Dutch. Words of the early versions were by "Jenneval," stage name of the French comedian Hippolyte Louis Alexandre Dechet (1801-1830), who was killed fighting for Belgian freedom. The third and last version was written in 1860 by Charles Rogier so that the anthem should be in keeping with the friendly relations between Belgium and Holland.

Bolivia.—*Bolivianes, el hado propicio*, with words by J. Ignacio de Sanjinés and music by Benedetto Vincenti, was played for the first time in 1842 and adopted the same year.

Brazil.—*Hymno da Proclamação da República* (*Hymn of the Proclamation of the Republic*) was composed by Leopoldo Miguez. The words are by Medeiros e Albuquerque.

Bulgaria.—*Shoumi Maritsa* (*The Bubbling Maritsa*), a river which flows through Bulgaria and Turkey. It was written by (?) Mareček and set to music by Gabriel Sebek.

Canada.—The Dominion of Canada probably comes as close as any other country to having two official national anthems. By law, *God Save the King* is the only official one, but by custom and usage, most Canadians look upon *O, Canada* as their national anthem. The words were originally written in French by Sir A. B. Routhier in 1880; the music is by Calixa Lavallée. The English adaptation was made in 1908 by R. S. Weir. On all state and formal occasions when the playing of the national anthem is in order, *God Save the King* is immediately followed by *O, Canada*. Still another highly popular national song is *The Maple Leaf Forever* with words and music written by Alexander Muir in 1867.

Chile.—*Dulce Patria*, the Chilean national anthem, was originally written as a poem in 1819 by the Argentine poet Bernardo de Vera y Pintado. Chile had just obtained its independence, and the poem was a harsh outcry against Spain. It was set to music in December 1828 by Don Ramon Carnicer. In 1847, the Chilean poet, Eusebio Lillo, wrote new verses for *Dulce Patria*, leaving the chorus as it was originally written.

China.—In 1924, Dr. Sun Yat-sen gave an address to the Whampoa Military Academy in which he discussed his three principles of democracy. Part of his text was taken for the national anthem, *San-Min-Chu-I* (*Three Principles of the People*) and set to music in 1928 by Ch'eng Mao-yun. Another of China's national songs and her most popular war song is *March of the Volunteers*, known also in the United States as *Chee-lai*. The words were by T'ien Han, and the music was composed by Nieh Erh.

Colombia.—*Himno Nacional* was officially adopted as the national anthem in 1921, although it had been written years earlier. The words were by Rafael Nuñez, written before he became president, and the music was composed by Oreste Sindice, originally an Italian and later a naturalized Colombian citizen.

Costa Rica.—*De la Patria*, the national anthem, was written by José M. Zeledón. Manuel M. Gutiérrez composed the music in 1821.

Cuba.—In about 1868, Pedro Figueredo wrote the words and music to Cuba's national anthem, *Himno Bayamés*.

Czechoslovakia.—The national anthem is divided in two parts: the first is Czech and the

second Slovak. They are always played together as a single anthem. The Czech part, *Kde domov můj* (*Where is my Native Land*), was originally a song in the musical comedy *Fidlovačka* by the Czech dramatist Josef Kajetán Tyl with music by František Skroup. It was first performed in Prague on Dec. 31, 1834. *Nad Tatrou sa blýska* (*It Storms Over the Tatra*) is the Slovak part of the Czechoslovak anthem. It was written in 1844 by the Slovak poet, Janko Matúška, to the tune of an old folk song.

Denmark.—The national anthem is *Kong Christian stod ved højen Mast* (*King Christian Stood by the Lofty Mast*). The words are by the Danish poet Johannes Ewald (1743-1781), and it was included as an aria in a musical piece by Ewald, *Fiskerne* (*The Fisherman*), written in 1779. There is some uncertainty as to who was the composer of the music. It was either Johann Ernst Hartmann (1727-1793), who composed the music to *Fiskerne*, or Ewald's friend, Ditlev Ludvig Rogert (1742-1813).

Dominican Republic.—*Himno Nacional*, with words by Emilio Prud'homme and music by José Reyes, is the official national anthem of the Dominican Republic. It was first played and sung in 1900.

Ecuador.—The official title of the Ecuadorian national anthem is *Himno Nacional del Ecuador*, but it is known sometimes by the opening words of the first stanza: *Salve, O Patria* (*Hail, O Fatherland*). The composer was Antonio Neumane, and the words were written by Juan León Mera. It was officially recognized in 1866.

Egypt.—*My Country, My Country, I Live for You* is the Egyptian royal hymn sung at patriotic gatherings. *A Royal Salute*, formerly known as the *Salaam, Effendi* (*March of the Khedive*) is played at the conclusion of popular gatherings and patriotic assemblies. The music is by Giuseppe Verdi, but it has, or had, no words.

Estonia.—Since its incorporation into the Soviet Union in 1940, Estonia has adopted the national anthem of the USSR. *Mu Isamaa*, the old anthem, is still played on formal occasions, but it no longer holds its former honored position. The music was the same as the Finnish national anthem composed in 1848 by Frederik Pacius. The words were written by J. Jannsen in 1865.

Ethiopia.—The music of the national anthem *Etiopia hoy*, was composed by M. K. Nalbandian, the Albanian band leader of the Imperial Guard in Addis Ababa, in 1925. The words were written in 1930 by a group of Ethiopian scholars.

Finland.—The Finnish national anthem was composed by Frederik Pacius, and the words were originally written in Swedish by a Finnish poet, Johan Ludvig Runeberg. The Finnish title is *Maamme* (*Our Land*), and the Swedish, *Vårt Land*. It was first sung May 13, 1848.

France.—*La Marseillaise*, perhaps the most famous national anthem and stirring martial music ever played, was written April 25, 1792, by Rouget de Lisle, a young engineer officer in the French army at Strasbourg. See also MARSEILLAISE, LA.

Germany.—During the Franco-Prussian War (1870-1871) and through World War I *Die Wacht am Rhein*, with words by Max Schneckenburger (1840) and music by Carl

Wilhelm (1854), was considered the national anthem. On Aug. 11, 1922, *Lied der Deutschen* was officially adopted. Also known as *Deutschland, Deutschland über Alles*, the music is the same as that of the old Austrian national anthem composed by Franz Joseph Haydn in 1797. The words were written by August Hoffman von Fallersleben in 1841. After the Nazi party took control of the German government in 1933, the *Horst Wessel Lied* by Ernst Hanfstaengl became an essential part of the national anthem, and by law it followed the playing of *Lied der Deutschen*.

Great Britain.—The authorship of words and music to *God Save the King*, national anthem of Great Britain, is doubtful. It is usually credited to Henry Carey (1740). The music to this anthem has been used for more national hymns than perhaps any other. It has been used at different times by the United States, Germany, Denmark, and Switzerland. See also *God Save the King*.

Greece.—The words to the Greek national anthem, *Hymn to Liberty*, were written in 1823 by Dionyssios Solomos on one of the Ionian Islands. Five years later it was set to music by Nicholas Manzaros, and when the islands were ceded to Greece by Great Britain in 1864, the *Hymn to Liberty* became the national anthem and was dedicated to King Othon of Greece.

Guatemala.—*Himno Nacional de Guatemala*, the national anthem, was composed by Professor Rafael Alvarez. The words were written by Dr. J. J. Palma.

Haiti.—In 1903, *La Dessalinienne*, Haitian national anthem was composed for the centenary celebration of the country's independence. The words are by Justin Lhérisson, and the music is by Nicolas Geffard.

Hawaii.—As a territorial possession of the United States, Hawaii's official national anthem is *The Star-Spangled Banner*. *Hawai'i pono'i*, however, has long been a favorite song among the native population. Words and music are believed to have been composed by King Kalakaua (1874-1891).

Honduras.—Augusto C. Coello, minister of foreign affairs of Honduras in 1927, wrote the words to the Honduran national anthem, *Himno Nacional de Honduras*. Carlos Hartling was the composer of the music. The anthem was selected as the result of a public competition sponsored by the Honduran government.

Hungary.—*Hymnusz*, the Hungarian national anthem, was written in 1823 by Ferencz Kolcsey and put to music by Francis Erkel in 1845. The playing of *Hymnusz* is frequently followed immediately by *Szózat*, another national song with words by Michael Vörösmarty (1836) and music by Benjamin Egressy.

Iceland.—*O Guð vors Land*, the national anthem of Iceland, was written by Matthías Jochumsson in 1874. The music was composed by Sven Sveinbjörnsson.

Iran.—The Iranian national anthem is *Shāhanshāh-i mā Zandah bādā* with words by S. Afsar and music by Lieut. Najmi Moghadam. It was officially adopted in 1934.

Iraq.—The *Iraq Salute*, the country's national anthem, was composed by Major A. R. Murray.

Ireland, Republic of.—The national anthem of Eire, formerly the Irish Free State, is *The Soldiers' Song*, officially adopted in July 1926.

The words are by Peadar Kearney, and the music was composed by Kearney and Patrick Heaney. It was first published in *Irish Freedom* in 1912.

Italy.—Until June 1946, *La Marcia Reale*, an instrumental march by Giuseppe Gabetti (1831), was the national anthem. While the Fascists controlled the government and until the defeat of Italy in World War II, the national anthem was always followed by the party song, *La Giovinezza* with words by Marcello Manni and music by G. Castaldo.

On June 2, 1946, date of the proclamation of the Italian Republic, the *Hymn of Mameli* was adopted as the national anthem. The words are from a poem, *Fratelli d'Italia*, by Goffredo Mameli, Italian poet and patriot who died July 6, 1872, from a bullet wound received in the battle of Villa Corsini. It was first put to music by Novaro and later by Giuseppe Verdi.

Japan.—*Kimi ga yo wa* (*Let Mikado's Empire Stand*) by Hayashi Hirokami is an old 9th century oriental air.

Latvia.—*Dievs, svētī Latviju* (*God, Bless Latvia*), the old Latvian national anthem, was written by Karlis Baumanis (1835-1905) for the National Singing Festival in 1873. Since Latvia became a republic of the Soviet Union in 1940 it shares honors with the national anthem of the USSR.

Lebanon.—The national anthem of Lebanon was adopted by presidential decree on July 12, 1927. The three verses were written in Arabic by Rachid Nakhle, and the music was composed by Wadia Sabra.

Liberia.—The words and music to *Salve Liberia, Salve!* (*All Hail, Liberia*) were written by Olmstead Luca in 1860.

Lichtenstein.—The words of Kaplan H. H. Jauch (1850) were set to the music of *God Save the King* to form the Lichtenstein national anthem, *Oben am deutschen Rhein* (*Above the German Rhine*).

Lithuania.—In 1918, the Lithuanian government officially adopted *Lietuva, Tėvynė Mūsų* as the national anthem. Words and music were written by Vincas Kudirka. Since 1940, when Lithuania was made part of the Soviet Union, the country has had two anthems: *Lietuva, Tėvynė Mūsų* and the new national anthem of all the Soviet Republics.

Luxembourg.—The official national anthem of the grand duchy of Luxembourg is *Ons Hemecht* with words by Michel Lentz in 1859 and music by J. A. Zinnen.

Mexico.—The Mexican national anthem, *Mexicanos, al grito de guerra*, with words by Francisco G. Bocanegra and music by Jaime Nunó dates from Sept. 16, 1854.

Monaco.—The Monégasque national anthem was conceived by Théophile Bellando de Castro, an official of the principality. He jotted it down on the corner of a table as the melody occurred to him one evening. The simple, stirring air was altered to some extent and refined by a distinguished musician, Castil Blaze, who was visiting in the principality. The result, known as the *Marche de Théophile Bellando, écrite et variée par Castil Blaze*, became the national anthem of Monaco.

Montenegro.—John Soundechitch wrote the words to *In Our Beautiful Montenegro*. The composer of the music is unknown.

Netherlands.—The national anthem is *Het*

Wilhelmus, also known as *Wilhelmus van Nassouwen*. The composer is unknown.

New Zealand.—The official national anthem for all public occasions in New Zealand is *God Save the King*, but the national song is *God Defend New Zealand*, which has never been officially adopted. The words of the song are by Thomas Bracken and the music by John J. Woods.

Nicaragua.—The music of the national anthem, *Patria Amada (Beloved Fatherland)*, has been used since early colonial days. The identity of its composer is obscure. In 1939, the words were officially changed, and verses of Salomon Ibarra were adapted to the old music. The opening line of the new anthem is as follows: *Salve a Ti, Nicaragua*.

Northern Ireland.—The national anthem of all of Great Britain is *God Save the King*.

Norway.—The Norwegian composer, Rikard Nordraak (1842-1866) wrote the music of the national anthem, *Sang for Norge (Song of Norway)*, to the words of his cousin, the author and poet Bjørnstjerne Bjørnson. It is sometimes known by the words of its opening line: *Ja, Vi Elsker Dette Landet (Yes, We Love This Country)*.

Panama.—The music of *Himno Nacional de Panamá*, the republic's national anthem, was composed by Santos Jorge, a Spanish musician who settled in Panama in 1889. The words were written by Jerónimo de la Ossa, Panamanian poet and engineer. It was written and composed in 1904, provisionally adopted by the National Assembly in 1906, and later, in 1925, was definitely proclaimed the official anthem of the republic by the same legislative body.

Paraguay.—*Paraguayos, República ó muerte!* with words by Francisco de Figueroa and music by Francés Dupuy is the national anthem of Paraguay.

Peru.—In 1821, General Jose de San Martin selected *Himno Nacional (Somos libres, seámoslo siempre, We are Free, Let Us Be So Forever)* as the official national anthem from six entrants in a contest for that purpose. The music was composed by Jose Bernardo Alcedo; words were by Jose de la Torre Ugarte. The anthem was officially played for the first time on Sept. 24, 1821.

Philippines.—On June 4, 1898, Julian Felipe, a Filipino music teacher and composer, began work on a national anthem. A week and a day later, on June 12, the Act of Proclamation of the Philippine Independence took place, and Felipe's composition was played for the first time. It was called *Marcha Nacional*. A year later the words were written by Jose Palma, a young poet and private soldier. His poem was called *Filipinas*, and the name was given also to the music. Until the Philippines received their independence on July 4, 1946, a playing of *Filipinas* was always followed by *The Star-Spangled Banner*.

Poland.—The words to Poland's national anthem, *Song of the Legions*, were written by Joseph Wybicki, a volunteer in Napoleon's Polish Legion under the command of Gen. Henryk Dąbrowski. The music is the composition of Michael Ogiński. Wybicki wrote only one stanza and chorus, and the song was originally only a stirring marching song for the legion. After the restoration of independent Poland, *Song of the Legions* was designated as the

national anthem of the Polish Republic.

Portugal.—*A Portuguesa* with words by Lopez de Mendonça and music by Alfredo Keil was written in 1890 and officially adopted as the national anthem in 1910.

Rumania.—A contest held in 1861 resulted in the selection of *Trăiască Regele (Long Live the King)* as the Rumanian national anthem. The words were by V. Alexandri, and the music was composed by Edward Hübsch (1833-1894), who was at the time general inspector of military bands in Rumania and leader of the National Theatre orchestra.

Salvador, El.—*Saludemos la Patria (Let Us Salute the Fatherland)* was written by Juan J. Canas. The music was composed by J. Aberle.

Saudi Arabia.—As of the end of 1947, Saudi Arabia's anthem had not been officially adopted. The composers were Sheikh Ahmed A. Jabbar, first secretary of the royal legation in Washington, D.C., and Sheikh Ali Alirza, a delegate to the United Nations from Saudi Arabia. It was first played on Jan. 12, 1947, on the occasion of the visit to the United States of H.R.H. Crown Prince Saud.

Scotland.—As in the case of all parts of Great Britain, *God Save the King* is the official national anthem. *Scots Wha Hae wi' Wallace Bled*, an ancient Scottish melody with words by Robert Burns (1793) calls forth a large degree of national sentiment but holds no official position.

* **Siam.**—*Sanrasoen Barami*, the national anthem, was composed in 1871 by an English bandmaster in Singapore named Hudson. It was done at the request of King Chulalongkorn (1868-1910) who then ordered a Siamese writer to apply Siamese words to the melody. Several alterations have been made in the wording since the original composition.

Spain.—Before 1937, Spain had no official national anthem although *Marcha Granadera*, popularized during the War of Independence against Napoleon, had attained general acceptance. In 1937, General Franco declared *Marcha Granadera* to be the national anthem, but no specific arrangement was decided upon, and it has no official words. It is generally played as a march rather than a hymn, and verses by M. Tomás are popular.

Sweden.—The official anthem is *Du gamla, du fria (Thou Old, Thou Free)*, written by Richard Dybeck (1811-1877) to an old folk melody which he had discovered in the central province of Västmanland. Dybeck was a noted Swedish author, composer, and folklorist, who made a careful study of the inscriptions on the Swedish rune stones from Viking days. In later years another song has become almost as beloved and popular although it is not designated as the official anthem. It is *Sverige (Sweden)*, with words by the Nobel Prize winning poet Verner von Heidenstam (1859-1940) and music by Wilhelm Stenhamner (1871-1927).

Switzerland.—The Swiss national anthem, *Rufst du, Mein Vaterland? (Callst Thou, My Fatherland?)*, with words by Johann R. Wyss (1811), is set to the music of *God Save the King*.

Syria.—The Syrian National Anthem, which has no other title, was written by the composer, Flayfel Bros, and adopted by the government in 1936.

* Now Thailand (1949).

Turkey.—*March of Independence*, the Turkish national anthem, was written as a poem in 1921 by Mehmet Akif Ersoy. On March 1 of the same year, the minister of public instruction read the poem to the Grand National Assembly. Eleven days later on March 12, 1921, *March of Independence* was officially declared the country's national anthem. Several different musical compositions have been written for Mehmet Akif's poem, but the final selection was that of the Turkish violinist, Zeki.

Union of South Africa.—*God Save the King* is the official national anthem, but *Die Stem van Suid-Afrika* is popular as an exclusively South African song. The author of the words is unknown, but the music was composed by M. L. de Villiers.

Union of Soviet Socialist Republics.—Before the Russian Revolution, the national anthem had been *Bozhe Zaria* (*Chransy* (*God Preserve the Czar*) with words by V. Joukovsky and music by A. F. Lvov. It was replaced by the *Internationale*, words by Eugène Pottier (1871) and music by Pierre Degeyter. During World War II, the *Internationale* was in turn replaced by a new song, known simply in English as the National Anthem of the Soviet Union. The music was composed by A. V. Alexandrov, and the words were written by Sergei Mikhalkov in collaboration with El Resistan.

United States.—On March 3, 1931, Congress established *The Star-Spangled Banner* as the official national anthem. The words were written by Francis Scott Key on Sept. 14, 1814, to an old English melody, *To Anacreon in Heaven*, by John Stafford Smith (1750–1836). See also STAR-SPANGLED BANNER.

Uruguay.—*Orientales, la patria ó la tumba!* (*Uruguayans, fatherland or death!*) was composed and written by Juan Copetti.

Venezuela.—The national anthem was written by two patriots who died in 1814 in the first revolutionary movement against Spain. Vicente Salias, who wrote the words, called his poem *Gloria al Bravo Pueblo* (*Honor to a Brave Nation*). He was executed as a rebel by Spanish forces in Puerto Cabello. It is traditionally said that he was shot with a copy of the anthem pinned on his chest as a target. Juan José Landaeza, the composer of the music, is believed to have been killed in Cumaná at about the same time.

Wales.—*God Save the King* is the official anthem, but as one of the most musical people in the world, the Welsh have many national songs and airs. One of the best is known as *March of the Men of Harlech* and commemorates the part played by the town of Harlech in the Wars of the Roses. Another favorite is *Mae hen wlad fy nhadan* with words by Evan James and music by J. James.

Yugoslavia.—On Nov. 17, 1946, the Presidium adopted a composition by Cedomir Minderović as the new national anthem. One year later it still had not been put to music, and the old anthem, *Hej Sloveni*, was being sung.

NATIONAL INCOME. The net income of an economy consists of the consumption of economic goods during the income period plus the net change in the stock of economic goods. Consumption, as used in this definition, means the use of economic goods by individuals, as individuals or members of family units, for the direct

satisfaction of their wants. The use of bread as food by a family or individual is a pertinent illustration; the use of wheat by a business firm to make flour, or flour to make bread, is not. When direct consumption is measured it includes all of the prior or auxiliary uses of intermediate commodities or services. This view assumes that the end purpose of an economy is considered to be the satisfying of the wants for economic goods of the individual members of society.

Economic goods include all scarce sources of satisfaction and may be material or nonmaterial. A source of satisfaction is said to be scarce if the quantity of it, relative to the wants for it, is not sufficient to meet completely the sum total of all such wants, and cannot be made to meet all such desires without the giving up of some other satisfactions. Thus, economic goods command prices which tend to restrict the demand for them to the quantities available or producible in competition with other economic goods.

The net change in the stock of economic goods over the income period is the difference between the quantity of such goods on hand at the end and the beginning of the income period. This difference may be positive or negative. If positive, it indicates that, in addition to the consumption of commodities and services produced during the period, the economic goods on hand at the end of the period exceed those at the beginning and, therefore, that any goods used up in the process of production have not only been replaced but added to. When the net change in stock is negative, consumption must have come partly from the stock of economic goods on hand at the beginning of the period as well as from production within the period. In the former case the economy was saving (investing), and building up its capital; in the latter it was dis-saving (dis-investing), and living off its capital. The net change in stock is added to consumption to obtain the economy's income or end product because all stocks of economic goods are essentially partly finished, final, consumption goods. Every factory building, machine, or item of materials inventory is gradually used up—that is, turned into final products.

As described above, the net income or net product of an economy is *net* in the sense that all resources used up in the income-creating process are deducted before arriving at the end product of the period. Allowances are made for the wearing out of durable productive equipment as well as the using up of less durable inventories. It is customary, however, not to deduct for the destruction of resources brought about by factors not usually associated with the income producing process, such as war or other catastrophes not generally included in the risks of business activity. Some income estimators make no deduction for depletion of natural resources, since such resources were not originally brought about by prior production. Furthermore, the net income, as described, is net not only because it allows for the using up of beginning stocks but because it also eliminates any double counting which would result from including, at successive stages, the products produced and used up during the income period, such as the wheat, the flour, and the bread.

The adjective "National" before income, refers to the income of an economy in some way bounded by the authority of a Nation. The economic area of a nation is ordinarily not restricted to its geographical boundaries so that its national

income need not be confined to what was produced within such boundaries. Usually national income refers to the income received by, or accruing to, individuals and family units domiciled within a nation. This definition excludes that portion of income produced within the geographic area of one nation but received by, or accruing to, individuals residing in other countries. It includes income received by, or accruing to, its inhabitants but produced within the boundaries of other nations. In terms of consumption and net savings, a nation's income may be defined as including (1) the consumption, by those domiciled within the nation, of economic goods produced both within and outside the nation, and (2) the net change in ownership by those domiciled within the nation of the worldwide stock of economic goods on hand at the end of the income period.

Measurement.—The above definitions have been in terms of the commodities and services themselves. To secure any meaningful quantitative total it is necessary to summarize the heterogeneous content of real income by the use of a money value. National income thus becomes the money value of the goods and services consumed plus the money value of the net change in resources. This leads to several difficulties when comparisons over a period of time or among nations are desired.

Since the value of money is itself subject to change, the measurements in successive periods of the market value of goods and services consumed do not give an indication of the change in consumption in real terms. This purpose can be realized reasonably well by correcting such money values for changes in the value of money. This can be done by the use of a price index which gives the changes in the weighted prices of representative commodities and services comprising the consumption-aggregate. It can never be done perfectly, since the consumption-aggregate changes its composition over a period of time and the qualities of individual goods also change. For periods of time not too far removed the price correction gives the money value in terms of constant prices. This provides an indication of the changes in physical volume if the composition and quality of the income content have not changed significantly.

Similar problems, but somewhat more difficult ones, must be solved in estimating the value in constant prices of the net change in resources. Here also we seek a measure of the real change in quantity. Capital gains resulting from either changes in the value of money or shifts in the conditions of scarcity and demand must not be included. Their exclusion is accomplished by taking the current income period market costs of gross additions to stock, and subtracting the current reproduction cost of the asset used up during the income period. The remainder thus obtained gives the value, in current prices, of the net change, and excludes capital gains. Such current price totals for different periods can then be corrected by an index of prices of capital goods, to give an indication of the real change in capital.

In the actual measurement of national income totals the general concepts set forth above are slightly modified. Want-satisfying services or commodities produced and consumed within the family are generally excluded. These exclusions are made because the members of the economy—individuals and family units—do not think of their own family activities as belonging to economic

activity proper. It is the social process of producing for each other by way of the market—the process of buying and selling for prices—that constitutes economic activity proper. Thus the services we perform for ourselves—dressing, washing, home gardening, home repair, and housewife services—are not included in the usual measurements of national income. Such exclusions must, however, be taken into consideration in any uses of national income totals for comparisons over time or among nations. Even within the same economy there may be significant shifts of activities from the market to the family. This may cause us to understate national income in depression as compared with prosperity. Between economies with different combinations of market and family activities of an economic character the error may be substantial.

One element of what might be called family-produced income is commonly included in the national income total, namely, the net rental value of owner-occupied homes. Also included are such items as farm produce consumed on the farm, since the output was primarily for the market. Similarly, payments received in kind by domestic servants and other workers for whom such payments are substantial, and which are important considerations in securing their services, are also included.

Because the family unit or individual is conceived of largely as a consuming unit rather than a producing unit, all consumption goods purchased by such units are considered to be consumed. It is consumers' outlay rather than consumption which is measured. Except for residential real estate, no capital accounts are kept for consuming units. The purchase of consumption goods is considered to be consumption even though the goods are not actually consumed during the income period in which they are acquired.

The measured totals of national income commonly include, therefore: (1) all outlays by consumers through the business markets for consumers' commodities and services; (2) government-provided commodities and services, and (3) net savings. The inclusion of government among the institutions participating in income creation presents a major problem not yet satisfactorily resolved. Government activities are not paid for in accordance with the usual voluntary market-price practices, but by taxes. They may be valued either in terms of the collective tax payments made or the costs incurred. The major problem, however, is to find a basis for allocating the value of such services, however determined, between direct and indirect services. This is easily done within the private business framework since purchases by one firm from another may be considered indirect goods. A corresponding interpretation of tax payments is highly arbitrary but provides one basis which has been used (Kuznets). Under this method, all taxes paid by business—direct or indirect—are considered payments for services to business, i.e., indirect goods. Taxes paid by individuals are then the measure of consumer services.

Thus far we have defined national income at the stage where it is acquired by, or accrues to, the consumers. This is probably the clearest way of presenting the meaning of national income. The total may, however, be measured at various stages in the productive process, and thus be presented from different viewpoints even though each gives identical totals.

NATIONAL INCOME

Table 1—NATIONAL INCOME IN THE UNITED STATES. AVERAGES PER YEAR

By Decades, 1869-1938

Decade	In prices of each year ¹			In prices of 1949 ²				
	National income (3) + (4)	Consumers' outlay (billions dollars)	Net savings	National income (6) + (7)	Consumers' outlay (billions dollars)	Net savings	National income ³

² Same source and tables with data in 1929 prices adjusted to 1949 prices by the relationship shown by the Consumers' Price Index in 1929 and 1949. Columns 6 and 7 may not add to column 5 exactly because of rounding.

³ Computed by the author

⁴ Data by years in current and 1929 prices may be found in the source cited in note 1 in Tables I 18, columns 1, 2 and 3 and in Table I 19, columns 1, 2 and 3.

First, at the stage of production, national income may be assessed as the net value of all commodities and services produced within the boundaries of a nation plus net income from foreign investment. Measurement may be made so as to give the amount of domestically produced income originating in each industry. That is, from the gross value of the product of each

industry adjusted for depreciation and inventory changes we subtract the purchases from other industries, to obtain the net value added by the particular industry. The sum of such net values for all industries gives the national income when adjusted for net income from foreign investment.

Second, the net values produced by each industry must be paid out, or accrued to, individuals as wages, interest, rent, and profits. The national income, viewed in terms of income payments, is, therefore, nothing but the sum of factor payments.

Data on national income for the United States have been extensively developed during the inter-war years (1919-1938) and are presented in Table 1 by overlapping decades from 1869 to 1938. The national income of the United States in constant dollars showed nearly an eight-fold increase in total and almost a tripling in amount per capita over the 69-year period. Year-to-year changes and cyclical movements are not apparent because of the decade averaging but the severity of the recession of 1929 is indicated by the decade averages for 1924-1933 and 1929-1938.

The period since 1938 experienced World War II and strict comparisons with the earlier period are problematical. Annual estimates of national income for the United States since 1938 are presented in Table 2. In the 14 years covered to 1953 the total national income in constant prices has more than doubled while the income per capita and per member of the labor force has increased by more than three-fourths. Although long comparisons have a less certain interpretation it is reasonably clear that the income of the United States, after correcting for price changes, has shown a phenomenal growth, approximating a 20-fold increase in total and nearly a six-fold increase per capita since the Civil War.

International comparisons are subject to the same difficulties as encountered in long-period national income comparisons and in addition must face the problem of converting all measures

Table 2—NATIONAL INCOME ESTIMATES FOR THE UNITED STATES, 1939-1953

Year	Total in prices of each year ¹	Total in 1949 prices ²	Per capita in 1949 prices ³	Per member of the labor force in 1949 prices ⁴
(1)	(2)	(3)	(4)	(5)
1939	72.5	124.4	950	2,237
1940	81.3	138.3	1,047	2,461

¹ Source: United Nations Statistical Office, *National and Per Capita Incomes in Seventy Countries*, 1949, New York, October, 1950. It must be emphasized, as the United Nations Statistical Office does, that these estimates are only very rough approximations. In the opinion of the author they significantly underestimate the incomes of the less industrialized countries.

into a single currency. The United Nations Statistical Office is trying to overcome these difficulties and the information in Table 3 provides a rough indication of the tremendous disparities which exist in income levels throughout the world. Irrespective of inaccuracies the differ-

ences are so wide as to leave little doubt that the nations of the world secure the material requisites of well-being for their inhabitants in very unequal amounts and that at least 80 per cent of the people of the world are below the poverty level.

NATIONAL INDUSTRIAL CONFERENCE BOARD, INC., an independent and nonprofit institution for scientific economic research whose purpose is "to study and encourage wider understanding of current economic problems."

The board's research, conference, publication and education programs are supported by several thousand subscribing associates, which include business organizations, labor unions, trade associations, libraries, government bureaus, individuals, colleges and universities.

The board, which is nonpolitical in character, conducts objective research in economics, business policies, and industrial relations. The results of these inquiries are issued through published reports, periodicals, press releases, and at meetings.

The board brings together business and labor executives in monthly conferences. In smaller technical sessions, experts appraise and discuss various timely subjects in the field of economics and personnel relations.

The board was founded in Boston in 1916 by Magnus W. Alexander and then included representatives of eleven major trade associations. Later, individual companies and other organizations were admitted. In 1936, the first labor union, Amalgamated Clothing Workers of America, was admitted and many large labor groups have since been associated with the board.

During World War I, the board was invited by the Council of National Defense to recommend policy on industrial relations. In the same year, the first cost of living study was issued by the board, and this series, the only nongovernment survey on a national scale, has since been maintained.

Upon Mr. Alexander's death in 1932, Dr. Virgil Jordan became the board's second president. He became chancellor of the board in 1949 and was succeeded by John S. Sinclair as president.

NATIONAL LABOR RELATIONS BOARD. On June 23, 1947, the 80th Congress, over presidential veto, passed into law the Labor Management Relations Act, popularly known as the Taft-Hartley law. The new statute greatly amended the National Labor Relations Act of 1935 (Wagner Act) and enlarged its scope of activities.

The new law reaffirms the right of employees to self-organization and to bargain collectively through representatives of their own choosing. Likewise, it retains the Wagner Act's unfair

labor practices provisions proscribing employer interference with and domination of employees' organizations, discrimination against employees because of union membership or other collective bargaining activities, and refusal to bargain collectively.

To these provisions Congress added a section in the new act embodying new unfair labor practices clauses which regulate union policies and activities. This section forbids unions to engage in the following types of conduct which it declares to be unfair labor practices:

- (1) To restrain or coerce employees in the exercise of their self-organizational rights;
- (2) To restrain or coerce an employer in the selection of his representatives for the purposes of collective bargaining or the adjustment of grievances;
- (3) To cause or attempt to cause an employer to discriminate against an employee on account of his membership or nonmembership in a labor organization, with the one exception of the authorized union shop;
- (4) To refuse to bargain collectively with an employer, provided the union is the majority-designated representative of the employees;
- (5) To encourage or engage in a strike in order to force an employer to assign work to members of a particular union or craft rather than to members of another union or craft;
- (6) To charge excessive or discriminatory initiation fees where an authorized union shop is in effect;
- (7) To cause or attempt to cause an employer to pay for work which is not to be performed; and
- (8) To encourage or engage in a strike or refusal to handle goods where an object of such activity is to: (a) require any employer or self-employed person to join a labor or employer organization; (b) require any employer to cease using, selling or transporting the products of any other employer, or to cease doing business with any other person; (c) require some other employer to bargain with a labor organization which has not been certified by the Board as the representative of that other employer's employees; and (d) require any employer to bargain with a labor organization where another labor organization has already been certified by the Board as the representative of his employees.

In addition, the new law separates the prosecuting from the judicial functions by vesting final authority for investigation and prosecution of all unfair labor practices cases in the General Counsel; enlarges the former board from three to five members; provides the board with injunctive powers; and adds four new type elections to be conducted by the board in addition to the Wagner Act collective bargaining polls:

- (1) The decertification election, to determine whether a certified or currently recognized labor organization still represents a majority of the employees;
- (2) The union-shop election, to determine whether the employees wish to authorize a union-shop agreement;
- (3) The de-authorizing election, to determine whether the employees wish to remove the labor organization's authority to enter into a union-shop agreement; and
- (4) The national emergency election, to determine whether employees wish to accept the final offer of settlement made by their employer. (This election must be conducted between the sixtieth and seventy-fifth days after a Federal District Court has issued an injunction against acts which imperil or threaten to imperil the national safety.)

In order to use the services of the board a labor organization is now required by the act to file annually a financial report and affidavits by each of its officers swearing that they are not Communists nor supporters of subversive movements. A labor organization which has failed to comply with the filing requirements may participate in only one type of election—an election to determine whether the employees wish to revoke the union's authority to represent them. A non-complying union is not entitled to any type of certification by the board.

The board has its headquarters in Washington, D.C., and maintains 24 regional offices and 8 subregional offices. The five board members

and the General Counsel are all appointed by the president.

NATIONAL MUSEUM. See UNITED STATES NATIONAL MUSEUM.

NATIONAL OLD TRAILS ROAD is a highway extending 3,096 miles, from Washington, D.C., to Los Angeles, Calif. Portions of its route follow that of the Cumberland Road and the Santa Fe Trail.

NATIONAL PARKS AND MONUMENTS. By act of Congress dated Aug. 25, 1916, The National Park Service was established as a bureau of the United States Department of the Interior to "promote and regulate the use of the federal areas known as national parks, monuments, and reservations . . . by such means and measures as conform to the fundamental purpose of said parks, monuments, and reservations, which purpose is to conserve the scenery and the natural and historic objects and the wild life therein and to provide for the enjoyment of the same in such manner and by such means as will leave them unimpaired for the enjoyment of future generations."

On June 30, 1954, there were 28 national parks, six national historical parks, 84 national monuments, 11 national military parks, three national battlefield parks, one national memorial park, five national battlefield sites, 10 national historic sites, 11 national memorials, 10 national cemeteries, four national parkways, and the system of National Capital Parks in, and adjacent to, the District of Columbia. Together they constitute a far-flung National Park System approximately 21,866,000 acres (federal land) in extent. In addition to administering these units of the National Park System, the National Park Service administers four recreation areas and one historic site (under cooperative agreements with other federal agencies). These five areas have a combined area of about 2,000,000 acres.

The National Park Service is host to millions of persons annually. During the 1953 calendar year alone the areas it administered attracted approximately 46,000,000 visitors who enjoyed drives over scenic roads; hiked or rode horseback over trails to points of interest and to sections otherwise inaccessible; fished in well-stocked streams and lakes; and "hunted" the native wildlife with a camera. Actual hunting in national parks and national monuments is prohibited, for these areas are maintained as game sanctuaries. Many persons inspected the areas and buildings of historical significance administered by the service, the majority of which are located in the East.

In most of the areas administered by the National Park Service, park ranger naturalists or historians guide interested persons on hikes or drives to points of special interest and conduct evening campfire programs, all designed to acquaint travelers with the rich scientific or historic backgrounds of the area they are visiting. Museums are also maintained for this purpose.

Overnight accommodations to fit every purse are available in most of the national parks and monuments, ranging from housekeeping cabins to luxurious hotels. Camping facilities are also available

All of the areas administered by the National

NATIONAL PARKS

Upper St. Mary Lake, one of the numerous crystal-clear lakes (notice the rocky lake bed, lower left) in Glacier National Park, Montana. The lake, originally believed by the Indians to be unfathomable, is at its deepest 200 feet. On the left, overshadowing the lake are Red Eagle (8,800 feet) and Little Chief (9,542 feet) mountains. The single pinnacle in the center is Mount Jackson (10,023 feet).

NATIONAL PARKS

Courtesy United States Department of the Interior

Beautiful Crater Lake in Crater Lake National Park, southwestern Oregon

Park Service, with the exception of a few areas located at high elevations and two national monuments (Yucca House, Colo., and Fossil Cycad, S. Dak., which are not open to the public at any time) are open throughout the year. During the winter months some national parks, particularly those in California, Oregon and Washington, are meccas for winter-sport enthusiasts.

Stephen T. Mather was the first director of the National Park Service and guided its activities until 1929. His successors in office have been Horace M. Albright, Arno B. Cammerer, Newton B. Drury, Arthur E. Demaray, and Conrad L. Wirth, the present incumbent.

In addition to a headquarters staff in Washington, D.C., the service has regional offices in Richmond, Va., Omaha, Nebr., Santa Fe, N. Mex., and San Francisco, Calif. It also has Eastern and Western Design and Construction Offices in Philadelphia, Pa., and San Francisco, Calif. The majority of the units in the national park system have resident superintendents.

Following is a list of the national parks, national historical parks, and national monuments administered by the National Park Service.

National Parks.—There are 28 areas in the United States and its territories which have been designated as National Parks. The list, with the date of establishment of each in parentheses, is as follows:

Acadia, Me. (1919), 30,363 acres. Rugged coastal area on Mount Desert Island, also picturesque Schoodic Peninsula on mainland, and half of Isle au Haut, exhibiting spectacular cliffs.

Big Bend, Texas (1944), 692,305 acres. Spectacular mountain and desert scenery; variety of unusual geological structures; enclosed in the great bend of the Rio Grande.

Bryce Canyon, Utah (1928), 36,010 acres. Amphitheaters filled with a countless array of fantastically eroded pinnacles of vivid coloring.

Carlsbad Caverns, N. Mex. (1930), 45,847 acres. Beautifully decorated limestone caverns, largest underground chambers yet discovered.

Crater Lake, Oreg. (1902), 160,290 acres. Vividly blue lake of exceptional depth and clearness in crater of extinct volcano.

Everglades, Fla. (1947), 1,258,591 acres. Portion of the only subtropical area in the United States; extensive watercourses, vast mangrove forests, and saw-grass prairies; abundant bird life.

Glacier, Mont. (1910), 999,262 acres. A region of picturesque peaks, gigantic precipices, and numerous lakes and glaciers. Forms part of the Waterton-Glacier International Peace Park established in 1932.

Grand Canyon, Ariz. (1919), 645,296 acres. Most spectacular part of the Colorado River's greatest canyon, which is 217 miles long.

Grand Teton, Wyo. (1929), 299,580 acres. Series of peaks comprising the most impressive part of the Teton Range; also portion of Jackson Hole.

Great Smoky Mountains, N. C.-Tenn. (1930), 507,168 acres. Includes portion of the Great Smokies, loftiest range east of the Black Hills, S. Dak.; luxuriant vegetation at lower elevations.

Hawaii, Territory of Hawaii (1916), 176,951 acres. Interesting volcanic areas on the islands of Hawaii and Maui.

Hot Springs, Ark. (1921), 1,019 acres. Contains 47 hot mineral springs used in treatment of certain ailments.

Isle Royale, Mich. (1940), 133,839 acres. Forested island, the largest in Lake Superior, distinguished for its wilderness character; great moose herd; pre-Columbian copper mines.

Kings Canyon, Calif. (1940), 453,655 acres. Mountain wilderness dominated by the two enormous canyons of the Kings River and by the summit peaks of the High Sierra. The former General Grant National Park, with its giant sequoias, is a detached section of the park.

Lassen Volcanic, Calif. (1916), 104,121 acres. Contains Lassen Peak, only recently active volcano in United States proper.

Mammoth Cave, Ky. (1936), 50,696 acres. Interesting caverns, including spectacular onyx cave formations and river 360 feet below surface.

Mesa Verde, Colo. (1906), 51,018 acres. Most no-

table and best preserved prehistoric cliff dwellings in the United States.

Mount McKinley, Alaska (1917), 1,939,319 acres. Main attraction is Mount McKinley, highest mountain in North America; large glaciers of the Alaska Range, abundant wildlife.

Mount Rainier, Wash. (1899), 241,571 acres. Includes Mount Rainier (14,408 feet), which bears a greater number of glaciers than any other peak in the United States proper.

Olympic, Wash. (1938), 888,182 acres. A true wilderness, with snow-capped peaks, mountain lakes, forests of unusual density, and bands of the rare Roosevelt elk.

Platt, Okla. (1906), 912 acres. Contains springs with distinctive mineral properties.

Rocky Mountain, Colo. (1915), 254,995 acres. Includes heart of the Rockies; 65 named peaks 10,000 to 11,250 feet high. Many glacial lakes.

Sequoia, Calif. (1890), 385,178 acres. Contains great groves of giant sequoias, world's largest and probably oldest living things; also Mount Whitney (14,495 feet), loftiest point in United States proper.

Shenandoah, Va. (1935), 193,173 acres. Includes outstanding portions of the Blue Ridge Mountains.

Wind Cave, S. Dak. (1903), 27,886 acres. Beautiful limestone caverns with peculiar boxwork formations.

Yellowstone, Wyoming, Montana, and Idaho (1872), 2,213,207 acres. Contains more geysers than in all the rest of the world together; hot springs, mud volcanoes, petrified forests, beautifully colored canyon, abundant wildlife.

Yosemite, Calif. (1890), 757,617 acres. Includes beautiful Yosemite Valley, spectacular waterfalls, High Sierra country, three groves of giant sequoias.

Zion, Utah (1919), 94,241 acres. Contains colorful Zion Canyon, an outstanding example of a deep, narrow, vertically walled chasm.

National Historical Parks.—There are seven such parks: Abraham Lincoln, Ky. (117 acres); Appomattox Court House, Va. (968); Chalmette, La. (70); Colonial, Va. (7,124); Cumberland Gap, Ky., Tenn., and Va. (20,100); Morristown, N. J. (958); Saratoga, N. Y. (2,208).

National Monuments.—In all there are 84 national monuments in the United States. These, with the date of establishment and the acreage in parentheses, are as follows:

Ackia Battleground, Miss. (1938; 49). Chickasaw Indian village site, and memorial of the Battle of Ackia in which the Chickasaws and British defeated the Choctaws and French, May 26, 1736.

Andrew Johnson, Tenn. (1942; 16): the president's home, tailor shop, and grave.

Arches, Utah (1929; 34,050): extraordinary examples of erosion.

Aztec Ruins, N. Mex. (1923; 27): ruins of 12th century Indian town.

Badlands, S. Dak. (1939; 103,548): eroded layers of sedimentary deposits, containing many prehistoric animal fossils.

Bandelier, N. Mex. (1916; 27,049): prehistoric Indian houses of the later Pueblo period.

Big Hole Battlefield, Mont. (1910; 200): site of battle during retreat of Chief Joseph and the Nez Percé Indians, 1877.

Black Canyon of the Gunnison, Colo. (1933; 13,176): deep, sheer sided canyon of geologic interest.

Cabrillo, Calif. (1913, 0.5): memorial to Juan Rodriguez Cabrillo, discoverer of San Diego Bay, 1542.

Canyon de Chelly, Ariz. (1931; 83,840): Indian ruins at the base of red cliffs, or in caves; modern Navajo farms.

Capitol Reef, Utah (1937; 33,971): long, colorful, buttressed sandstone cliff of Gothic appearance.

Capulin Mountain, N. Mex. (1916): huge cinder cone, a recently (geologically speaking) extinct volcano.

Casa Grande, Ariz. (1918; 473): prehistoric adobe tower built by Indians.

Castillo de San Marcos, Fla. (1924; 19): oldest masonry fort in the United States, started by Spanish, 1672.

Castle Clinton, N.Y. (1950; 1): built 1808-11, served successively as fort, entertainment center, and immigrant landing depot.

Castle Pinckney, S. C. (1924; 4): part of the early defenses of Charleston Harbor.

Cedar Breaks, Utah (1933; 6,172): great amphitheater eroded into the colorful Pink Cliffs.

Chaco Canyon, N. Mex. (1907; 20,989): 13 major Indian ruins, representing highest point of Pueblo civilization; hundreds of smaller ones.

Channel Islands, Calif. (1938; 26,819): large rookery of sea lions; unique plants and animals. Includes Santa Barbara and Anacapa Islands.

- Chiricahua, Ariz. (1924; 10,481): unusual rock shapes.
- Colorado, Colo. (1911; 17,596): eroded sandstone.
- Craters of the Moon, Idaho (1924; 48,004): volcanic cones, craters, lava flows and other volcanic phenomena.
- Custer Battlefield, Mont. (1946; 765): site of the Battle of the Little Bighorn River, June 25, 1876.
- Death Valley, Calif.-Nev. (1933; 1,864,898): vast desert, weird formations, salt and borax beds; includes the lowest point in the Western Hemisphere, 282 feet below sea level.
- Devils Postpile, Calif. (1911; 798): symmetrical blue-gray columns rising to 60 feet, an old basaltic lava flow.
- Devils Tower, Wyo. (1906; 1,194): tower of columnar rocks rising 865 feet; the first national monument.
- Dinosaur, Utah-Colo. (1915; 190,962): spectacular canyons; fossil quarry.
- Effigy Mounds, Iowa (1949; 1,204): Indian mounds in shapes of birds and animals.
- El Morro, N. Mex. (1906; 881): Inscription Rock of soft sandstone, in which are many old carvings, including inscriptions of early Spanish explorers.
- Fort Frederica, Ga. (1945; 94): built by Gen. James Oglethorpe in 1736-48.
- Fort Jefferson, Fla. (1935; 47,125): fort built 1846, a military prison; bird refuge.
- Fort Laramie, Wyo. (1938; 214): old Oregon Trail fort.
- Fort Matanzas, Fla. (1924; 228): Spanish fort, 1737.
- Fort McHenry, Md. (1939; 43): fort whose defense in 1814 inspired the writing of *The Star-Spangled Banner*.
- Fort Pulaski, Ga. (1924; 5,362): early 19th-century fort.
- Fort Sumter, S. C. (1948; 2): site of start of Civil War.
- Fort Vancouver, Wash. (1954; 60): site of fur-trade headquarters and military outpost which figured in development of the Pacific Northwest.
- Fossil Cycad, S. Dak. (1922; 320): fossils of fernlike plants of the Mesozoic period.
- George Washington Birthplace, Va. (1930; 394): house and gardens on site of Washington's birthplace.
- George Washington Carver, Mo. (1951; 210): site of birthplace and home of the famous Negro scientist.
- Gila Cliff Dwellings, N. Mex. (1907; 160): well-preserved cliff dwellings in natural cavities; 150 feet high.
- Glacier Bay, Alaska (1925; 2,297,734): tidewater glaciers.
- Gran Quivira, N. Mex. (1909; 451): 17th-century Spanish mission, mission buildings, and Indian pueblo house mounds.
- Grand Canyon, Ariz. (1932; 196,051): part of the famous, many-colored canyon.
- Great Sand Dunes, Colo. (1932; 35,522): shifting dunes.
- Homestead, Nebr. (1939; 163): site of the first claim under the Homestead Act of 1862.
- Hovenweep, Utah-Colo. (1923; 491): prehistoric towers, pueblos, and dwellings.
- Jewel Cave, S. Dak. (1908; 1,275): limestone caverns.
- Joshua Tree, Calif. (1936; 476,153): desert flora.
- Katmai, Alaska (1918; 2,697,590): dying volcanic region, including the Valley of Ten Thousand Smokes.
- Lava Beds, Calif. (1918; 46,239): principal theater of Modoc Indian War, 1873; volcanic phenomena.
- Lehman Caves, Nev. (1922; 640): limestone caves.
- Meriwether Lewis, Tenn. (1925; 300): burial place of Lewis, on the Natchez Trace.
- Montezuma Castle, Ariz. (1906; 783): cliff dwellings.
- Mound City Group, Ohio (1923; 68): Indian mounds.
- Muir Woods, Calif. (1908; 485): stand of coast red-woods.
- Natural Bridges, Utah (1908; 2,650): 3 natural sandstone bridges; highest 222 feet above stream bed, span 261 feet.
- Navajo, Ariz. (1909; 360): three famous cliff dwellings.
- Ocmulgee, Ga. (1936; 683): mounds and prehistoric remains.
- Old Kasaan, Alaska (1916; 38): site of an abandoned Haida Indian village.
- Oregon Caves, Oreg. (1909; 480): limestone caves.
- Organ Pipe Cactus, Ariz. (1937; 328,162): traces of the Camino del Diablo, old Spanish route; unique desert plants.
- Perry's Victory and International Peace Memorial, Ohio (1936; 14): site at Put In Bay, scene of Commodore Oliver Perry's victory, 1813; commemorates a century of peace between Canada and the United States.
- Petrified Forest, Ariz. (1906; 85,304): display of petrified wood; Indian ruins; part of the Painted Desert.
- Pinnacles, Calif. (1908; 12,818): spirelike rock formations 500-1,200 feet high, and other volcanic phenomena.
- Pipe Spring, Ariz. (1923; 40): historic Mormon fort.
- Pipestone, Minn. (1937; 116): quarry used by Indians to obtain material for making ceremonial peace pipes.
- Rainbow Bridge, Utah (1910; 160): salmon-pink sandstone natural bridge, arching 309 feet above the gorge bottom.
- Saguaro, Ariz. (1933; 54,972): cactus forest.
- Scotts Bluff, Nebr. (1919; 2,196): Oregon Trail landmark.
- Sitka, Alaska (1910; 54): site of Indian stockade where Indians made their last stand against Russian settlers; totem poles.
- Statue of Liberty, N.Y. (1924; 10): huge copper statue on Bedloe's Island in New York Harbor; universal symbol of freedom and democracy.
- Sunset Crater, Ariz. (1930; 3,040): volcanic cone, highly colored on the upper part; lava flows.
- Timpanogos Cave, Utah (1922; 250): limestone cave.
- Tonto, Ariz. (1907; 1,120): 14th-century cliff dwellings.
- Tumacacori, Ariz. (1908; 10): historic Spanish mission.
- Tuzigoot, Ariz. (1939; 43): excavated ruins of a pueblo which flourished between 1000 and 1400 A.D.
- Verendrye, N. Dak. (1917; 253): memorial to the Verendrye explorations of the early 18th century.
- Walnut Canyon, Ariz. (1915; 1,642): cliff dwellings in caves under ledges of limestone.
- White Sands, N. Mex. (1933; 140,247): white gypsum dunes.
- Whitman, Wash. (1940; 46): Oregon Trail landmark; site where Dr. and Mrs. Marcus Whitman ministered to Indians.
- Wupatki, Ariz. (1924; 34,733): prehistoric pueblos of red sandstone.
- Yucca House, Colo. (1919; 10): unexcavated ruins of prehistoric Indian pueblo.
- Zion, Utah (1937; 33,921): colorful Kolob Canyon and Hurricane Fault, examples of geologic phenomena.

CONRAD L. WIRTH,

Director, National Park Service, United States Department of the Interior.

NATIONAL PORTRAIT GALLERY,

The, in London, England, was originated by Philip Dormer Stanhope, 5th Earl Stanhope, an eminent historian. He made public the idea before the House of Commons in 1845. On Dec. 2, 1856, a board of trustees was appointed by the lords commissioners of Queen Victoria's Treasury, and money was given to it. The gallery was first opened at 29 Great George Street and in 1889 was moved to the present location, near Trafalgar Square. The purpose of the exhibition is to have an outstanding collection of portraits of the famous people of the British Empire. In 1932, the gallery contained 3,800 individual portraits. An extension was opened in 1933. The entire collection was stored during World War II but the gallery reopened in July 1945. See also NATIONAL GALLERY.

NATIONAL RECOVERY ADMINISTRATION (NRA), a former federal agency which was set up under the National Industrial Recovery Act, approved June 16, 1933, and which was dissolved by order of the president on Jan. 1, 1936, after the United States Supreme Court on May 27, 1935, in an unanimous decision, had declared Section 3 of Title I of the act, its most important provision, unconstitutional.

The National Industrial Recovery Act and its companion measure, the original Agricultural Adjustment Act (declared unconstitutional by the Supreme Court, Jan. 6, 1936), were the two most important legislative measures enacted during the early days of the Roosevelt (New Deal) administration for the purpose of combatting the economic depression which began in the fall of 1929, and in 1933 was at about its worst. The National Industrial Recovery Act was designed to relieve industrial unemployment (then very widespread) by shortening hours of labor, increasing wages, and eliminating unfair trade practices as well as destructive price-cutting through the enforcement of such codes of fair competition as might be adopted under Section 3 of Title I of the act and approved by the

president. The code-making authority was the vital feature of the act, and when the Supreme Court ruled that the making of codes was a legislative function which Congress could not delegate, even to the president, it cut the heart out of the law. Thereafter there was little reason for keeping the NRA alive, and it was kept alive only long enough to correlate and summarize such information as it had collected and could collect with respect to the effect on industry of code administration and the discontinuance thereof.

Immediately after approving the Industrial Recovery Act, President Roosevelt appointed Brig. Gen. Hugh S. Johnson, who had resigned from the army in 1919, to administer the provisions of Title I. He at once embarked upon the task of establishing codes of fair competition. By Jan. 1, 1935 it was stated that approximately 98 per cent of all American industry represented by 541 codes and 177 supplementary codes was operating under the industrial self-government program contemplated by the Recovery Act. Other accomplishments, according to a report, included: (1) The elimination of child labor and the curtailment of industrial housework; (2) the establishment of the principle of a limited work week and minimum rates of pay; (3) the decrease of industrial unemployment; and (4) the curtailment of wage-cutting in price competition.

General Johnson resigned as administrator Sept. 24, 1934, and three days later President Roosevelt, by executive order, created the National Industrial Recovery Board to carry on the work begun by General Johnson, and vested it with all of the powers which had been conferred upon him. Following the Supreme Court's decision, the president, on June 14, 1935, approved a joint resolution of Congress extending the provisions of Title I of the act, in greatly modified form, to April 1, 1936. The following day the National Industrial Recovery Board was abolished by an executive order which re-created the Office of Administrator, abolished when General Johnson resigned. Under the new regime, James L. O'Neill was appointed acting administrator, an assistant to the administrator to represent labor was created, an Advisory Council was set up, and a Division of Review and a Division of Business Co-operation were created. The executive order decreeing the dissolution of the NRA on Jan. 1, 1936, was issued by the president on Dec. 23, 1935. The same order abolished the Office of Administrator and transferred to the Department of Commerce the Advisory Council and the divisions of Review and of Business Co-operation to function therein until April 1, 1936.

While General Johnson was at the helm, NRA was front page news almost daily. He was a picturesque character with a remarkable flair for the dramatic. Throughout the country he made speeches threatening to "crack down" on those industrialists who balked at going his way. He adopted the "Blue Eagle" as NRA's emblem; insisted that it be used as a mark of identification on all goods manufactured under code provisions, and that all householders display replicas of it in their windows as evidence of their loyalty to the country and as a guarantee that they would purchase only products bearing the insignia. Among the public there was much criticism of the codes. Some contended that their effect was to give an undue advantage to big business; that they abolished competition; and that they were formulated by and for the bene-

fit of the leaders in the respective industries without regard to the rights of small industrialists. No one accused General Johnson of undue partiality toward big business. His job was to see that the various industries adopted codes, while for the most part the codes were written by the industries themselves. The general impression now is that the NRA attempted entirely too much. It insisted upon the codification of all industries, big and little, even adopting codes for barbers and pants pressers, which, like some of the other codes, increased prices without improving workmanship or quality.

NRA

Decision.—Two principal questions were involved in the case which resulted in the final dissolution of the NRA. One was whether Congress had the right to delegate its legislative power, and the other was whether Congress had the power to fix the hours and wages of employees engaged in the internal commerce of a state because such wages and hours may have an indirect effect on interstate commerce. The answer of the Supreme Court to both questions was an emphatic "No." The facts in the case were briefly these: the A. L. A. Schecter Poultry Corporation and the Schecter Live Poultry Market; Joseph Schecter, operator of the latter and financial backer of the former; and Martin, Alex and Aaron Schecter, operators of the Poultry Corporation, conducted a wholesale poultry business in Brooklyn, N. Y., and had been convicted in a Federal District Court of violating in numerous ways the Live Poultry Code which had been promulgated under Section 3 of the National Industrial Recovery Act. Before the Supreme Court, to which the case was taken on appeal, attorneys for the government insisted that the provisions of the act authorizing the adoption of codes should be viewed in the light of the "grave national crisis with which Congress was confronted" when the law was enacted. To this contention the Supreme Court, in an opinion by Chief Justice Hughes, said:

"Extraordinary conditions may call for extraordinary remedies. . . . Extraordinary conditions do not create or enlarge constitutional power. . . . Section 3 of the Recovery Act is without precedent. It supplies no standards for any trade, industry or activity. It does not undertake to prescribe rules of conduct to be applied to particular states of fact determined by appropriate administrative procedure. Instead of prescribing rules of conduct, it authorizes the making of codes to prescribe them. For that legislative undertaking Section 3 sets up no standards, aside from the statement of the general aims of rehabilitation, correction, and expansion described in Section 1. In view of the scope of that broad declaration, and of the nature of the few restrictions that are imposed, the discretion of the President in approving or prescribing codes, and thus enacting laws for the government of trade and industry throughout the country, is virtually unfettered. We think the code-making authority thus conferred is an unconstitutional delegation of legislative power. Congress cannot delegate legislative power."

With respect to the right of the government to fix the wages and hours of labor, the court said: "We are of the opinion that the attempt through provisions of the code to fix the hours and wages of employes of the defendants in their

intrastate business was not a valid exercise of Federal Power. . . . On both the grounds we have discussed, the attempted delegation of legislative power, and the attempted regulation of intrastate transactions which affect interstate commerce only indirectly, we hold the code provisions here in question to be invalid, and that the judgment of conviction must be reversed."

NATIONAL RESEARCH COUNCIL.

A scientific body in the United States, organized, at the request of President Wilson in 1916, by the National Academy of Sciences under its congressional charter for the purposes of promoting research in the natural sciences and encouraging the application and dissemination of scientific knowledge. As the principal operating agency of the academy, the council fosters research projects and furnishes professional advice to governmental and private organizations; it also administers funds entrusted to it for research and fellowship programs.

The membership is composed of representatives of nearly 100 scientific and technical societies, research institutions, or government agencies; and also of members-at-large appointed by the council. There are about 225 members. In addition to its general committees, the council has eight divisions: international relations; mathematical and physical sciences, including astronomy; engineering and industrial research; chemistry and chemical technology; geology and geography; medical sciences; biology and agriculture; and anthropology and psychology.

The work of the council is carried on largely through its approximately 400 committees, boards, and panels, which have as members more than 2,000 distinguished scientists. The council does not maintain its own scientific laboratories; its chief concern is the cooperation and integration of research activities.

The council receives no government appropriation. The administrative expenses are defrayed by the income from a permanent endowment established from a gift of the Carnegie Corporation of New York, a portion of which was used to erect the Academy-Council Building in Washington, D.C. Financial support of scientific projects and fellowships is obtained from contracts with governmental or private agencies and from special grants from foundations, societies, and individuals. This support amounts to about \$3,000,000 annually. Almost half of this sum goes to support the advanced study of more than 400 fellows appointed under the 15 predoctoral and postdoctoral fellowship programs which the council administers for various organizations.

The publications of the National Research Council are: *Bulletins* consisting mainly of monographic reports on the work of council committees; *Reprint and Circular Series*, shorter papers of current scientific interest; *Highway Research Abstracts*; *Mathematical Tables and Other Aids to Computation*; *Prevention of Deterioration Abstracts*; and numerous miscellaneous reports, bulletins, and bibliographies.

RAYMUND L. ZWEMER,
Executive Secretary, National Research Council.

NATIONAL RETAIL DRY GOODS ASSOCIATION (NRDGA), a retail trade group with a membership of more than 7,000 retail stores located in every state in the United

States, in Canada, and in 10 foreign countries, is incorporated under the laws of the State of New York. Its board of directors is chosen from the executives of member stores, and its purpose is to aid in developing increased efficiency in every phase of retail operating procedures.

It is a nonprofit, voluntary membership organization, with administrative headquarters in its own New York, N. Y., office building, and with branch offices in Washington, D.C., and in San Francisco, Calif.

The NRDGA is regarded as one of the leading trade associations in the world, functioning in all areas in which the interests of the retail trade are at stake. Its actions are particularly directed to matters which, except for association action, individual stores could not accomplish alone, or could not do so as economically as their association.

The NRDGA is subdivided into ten major groups and divisions, each staffed by experts in their particular field of retailing and each functioning under the supervision of its own board of directors, consisting of member-store executives in their special field of retail activity. These groups and divisions are:

- The Controllers' Congress
- The Merchandising Division
- The Store Management Group
- The Personnel Group
- The Sales Promotion Division
- The Credit Management Division
- The Traffic Group
- The Delivery Group
- The Ready-to-Wear Group
- The Smaller Stores Division

The association has back of it more than 40 years of experience and exhaustive research, upon which it draws to provide for member stores technical assistance and advice on every phase of retailing, and store operating problems.

One important aspect of NRDGA activity consists of the interesting and mutually helpful ideas on retailing exchanged by merchants who attend the association's yearly meetings of its groups and divisions and its annual convention. The value of such exchanges of information is evidenced by the fact that more than 20,000 store executives gather each year for these sessions.

NRDGA activities—its policies and functions—are entirely governed by the vote of member stores.

NATIONAL SAFETY COUNCIL. This noncommercial, nonprofit association, hub of the safety movement in the United States, was established in 1913. The membership, totaling about 7,500, includes industrial and transportation members employing more than 9,000,000 persons, service or professional organizations which may control or influence safety work in hundreds of branches or units, and community or state safety organizations which carry on extensive programs of safety in their territories. There is a staff of 275 persons at the headquarters office in Chicago. Regional offices are maintained in New York and San Francisco. Approximately 1,000 men and women serve without pay as council officers and committeemen. The work of the National Safety Council is financed largely through membership dues.

The principal activities are of three sorts:

1. **Printed Material.**—Published material is of three kinds: (a) nine monthly magazines, reviewing current happenings in every kind of

safety work; (b) several hundred technical pamphlets and memos, providing standard information on safe equipment and safe methods; (c) a constant flow of inspirational and interest-maintaining safety material, such as posters, newspaper publicity, radio releases, newsletters, and calendars.

2. Conventions and Conferences.—An annual, five-day, national convention is held, with an average attendance of 12,000 persons and comprising 125 sessions. Help is also given in the organizing of numerous regional safety conferences.

3. Field Service.—States and cities are given assistance in forming safety organizations, in improving traffic control measures, and in related problems. Some 75 community and state safety organizations are affiliated with the National Safety Council.

R. L. FORNEY,

General Secretary, National Safety Council.

NATIONAL SCIENCE FOUNDATION, The, is a federal agency, established by Congress in 1950 "to promote the progress of science; to advance the national health, prosperity and welfare; to secure the national defense; and for other purposes."

The foundation has the responsibility of developing and encouraging the pursuit of a national policy for the promotion of basic research and education in the sciences; for initiating and supporting basic scientific research in the mathematical, physical, medical, biological, engineering, and other sciences, and for appraising the impact of research upon industrial development and upon the national welfare.

In carrying out these broad objectives, the foundation supports research and education through grants and fellowships, fosters the exchange of scientific information among scientists in the United States and foreign countries, and surveys the nature and extent of scientific research and development activities in the United States. In view of the magnitude of the over-all federal research and development program, which in the mid-1950's was more than two billion dollars, an especially important function of the foundation is the study of the federal program in support of scientific research, the role of the federal government in support of science, and the correlation of the foundation's scientific research program with those of other groups, both private and public. With the cooperation and participation of the scientific societies of America, the foundation maintains a register of scientific and technical personnel and provides a central clearinghouse of information covering scientific and technical personnel in the United States.

Organizationally, the foundation consists of the 24-member National Science Board, chosen by the president of the United States from among persons eminent in the fields of the basic sciences, medical science, engineering, agriculture, education, and public affairs; and a director chosen by the president to serve for a term of six years. The principal operating divisions are: Biological and Medical Research; Mathematical, Physical, and Engineering Sciences; and Scientific Personnel and Education, which is concerned with the award of scholarships and graduate fellowships and problems relating to education in the sciences.

LEE ANNA EMBREY.

NATIONAL SECURITY ORGANIZATION. The National Security Act of 1947 including the 1949 Amendments and Reorganization Plans 3 and 6 of 1953 forms the basis for the National Security Organization within the United States. The legislation provides for the determination of integrated policies and procedures for the departments, agencies, and functions of the federal government having to do with national security. It establishes three separately administered military departments: the Army, the Navy, and the Air Force, and provides for the coordination and unified direction of the military departments under the civilian control of the Secretary of Defense.

History and Nature of National Security Act.—The movement which finally led to the passage of this act originated shortly after World War I with certain proponents of air power who believed that greater autonomy and importance should be given to the United States Army Air Force. It was argued that this could best be brought about by a merger of the War and Navy Departments, with all air activities segregated in a single division of the merged departments. The proposed arrangement was not adopted because it would have deprived the Navy of essential control over its aviation activities. The early plans also contemplated absorption of the Marine Corps by the Army.

Drawing upon World War II experience, and the demonstrated value of certain inter-service procedures, the law, as passed on July 26, 1947, did not merge the armed services but set up a separate Air Force and attempted an integration of all of the forces and resources needed for waging modern warfare. Civilian control over the military forces was retained in accordance with the political philosophy of the Constitution of the United States, expressed in making the President Commander in Chief of the Army and Navy. James Forrestal became the first Secretary of Defense on Sept. 17, 1947.

Following recommendations made by the Hoover Commission, the National Security Act was amended in 1949. The military establishment became one executive department, the Department of Defense, and the former executive departments of the Army, the Navy, and the Air Force were designated as military departments, but the Secretaries of these three Departments ceased to have cabinet rank. The position of Chairman of the Joint Chiefs of Staff, which had existed informally since World War II, was made statutory.

Another reorganization of the National Security Organization took place in 1953 (Reorganization Plans 3 and 6) based on the report of the Rockefeller Committee. The National Security Resources Board, the Munitions Board, and the Research and Development Board were abolished; at the same time an Office of Defense Mobilization was formed and appointment of additional Assistant Secretaries of Defense were authorized.

The National Security Act is organized under four titles; Title I—Coordination for National Security; Title II—The Department of Defense; Title III—Miscellaneous provisions having to do with salaries of personnel, definitions, funds, and other such matters; Title IV—Promotion of Economy and Efficiency Through Establishment of Uniform Budgetary and Fiscal Procedures and Organizations.

TITLE I: COORDINATION FOR NATIONAL SECURITY

By this title, three activities are created: a National Security Council which recognizes the need for close and continued coordination on a high level within the federal government of the domestic, military, and foreign policies of the country; a Central Intelligence Agency which correlates, evaluates, and disseminates intelligence having a bearing on national security; and an Office of Defense Mobilization for improved and systematized planning in regard to the control and use, in the event of an emergency, of the country's manpower, natural resources, and industrial facilities.

National Security Council.—The function of the council is to advise the president with respect to the integration of the nation's domestic, foreign, and military policies, so as to enable the armed services and other departments of the government to discharge effectively their responsibilities with respect to national security. Specifically, it is the duty of the council to assess and appraise the objectives, commitments, and risks of the United States in relation to the country's actual and potential military power.

The council is composed of the president, who presides at its meetings; the vice president; the secretary of State; the secretary of Defense; the director of the Office of Defense Mobilization; and the director of the Foreign Operations Administration, as permanent members. Secretaries and under secretaries of other executive departments and the military departments may be appointed to the council by the president. No military officers are members of the council although they may be called on for advice and recommendation on any subject under consideration by the Council.

Central Intelligence Agency.—This agency is established under the National Security Council and makes its reports and recommendations to the council. The duties of the agency are to coordinate in the interest of national security the intelligence activities of the several government departments with a view to avoiding duplication of effort and working at cross purposes; with correlating and evaluating intelligence gathered by the intelligence activities of the several government departments and agencies; and with disseminating such intelligence within the government, using existing agencies and facilities where appropriate.

Office of Defense Mobilization.—This office took the place of the National Security Resources Board and was created by Reorganization Plan No. 3 of 1953 to advise and assist the president concerning the coordination of military, industrial, and civilian mobilization for the national defense, including policies and programs for vital material stockpiling, manpower, and production.

TITLE II: THE DEPARTMENT OF DEFENSE

The Department of Defense is an executive department of the government headed by a secretary of Defense who is the principal assistant to the president on all matters relating to the department. Within the Department of Defense are the three military departments of the Army, the Navy, and the Air Force.

Secretary of Defense.—The secretary of Defense is appointed from civilian life by the president with the consent of the Senate. He

exercises direction, control, and authority over the Department of Defense. The secretary is assisted by a deputy secretary of Defense who coordinates the activities of the Department of Defense as directed by the secretary, and who exercises the powers of the secretary during his absence or disability. There are nine assistant secretaries of Defense with specific duties prescribed by the secretary as follows: comptroller; manpower and personnel; legislative and public affairs; international security; research and development; supply and logistics; properties and installations; health and medical; military applications engineering. Provision is also made for a general counsel, with the rank of assistant secretary, to act as chief legal adviser of the Department of Defense.

Officers of the armed services may be detailed to duty as assistants and personal aides to the secretary of Defense, but he is specifically enjoined from establishing a military staff.

The Armed Services.—The military departments of the Army, the Navy, and Air Force replaced the former executive departments of War and Navy. Each military department is separately administered by its civilian secretary under the direction, authority, and control of the secretary of Defense. Each has an under secretary and several assistant secretaries.

Department of the Army.—The term is construed by the act to mean the Department of the Army at the seat of government and all field headquarters, forces, reserve components, installations, activities, and functions under the control and supervision of this department. The head of the department has the title secretary of the Army. The United States Army, within the Department of the Army, includes land combat and service forces, and such aviation and water transportation as may be organic therein. The army is to be organized, trained, and equipped primarily for prompt and sustained combat incident to operations on land.

Department of the Navy.—No change was made in the name of this department, nor in the title of the secretary of the Navy. The term is construed by the act to mean the Department of the Navy at the seat of government; the headquarters, United States Marine Corps; the entire operating forces of the United States Navy, including naval aviation, and of the United States Marine Corps; all field activities, headquarters, forces, bases, installations, activities, and functions under the control and supervision of the Department of the Navy; and of the United States Coast Guard when it operates as part of the Navy in time of war. Naval aviation is integrated with the naval service within the Department of the Navy.

The act stipulates that the United States Navy is to be organized, trained, and equipped primarily for prompt and sustained combat incident to operations at sea, and that it shall be generally responsible for naval reconnaissance, anti-submarine warfare, and the protection of shipping.

In order to leave no question as to the status of the United States Marine Corps, the act stipulates that the Marine Corps shall be organized, trained, and equipped to provide fleet marine forces, together with supporting air components, for service with the fleet in the seizure or defense of advanced naval bases and for the conduct of such land operations as may be essential to the prosecution of a naval campaign.

Department of the Air Force.—This newest of the military departments is headed by the secretary of the Air Force. The term is construed to mean the Department of the Air Force at the seat of government and all field headquarters, forces, reserve components, installations, activities, and functions under the control of the Air Force. The Air Force is to be organized, trained and equipped primarily for prompt and sustained offensive and defensive air operations, and shall be responsible for the preparation of the air forces necessary for the effective prosecution of war except as otherwise assigned.

Armed Forces Policy Council.—The council was formed to advise the secretary of Defense on matters of broad policy relating to the armed forces. Membership of the council consists of the secretary of Defense, chairman; deputy secretary of Defense; secretary of the Army; secretary of the Navy; secretary of the Air Force; chairman of the Joint Chiefs of Staff; chief of Staff, United States Army; chief of Naval Operations; chief of Staff, United States Air Force; and commandant, United States Marine Corps (only on Marine Corps matters).

Joint Chiefs of Staff.—The Joint Chiefs of Staff comprising a chairman, without voting rights; the chief of Staff, United States Army; chief of Naval Operations; and the chief of Staff, United States Air Force; plus the commandant of the Marine Corps when any matter under consideration directly concerns the Marine Corps, are the principal military advisers to the president, the National Security Council, and the secretary of Defense. The principal duties of the Joint Chiefs of Staff are: (1) to prepare strategic plans and to provide for the strategic direction of the military forces, including the unification, where appropriate, of commands in strategic areas; (2) to review major material and personnel requirements of the military forces, and to prepare joint logistic plans and responsibilities in accordance therewith; (3) to formulate policies for the education and training of the military forces, and (4) to provide United States representation on the military staff committee of the United Nations.

Joint Staff.—The Joint Chiefs of Staff are authorized to have a staff of not more than 210 officers composed of approximately an equal number from each of the three armed services.

WILLIAM J. MORGAN,

Division of Naval History, United States Navy Department.

NATIONAL SECURITY RESOURCES BOARD, an agency of the federal government, established by the National Security Act of 1947 (Public Law 253, 80th Congress, 1st Session, July 26, 1947). Its functions are set forth in Title I, Section 103, of that act, as follows:

(a) There is hereby established a National Security Resources Board (hereinafter in this section referred to as the "Board") to be composed of the Chairman of the Board and such heads or representatives of the various executive departments and independent agencies as may from time to time be designated by the President to be members of the Board. The Chairman of the Board shall be appointed from civilian life by the President, by and with the advice and consent of the Senate.

(b) The Chairman of the Board, subject to the direction of the President, is authorized, subject to the civil-service laws and the Classification Act of 1923, as amended, to appoint and fix the compensation of such personnel as may be necessary to assist the Board in carrying out its functions.

(c) It shall be the function of the Board to advise the President concerning the coordination of military, industrial, and civilian mobilization, including: (1) policies concerning industrial and civilian mobilization in order to assure the most effective mobilization and maximum utilization of the Nation's manpower in the event of war; (2) programs for the effective use in time of war of the Nation's natural and industrial resources for military and civilian needs, for the maintenance and stabilization of the civilian economy in time of war, and for the adjustment of such economy to war needs and conditions; (3) policies for unifying, in time of war, the activities of Federal agencies and departments engaged in or concerned with production, procurement, distribution, or transportation of military or civilian supplies, materials, and products; (4) the relationship between potential supplies of, and potential requirements for, manpower, resources, and productive facilities in time of war; (5) policies for establishing adequate reserves of strategic and critical material, and for the conservation of these reserves; (6) the strategic relocation of industries, services, government, and economic activities, the continuous operation of which is essential to the Nation's security.

(d) In performing its functions, the Board shall utilize to the maximum extent the facilities and resources of the departments and agencies of the Government.

The board also has continuing statutory functions in connection with the disposal of government-owned rubber producing facilities under the Rubber Act of 1948, in connection with the mandatory authority for the procurement of articles, or materials needed for the armed forces or the Atomic Energy Commission under the Selective Service Act of 1948, and in connection with the need for improved highways for the national defense under the Federal-Aid Highway Act of 1948. Moreover, the chairman of the board is a statutory member of the National Security Council, and a member of the Defense Mobilization Board (Executive Order 10200, Jan. 3, 1951).

Following the establishment of the board in 1947, the president designated as its membership the chairman of the National Security Resources Board, the secretary of the treasury, the secretary of defense, the secretary of the interior, the secretary of agriculture, the secretary of commerce, and the secretary of labor. The secretary of state was added to the board's membership on Feb. 19, 1948.

Arthur Middleton Hill served as first chairman of the NSRB from Aug. 29, 1947, to Dec. 15, 1948. On Dec. 16, 1948, Dr. John R. Steelman succeeded him, as acting chairman, until April 26, 1950, when W. Stuart Symington, first secretary of the air force, took the oath of office as chairman, a post in which he served until May 4, 1951. The president then named as acting chairman Jack O. Gorrie who had served as the executive assistant to both Dr. Steelman and Mr. Symington.

During the years of its existence, the board, in cooperation with other agencies of the federal government, with the state governments, and representatives of industry, labor, and agriculture, has made a variety of studies on the nation's resources, prepared draft emergency legislation, laid the foundations for the establishment of the emergency defense agencies, participated in the work of the National Security Council, and advised the president on alternative mobilization plans and national security "readiness measures" involving the nation's human and material resources in the event of war.

In addition to its statutory functions, the board has exercised other responsibilities relating to the national security, executive orders, and other presidential directives.

To assist the president to coordinate emergency defense production activities under the Defense Production Act of 1950, the chairman of the

NSRB was directed by Executive Order 1016, Sept. 9, 1950, to resolve interagency issues, prescribe approved policy and program objective, and advise the president on the progress of the defense production program.

While the board's mobilization planning proved useful in the nation's partial mobilization precipitated by the North Korean aggression in 1950, the board continues its primary concern with broad national policy which affects the nation's resources potential in the event of all-out war.

NATIONAL SOCIALIST (NAZI) PARTY. The National Socialist movement in Germany grew out of the economic dislocation, humiliations, and frustrations of the German people after defeat in World War I and the imposition of the Versailles Treaty. Loss of territories, abatement of military prestige, reparation burdens, and monetary inflation with resultant destruction of the independent middle class, created psychological conditions favoring acceptance of Nazi theories. These included repudiation of war guilt, assertion that the war had not been lost on the battlefield but on the home front by the treachery of non-German elements (particularly the Jews), contempt for democratic procedures, the need of a leader to raise Germany to her rightful place of world dominance, and the subordination of the individual to the state. The Nazi Party originated in the mildly radical German Workers' Party, founded in 1918, which Adolf Hitler and his friends renamed National Socialist German Labor Party (*Nationalsozialistische Deutsche Arbeiterpartei*). At a party congress held in 1920 Hitler announced a 25-point program including both radical and conservative features. It won him the support of all important elements of the population, including the military, white-collar, and industrialist classes. The party dissolved on Germany's defeat in 1945. See also **HITLER, ADOLF**; **GERMANY—History**.

NATIONAL SOCIETY OF COLONIAL DAMES OF AMERICA. The. An ancestral and patriotic organization of American women, founded May 19, 1892, and composed of one Colonial Society from each of the 13 original states, one society from the District of Columbia, and one associate society from each of the 27 noncolonial states. To be eligible for membership, a woman must be descended from some worthy ancestor who rendered valuable service to the colonies and who became a resident of America previous to 1750. Membership is by invitation only. The membership in 1954 was about 13,200. The objects of the society are: to preserve colonial history, traditions, manuscripts, records, relics, and buildings, to perpetuate the brave deeds and glorious memory of the colonists, and to encourage patriotism.

Churches and colonial houses of historical importance have been restored, historical sites marked, and prizes awarded for essays on patriotic subjects to pupils of schools and colleges. Forty-four historical museums are maintained by 27 state societies.

Indian nurses have been trained by scholarships and returned to work among their own people.

Large sums of money were raised for relief during the Spanish-American War. In World War I over \$100,000 was supplied to hospital ships

in the United States Navy. In World War II many ambulances were purchased, Red Cross rooms maintained, USO branches at Ketchikan, Alaska, completely supported, and in the Korean War aid sent to the U.S.S. *Gunston Hall*, and to airbases at Keflavik, Iceland. Colors were presented to the First Marine Corps Women's Reserve in honor of Col. Ruth Cheney Streeter, member of the society; later, in her honor, a recreation area was equipped and presented to the Headquarters Detachment of the Women Marines in Washington, D.C.

A large endowment fund was raised for the restoration and support of Sulgrave Manor, the English home of the ancestors of George Washington.

Gunston Hall, home of George Mason, author of the Virginia Declaration of Rights, owned by the State of Virginia, is managed by a Board of Regents nominated by the National Society and appointed by the governor of Virginia.

Headquarters of the National Society is at Dumbarton House, Washington, D.C.

ELIZABETH C. KENT,
Recording Secretary.

NATIONAL SOCIETY OF UNITED STATES DAUGHTERS OF 1812, an organization founded for the purpose of memorializing historical events from the close of the war of the American Revolution to the formation of the United States (as such) and till the close of the second war with Great Britain in 1815.

This present society is the outcome of the "General Society United States Daughters 1812," founded by Flora Adams Darling in 1892, on the anniversary of the battle of New Orleans, January 8. Its work begins where that of the Revolutionary commemorative societies leaves off, namely, when the treaty of peace was ratified by the Congress in session on Jan. 14, 1784. The qualifications for membership are: Any white woman over 18 years of age, of good character and a lineal descendant of an ancestor who rendered civil, military or naval service during the War of 1812, or the period of the causes which led to that war (subsequent to the War of the Revolution), Jan. 14, 1784, to Nov. 2, 1815, may be eligible to membership, provided the applicant be acceptable to the society. The society was incorporated under federal laws in 1901.

NATIONAL TRANSCONTINENTAL RAILWAY (Canadian Government Railways). This railway is the eastern section, extending from Moncton to Winnipeg, of a railway spanning the continent, the western section of which, from Winnipeg to Prince Rupert, is called the Grand Trunk Pacific Railway. The entire system was the joint enterprise of the Canadian government and the Grand Trunk Railway. Owing to the inability of the Grand Trunk Pacific Company to operate the eastern section it was taken over by the government as part of the government railways in 1915. The Grand Trunk Railway Company of Canada amalgamated in 1923 with the Canadian National Railway Company under the name of the latter, at which time the government entrusted to it the management of the National Transcontinental Railway. See **CANADIAN NATIONAL RAILWAYS**.

NATIONAL WEALTH. See **WEALTH, NATIONAL**.

NATIONALISM AND INTERNATIONALISM.

Nationalism is a state or condition of mind characteristic of certain peoples with a homogeneous culture, living together in close association on a given territory, and sharing a belief in a distinctive existence and a common destiny. Such persons have a deep sense of belonging, a keen feeling of loyalty to the in-group, and a desire to contribute to its welfare. These sentiments lead to like-mindedness, conformity, and even exclusiveness, which find their expression in group action designed to add to the liberty, prestige, prosperity and power of the nation. Nationalism connotes a loyalty to the group entity superior to all other loyalties, a pride in its achievements, and a belief in its excellence, or even superiority over all other similar entities, and thus readily leads to aggressiveness. As such, while its greatest impulsion has come from intellectual circles, it makes its greatest appeal to the masses. This state of mind may change substantially in intensity and depth, depending upon conditions of time and place. It varies all the way from the healthy patriotism of the Swiss nation to the fanatical intolerance of Nazi Germany.

Nationality.—Loyalty to the in-group, the core of nationalism, is of a type with similar feelings of attachment to tribe, clan, caste, or city. But eventually the sights are raised, and the focus is the larger group entity, the nation or the state. Nation and state may be one and the same, as in the case of the United States; indeed, most of the states of the world today are of the nature of nation-states. But an entity may be classed as a nation because it has attained a high degree of cultural homogeneity, although it is under the domination of another power, as in the case of Poland after its partition.

The nation is an aggregate of individuals united by certain ties—political, racial, religious, cultural (including language), and historical, notably a common origin or at least a belief therein. In any particular case, it may be that not all these bonds are present. Switzerland is a strongly integrated nation, although in each of its three separate divisions a different tongue is spoken. Race is also a powerful bond of unity, but there are strong nations which seem able to get along despite the presence of several races within their frontiers. The same is true of religion. In the usual case, religion is a strong bulwark of nationhood, although some strong nations have within their borders two or more religious faiths. The most important consideration in this matter is a corporate will: a sufficiently powerful determination to live and work together. For, as Giuseppe Mazzini once said, nationalism is "the consciousness of a mission to be fulfilled for the sake of mankind. It does not depend upon race or descent, but upon a common thought and a common goal."

BASIS OF NATIONHOOD

Having defined nationalism and nationality, we may proceed now to a discussion of the basic foundations of nationhood—the factors of language, race, national character, religion, territory, political institutions, and economic integration.

Language.—The factor of national language is of the utmost importance; it can be considered the major distinguishing mark of nationality. People speaking the same language obviously can

understand one another, and this fact alone contributes to a sense of belonging, a sentiment of solidarity. Most men really feel at home only in their own tongue. Furthermore, possession of means of mutual communication permits the development of a national literature. Its earliest manifestations usually take the form of patriotic ballads and sagas, glorifying heroes and military victories in the nation's history. Thus is group loyalty inseminated. It is significant that after the Norman Conquest, English nationality had little chance to emerge before the fusion of Anglo-Saxon with Norman French to form a single English language. As the nation evolves, a writer of great eminence and force may emerge to contribute further to the creation of group consciousness, both because of the influence of his work, and because the masses, by honoring him, honor the country from which he sprang. Such a role was played in England by Chaucer and Shakespeare, in Spain by Cervantes, in Italy by Dante. It is thus evident that nothing makes a larger contribution to the emergence of a distinctive culture and way of life than the national language. The invention of printing was a milestone in this movement. The cheap newspaper which was the result of this epochal invention made possible the propaganda of the French Revolution, described below. Without the cheap printing press the emergence of the "nation in arms" in 1792 is almost inconceivable. Further proof of the close relationship between language and nationalism is found in the efforts of extremely nationalistic states to suppress rival languages and to exalt and propagate their own. In this connection should be noted the tendency of newly emancipated states to revive their ancient script, and to take extreme measures to obliterate the use of the language formerly current, especially if it is that of a hated former ruler.

It is not implied that the possession of a single national language is absolutely essential to the creation of group consciousness. In Belgium, Canada, and South Africa more than one official language is in use. The case of Switzerland has already been mentioned. But rival languages are undoubtedly a serious handicap which can be overcome only if other factors, for instance the fear of attack from abroad, are able to engender a sufficient degree of national unity.

Race.—Among the foundations of nationalism the factor of language, just discussed, is closely allied with the matter of race. When a given people is fired by a profound belief—whether true or false—that they are of common or even exclusive racial stock, they are well on their way to that group consciousness and pride which are the soul of nationalism and which sometimes develop into a belief that they are superior to all others. Many leaders have fostered the idea that their people are "God's chosen." Joseph Chamberlain wrote. "The Anglo-Saxon race is infallibly destined to be the predominant race in the history and civilization of the world." Other writers, like Hippolyte Adolphe Taine, confusing language and race, have contrived to create the myth of a peculiar Aryan race represented as superior to all others. Adolf Hitler, making wide use of the writings of Heinrich von Treitschke, Joseph Arthur de Gobineau, Adam Heinrich Müller, Houston Stewart Chamberlain, and that official spokesman for Nazi supremacy, Hans Günther, forced on the Germans that poisonous doctrine—an intolerant belief in the purity

and supremacy of the blond Nordic. This concept was invoked to justify the extermination of millions of Jews and the aggressive annexation of Austria, the Sudetenland, and Alsace-Lorraine. But while some of the worst manifestations of racialism were found in Nazi Germany and Japan, no great power has been entirely free from similar aberrations. Even small powers have given way to the temptations of racial prejudice and bigotry.

The dynamic forces of racialism are actually based on myth, but they are nonetheless potent and dangerous—since what counts in this matter is not so much what is true, but what one believes to be true. It should never be forgotten, however, that modern scholarship has demonstrated, first, that there is no such thing as a pure race and, second, that no race can be proved to be superior. This is particularly true of the Nazi concept of a distinct Nordic race, denied by all reputable anthropologists throughout the world. In fact, what is known as race is really a mere matter of environment, and race prejudice an artificial phenomenon, the creation of accident and the product of teaching and propaganda. Nevertheless, all peoples seem to be particularly susceptible to incitements through press, platform, and personal influence designed to arouse and stimulate pride of race. In fact, so great is the temptation for every nation to erect about itself high walls of race prejudice and exclusivism, that one of the first steps toward the creation of an effective international organization would have to be to break through these walls and work to promote a higher form of loyalty, namely, loyalty to the whole human race.

National Character.—A most significant factor in the evolution of modern nationalism is found in the growth of national character. That nations possess peculiar traits and distinct characteristics is generally admitted by scholars, although the latter deny that these are attributable to factors of race or origin. The explanation is found rather in the influence of environment—the effect of living together for generations under the same type of laws and government, in given conditions of economic life, territory, geography, climate, and world position, which produce a relative conformity and constancy of attitude. But national character is not completely constant or unchangeable; in the 17th century the Germans were generally indolent and peaceful, the British rebellious and turbulent. And the Americans, for so long isolationist in foreign affairs and in their relations with Europeans, curiously subject to an inferiority complex, show few signs of either of these traits today. Nevertheless, national character, and particularly a belief therein, plays an important role in the development of national consciousness. A peculiar pattern of institutions, customs and beliefs, including a distinctive development of the art forms, gives dignity to group life and a certain sense of belonging which are the very essence of the national spirit.

One important aspect of the culture pattern is a tendency to cherish historical traditions, notably by purposeful commemoration of historical events such as national independence and great military victories. Beloved national heroes of both peace and war are glorified and their praises sung. Pilgrimages to battlefields and the birthplaces of great men of the past are fostered. Such tendencies have been particularly apparent

in Soviet Russia during the years after World War II, leading many authorities to believe that Russian nationalism, rather than the propagation of world revolution, is now the chief motive force in the Kremlin.

Religion.—Religion has always played a major role in the march of nationalism, and in fact in its primitive manifestations nationalism was really a religious phenomenon. This, however, has not continued to be the case; most religions today extend across a number of frontiers, as is the case with Christianity, Buddhism, Confucianism, Judaism, Hinduism, and Mohammedanism. And in some strong nations—the United States, for instance—freedom of religion has prevailed and numerous cults have flourished. Religious differences within a given nation have hindered or postponed the spread of nationalism, and the existence of a single powerful national church has been a potent nationalistic factor. This is particularly true when adherence to a given church is shared by the larger part of the population, and even more so where the church is "national" in the sense of belonging exclusively to one state, giving the people the sense of possessing something peculiarly sacred which is all their own. That there is a deep-rooted relationship between religion and the cult of the nation is shown by the canonization of Joan of Arc, and the tendency of some peoples to revere their national heroes as saints. The extent to which religion and nationalism may go hand in hand is shown by the role of Roman Catholicism in Ireland and in Prussian Poland, in both cases the church was largely instrumental in keeping the national spirit alive in the face of foreign domination. A similar role was played by the Scottish kirk after the 17th century; it differentiated the Scots sharply from the English and fed the flame of national sentiment as probably nothing else in the circumstances could have done. Coming to modern times, Nazi Germany and Soviet Russia showed their respect for the power of the church over the emotions of the people by taking the most extreme measures to mold it according to the needs of the national myth. It is interesting, too, that at the present time it is customary for the church, even in the freest countries, to preach the necessity of loyalty to the flag and obedience to secular authority. This is undoubtedly a prudent policy, since nowhere in our present-day world is the church in a position to challenge the power of the state to hold the loyalty and fidelity of the ordinary citizen.

Territory.—The fact that a given people is conscious of living within definite frontiers on a given portion of the world's surface constitutes an important element in the acquisition of nationhood. This is true despite the cases of those nations—the Poles in Russia, the Czechs in Austria-Hungary, and the Scots in Britain—which successfully maintained an intense group loyalty and patriotism while mere subdivisions of the larger entity by which they had been subjugated. Some nations have actually been formed precisely because they were a geographic-political entity with definite frontiers. At times the acquisition of too great an expanse of national domain has weakened the hold of group consciousness; but today, due to rapidity of modern modes of travel and the existence of remarkable methods of mass indoctrination—cheap newspapers, the cinema, radio, and television—it is possible to tighten and maintain the bonds of national unity even to the

remotest corner of the widest realm. In fact, the existence of such modern methods holds out hope that some day it may be possible to inculcate a sense of group loyalty and a feeling of mutual understanding throughout the entire globe.

Political Institutions.—There is a close connection between the emergence of political institutions in a given area and the intensification of the national sentiment. Consciousness of group solidarity—to put it more simply, the ability to live together smoothly and peacefully—is undoubtedly a prerequisite to the successful operation of common agencies and procedures of government. If the integration comes about by agreement, as in the case of the 13 British colonies that joined to form the United States, such sociological-psychological solidarity may be absolutely essential. But even where unification comes about by force, unless there is a certain degree of group understanding and loyalty, the union may not be able to endure. On the other hand, the existence of common political institutions—notably a strong central government—may itself exert a commanding influence in engendering and consolidating the national sentiment of a given people. Germany's unification was finally consummated only after Bismarck had imposed on the many local and rival sovereigns of that divided country the authority of a powerful central government. In the United States, without the centralizing influence of the federal government, acting under the firm authority of a Constitution whose integrity was guaranteed by that extraordinary institution, the Supreme Court, it is difficult to conceive how national solidarity could ever have been achieved; the disastrous experience of the new republic under the Articles of Confederation shows that this assertion is not based on mere speculation. A strong government is the focus of loyalty. It is depended upon for the most vital services to the people—the public order and the general welfare at home, and security against invasion from abroad. In fact it is the supreme agency for the pursuit of unfulfilled national aspirations. As it meets these responsibilities, it is loved and respected, its leaders revered and honored. Even more, once the government has been established, it has at its disposal remarkably effective means for the spread of patriotic loyalty among the masses; it may create it by education and propaganda, or even impose it by force of law.

Economic Factors.—The division of the world into strong nations is explainable in part by economic factors. At the close of the Middle Ages, the growth of great national states proceeded hand in hand with a remarkable commercial and economic expansion. The rivalry between states was tremendously stimulated by the great discoveries and by the colonizations that followed and facilitated the acquisition by each state of a distinctive national character. Furthermore, under the influence of mercantilism, the economic life of the nation, hitherto almost purely local, took on a national character, as commerce and trade came under the control of strong centralized governments. This process was greatly stimulated by improvements in means of travel and communication. The predominant influence of mercantilism served to strengthen the hold of the government over every aspect of the economic activity of the nation. Every effort was made to render the state self-sufficient. Thus exports were stimulated, imports discouraged, and

the colonies integrated with the economic home front. This extraordinary economic expansion was buttressed by military power, notably by the building of great navies designed to protect the far-flung interests of the metropolis. In the process vast fortunes were amassed, and new heroes emerged, thus creating a new, influential class of persons, those most interested in inculcating among the masses a spirit of national exclusiveness. Furthermore, this class possessed the most potent agencies of propaganda to accomplish this purpose.

Coming to modern times, the close connection between economic factors and nationhood is quite evident. International competition for markets, rivalry for scarce raw materials, the tendency of the government to replace the individual in buying and selling in the international field, and even in banking, the frantic exclusiveness induced by depression and inflation, have led to a bewildering maze of measures of autarchy—quotas, subsidies, exchange controls, high tariffs, and other restrictions—and have served to heighten national feeling and hamper the growth of international understanding. Economic nationalism seems to be most prevalent in those countries least able to stand the pressure of international competition. The weak power is the first to suffer unrest and disunity, to demand a strong government to repress "subversion," and to set in motion the defensive and offensive measures deemed necessary to meet the emergency; but even the strongest powers have not been free from similar phenomena.

GROWTH OF NATIONALISM

Although nationalism is distinctly a modern development, its roots lie in the period when prehistoric men first organized themselves into tribes. For the tribe, with its intense religious loyalty, fierce clannishness, local pride, and hatred of the "barbarian," shows many of the traits of present-day nationalism. In tribal society, the struggle for the preservation and extension of group solidarity was waged intensively. On the other hand, the main bond among tribesmen was that of blood kinship, while relations within the tribe were personal rather than political. Moreover, at this period in man's development there was little trace of patriotism, or love of homeland; the sense of attachment to a particular territory developed later.

City-States.—The first signs of patriotism appear with the rise of the early city-states, when for various reasons—considerations of defense, economic advantages, religious values—men began to group themselves about certain vantage points. Here the growth of commerce at home and of foreign trade abroad led to the first breakup of the tribal system, and brought the first traces of the modern political system. A typical example of the early city-state—and the most famous—is provided by the story of Athens. Here was developed a strong sense of group solidarity. The citizen was conscious of a common origin, a distinctive cultural pattern, and an assumed common destiny. Cultural homogeneity was further enhanced by religious rites glorifying the national heroes and reinforcing a sense of superiority with respect to the foreigner or "barbarian." Furthermore, the citizens had become attached to a given territory. Thus in Athens we find many of the elements of modern nationalism.

But the city-states gave way to the patriarchal empires, a process brought about by the expansion of one city-state or its conquest by a rival power on the rise. Such expansion augmented the national pride of the conquering power, kindling further the national spirit, and at the same time served to intensify the group loyalty of the submerged or conquered minority. The best example of such an entity is the great Roman Empire. In its aggressive, unprincipled and hypocritical foreign policy it reminds us of the integral nationalism practiced by Hitler and Mussolini. But it lacked the cultural homogeneity, the intense feeling of patriotism, and the overall sense of loyalty to a state or sovereign characteristic of nationalism as we know it today.

Middle Ages.—If, in the city-state and the patriarchal empire, the historian can find many of the typical features of present-day nationalism, the same cannot be said of the period of the Middle Ages. The basic unit of political organization, the feudal domain, did not lend itself to the development of group solidarity, nor permit the growth of any national sentiment. Mankind in general lived in groups too isolated, too poor and small, too provincial, to feel any sense of attachment to a national or cultural entity. Medieval towns, in general, were so separated from one another and so dominated by a spirit of localism that they could not serve as the basis for any larger group loyalty. Furthermore, there existed a measure of universal solidarity which was incompatible with the separatism characteristic of nationalism. The church was a major focus of individual loyalty, and its sway was almost universal. The Holy Roman Empire, too, despite its weakness, exercised for a considerable time a cosmopolitan influence. In this matter it is significant that nationalism evolved most rapidly in those lands, notably in France and England, where the imperial power was most remote and its influence weakest. Another factor was the existence of a fierce parochialism within each entity later to become a nation; thus where Scottish clan hated its neighbor clan there was little chance, except perhaps in time of great peril, that all the clans together could feel a national spirit of solidarity as against England or even France. It was necessary to await the consolidation of the king's authority over the realm before the nation could emerge. Here the work of Henry IV in France and of Henry VII and Henry VIII in England is most significant. This crucial task accomplished by the monarch was made possible by a great commercial revolution, enabling a new middle class to emerge, which allied itself with the king and gave him the support required to overcome the anarchy and decentralization of the feudal system. It is also worth noting that national consolidation was accomplished earliest where the geographical situation was most favorable, as in England, isolated as she was from the Continent, and in France, where the king could operate from the strongly fortified bastion built about Paris, in the region known as the Ile de France. The process of consolidation went on in England, Spain, France, Russia, and Poland, with the result that by the middle of the 18th century national states had emerged in most of Europe. In the Balkans, however, and in Germany and Italy, this movement was postponed for another hundred years.

As powerful monarchs were gradually establishing their authority and laying the foundation

for separate statehood, other important influences were at work. One was the slow but sure development of national languages, already discussed. This came about hand in hand with the weakening of Latin as the language of universal use for education, literature, and diplomacy. As a consequence national literatures emerged, permitting the dissemination among the masses of works which kindled the national spirit and engendered a consciousness of separate existence. Another result was the weakening of the church's hold over education, which gradually became more and more secular and at the same time less universal in outlook.

The Reformation, the rise of Protestantism, and the growing emphasis upon national churches all contributed to the consolidation of separate, exclusive states. For instance, Presbyterianism in Scotland served to quicken the parochial spirit of its people and give them a sense of national exclusiveness. In Germany, the effect of Martin Luther's famous addresses was the amalgamation of religion and patriotism into a militant national faith.

Another influence favorable to the emergence of modern nationalism was offered by the great discoveries and the ensuing economic expansion of Europe. The bitter rivalries thus engendered fed the national spirit, the glorious deeds of discovery fired the national pride, and the great wars which followed had a dynamic and lasting effect in this same direction. Finally the traders, bankers, and shippers, a new class representing vast wealth and wielding great influence, were not slow to feed the flame, for they realized the necessity of gaining the support of the citizens, from whom they had to enlist the sailors and the fighters if the nation was to keep pace with its rivals. In this connection the role of mercantilism must not be neglected—the narrow commercial policies adopted in most states after 1500. This system operated to promote interstate rivalry and jealousies, intensify national pride, and promote international friction. It was therefore a heady stimulant to the pride and arrogance of nations.

The major role played by the monarch in laying the basis for the modern national state has already been mentioned. The local sway of the feudal lords and barons gradually had to give way before the emerging power of the king, permitting the development of national instrumentalities of government and the establishment of the "law of the realm." This was particularly true in England, where the common law finally consolidated its hold over the entire country, contributing immeasurably to the consciousness of the citizens that they were set apart from the rest of the world. In some states the appearance of democratic government was a further step in this direction.

The French Revolution.—It is impossible to fix a date for the beginning of modern nationalism. The underlying social, economic, political, and intellectual forces accomplished their work only gradually, and at a different rate in each region depending upon the peculiar circumstances of the particular case. Some authorities place the actual origins of modern nationalism at the time of the Reformation; others date it from the Peace of Westphalia in 1648, which ushered in the modern system of independent sovereign states. Still other authorities, and they represent the majority, insist that nationalism as we know

it began with the French Revolution. But, as we have seen, the way had already been opened by the emergence of a system of strong, well-integrated states, the work of powerful monarchs. Also, the minds of men had been prepared for the spirit of nationalism by the teachings of the Enlightenment in the 18th century. The great apostle of modern nationalism was Jean Jacques Rousseau. He stressed the value of the moral unity of the masses, who are bound together in pursuit of a common purpose—the good of the whole. Furthermore, he insisted that the community should be governed by laws issuing from the people themselves, and not from a divine-right monarch standing above the law. He emphasized the necessity of a supreme loyalty to *la patrie* (the fatherland), a duty so sacred as almost to become an article of religious faith. He decried any idea of fidelity to something higher, for instance world society or the entire human race. In short, he sought to arouse the masses to a belief in a common heritage and a common destiny, claiming for men a status of democratic equalitarianism, and for nations a right of self-determination. It was for the men of 1789 to put these principles into practice, at least for a time.

At first professing absolute fidelity to the doctrines of popular sovereignty, individual liberty, social equality and fraternity, the Jacobins, under the stress of rebellion at home and attack from abroad, soon allowed the movement to deteriorate. Force and militarism took precedence over humanitarianism and fraternal love. The movement became fanatical. Soon there began to emerge those remarkable instrumentalities of nationalism which have been so widely employed ever since, notably by totalitarian dictatorships, but which have not been neglected by the most advanced democracies. The concept of the "nation in arms," universal conscription, emotional appeals for flag and country, the composition of a national anthem, the glorification of national heroes, the establishment of a system of public education grounded in the vernacular and dedicated to spreading revolutionary doctrines, insistence on the universal use of the French language, invention of a new kind of popular journalism and, finally, the organization of impressive rituals in the form of national ceremonies—all were employed as part of a vast scheme to create and intensify a national cult.

The doctrines of the revolution were professed to be universal—not designed for Frenchmen alone—but before long the Jacobins were thinking in terms of selfish national interest. They embarked on expansion and conquest. Nationalism, then as always, feeds on war. As the sans-culottes marched to do battle abroad, they took their doctrines with them, and they spread their nationalism much faster than their democracy. This was true even before the rise of Napoleon, but when the Little Corporal assumed power he greatly intensified the development already under way. Fortified by supreme power and an admirable political organization and system of laws, he made excellent use of all the Jacobin paraphernalia of nationalism, employing it to the limit of his own keen shrewdness. Thus he was able to indoctrinate a whole generation of Frenchmen with the concepts of "glory." He taught lessons in this field which later governments, especially in other countries, have never forgotten. Everywhere he awakened submerged peoples to a

sense of their own destiny, and thus did much to start Italy and Germany on that march for unity which they were to achieve several generations later. In fact Napoleon, who was actually destroyed by the dynamic national spirit he did so much to create, initiated the upheaval which ultimately transformed the continent, dividing it into separate entities inspired by the fervor of nationalism.

The metamorphosis of French nationalism after 1792, transformed as it was from a liberal, universalist movement into one marked by reaction and conquest, illustrates a point already made, namely, that nationalism is always a creature of environment, subject to change. It can be democratic, liberal, or fascist, according to circumstances. At times it may not exceed the bounds of a healthy patriotism, at others it will be the cause or the result, or even both at once, of expansionism and war. The story of nationalism since 1815 will bear out this assertion.

The 19th Century.—The 19th century has been called by some authors the great age of nationalism. During most of the century, after the aberrations of the Jacobins and Napoleon Bonaparte, what has been called "liberal nationalism" was revived and became predominant. This is a type of group consciousness characterized by intense patriotism and loyalty but faithful to the doctrines of individual and national freedom, in other words, espousing human rights and the right of self-determination of peoples. It tends to be high-minded and altruistic, universalistic and pacific. One of the greatest movements to be inspired by this spirit was the American War of Independence. This revolution was liberal and humanitarian, fought in the name of the great liberal principles dating back to John Locke and the Puritan Revolution, so admirably reformulated by Thomas Jefferson and Thomas Paine, and immortalized in the Declaration of Independence. In Britain, under the influence above all of Jeremy Bentham, liberal nationalism reached its highest point in the 19th century. As an intellectual movement it spread throughout western and central Europe. Based mainly on the middle classes, highly tinged with romanticism, and preaching the doctrine of free trade, this school of thought adopted certain typically Jacobin ideas, namely free popular education, universal military service, and popular journalism. These ideas were disseminated with great force and effect by Mazzini, who, as spiritual leader of the movement for unity and independence in Italy, became the most influential apostle of liberal nationalism in the entire century. Other leading philosophers of this movement were Giuseppe Garibaldi in Italy, Victor Hugo in France, and William Ewart Gladstone in England.

A major factor in the extraordinary emergence of nationalism during the 19th century was the first Industrial Revolution. By this is meant in general the amazing series of mechanical inventions ushered in by the invention of the flying shuttle in 1733 by John Kay. In modern states industry and commerce, and eventually society as a whole, were actually transformed by the developments made possible by the work of Thomas Savery, Thomas Newcomen, and James Watt in steam power, Sir Richard Arkwright and Samuel Crompton in textile manufacture, the Abraham Darbys and Henry Cort in coal and iron,

Sir Henry Bessemer in steel, and other pioneers. The consequences were incalculable. Mass production was introduced, great factory cities created, a working class or proletariat developed. Also, a new middle class was engendered, and the ranks of the capitalist class greatly augmented, from which the "empire builders," the keenest nationalists, emerged. The power of states to produce and to expand increased immeasurably. Demand for outlets for the investment of capital, and the need for raw materials to feed the hungry new factories led to the search for new possessions in distant regions—or gave empire builders the pretext to undertake such a search—and this meant a new wave of colonialism and imperialism. Exploits of adventurers and military geniuses like Robert Clive and Cecil John Rhodes were both a cause and a consequence of a new, intense kind of national pride. Another result was the development of modern methods for the communication of intelligence—through rail, telegraph, telephone, and cheap newspapers.

Major events of the 19th century owe their impulsion to the irresistible forces of nationalism. Greece and Belgium won nationhood early in this period. Nationalistic fervor inspired the great uprisings of 1830 and 1848. Across the Atlantic nationalism inculcated the Spanish and Portuguese colonies in Central and South America, which were able to win their independence, inspired and led by heroes such as Simon Bolívar and José de San Martín. During the two decades after 1855 both Germany and Italy belatedly won their unity through the genius of Prince Otto von Bismarck and Conte Camillo Benso di Cavour, respectively. Serbia, Rumania, and Montenegro won their liberty in 1876. Bulgaria was separated from Turkey. On the other hand, the Poles, Finns, Letts, Czechs, and Croats, among others, continued to be persecuted and oppressed, but this only served to solidify their national loyalty and to push them toward the independence they were later to win and—in some cases—to lose once again. Late in the century Japan, inspired by a high degree of national aspiration, became a world power. Since most of these events occurred through rebellion or war, it is evident that the pacifist slogans of liberal nationalism were often more honored in the breach than in the observance. Furthermore, as has so often been demonstrated, movements initially high-minded and altruistic readily deteriorated into **expansionism**, aggression, and war.

One may cite as examples Napoleon III and Bismarck, whose policies, originally professing fidelity to the doctrines of liberalism, eventually became reactionary and aggressive. Bismarck's unification of Germany was conservative and authoritarian, but Germany's annexation of Alsace-Lorraine in 1871 was accomplished in violation of the tenets of self-determination.

Toward the end of the 19th century came a remarkable intensification of nationalism, due in great part to a new industrial revolution. This caused Europe to burst its economic bonds and spread its power and influence throughout the world. New markets were sought in far-off China and Africa. A new wave of expansionism was initiated, as France spread further into Africa, encouraged by Bismarck after the debacle of 1871, and the British obtained control of Suez and embarked on new adventures in colonialism. Germany, too, seeking a "place in the sun,"

sought to extend her sway from Berlin to Baghdad. Even the United States was caught up in the current, and after a successful war with Spain found herself ensconced in Puerto Rico and the Philippines. New rivalries and frictions resulted, with new dangers of war, narrowly averted, as France and England clashed over Fashoda (now Kodok), Germany and France over Morocco, Russia and England over Persia. Grandiose schemes of expansion were dreamed up, mutual fears exacerbated, and a great armaments race launched. Some started new powerful navies, others augmented their existing naval power, compulsory military service was established in many lands, and in general the atmosphere was prepared for that great turning point in history, the explosion at Sarajevo.

The 20th Century.—As already remarked, the 19th century has been called the age of liberal nationalism, although it must be admitted that both at the beginning and at the end of that period, nationalism of an extreme variety was current. But if the 19th can be considered the century of liberal nationalism, certainly the 20th is the period of integral or fascist nationalism. The first decade, it is true, was relatively calm, and great hopes were held out for peace and security by optimists who reflected the spirit of the two Hague Conferences of 1899 and 1907. But these hopes were shattered in 1914. The nationalist and imperialist rivalries prior to 1914 undoubtedly contributed to the outbreak of World War I. In fact, nationalism was both a cause and a result of that conflict.

Since World War I the most dynamic manifestations of nationalism have occurred in authoritarian states, notably in Nazi Germany, the new Japan, Fascist Italy, and Soviet Russia. Some smaller states, too, have fallen under its sway—Juan Domingo Perón's Argentina, Francisco Franco's Spain, Antonio de Oliveira Salazar's Portugal, and Tito's Yugoslavia. Yet the Treaty of Versailles had been signed in an atmosphere of liberal nationalism. Woodrow Wilson's Fourteen Points were an expression of this philosophy, and the peace settlements were inspired in principle by the tenets of national self-determination, as shown by the establishment of the mandates scheme of the League of Nations, the creation of a free Poland, and the breaking up of the Austro-Hungarian empire into states based on national integrity. Unfortunately, however, many of the solutions adopted in 1919 ran counter to the Wilsonian ideal, for the American president was unable to obtain acceptance throughout for the formulas contained in his Fourteen Points. In defiance of the explosive verities of self-determination, new grievances were perpetrated. A status quo in which one finds a Fiume (now Rijeka), Shantung, or South Tirol, not to mention the Saar and the Polish Corridor, could hardly be expected to endure. In fact the eventual breakdown of the Versailles settlement, as well as the demise of the League of Nations, can be traced in large part to the injustices perpetrated in 1919 in violation of basic concepts of liberalism and self-determination. For one major cause of international disputes and resulting wars is simply unjust treatment meted out to helpless states, especially if they eventually become powerful enough to threaten the status quo.

Except for a brief period of comparative peace and optimistic hopes, extending roughly from

1920 to 1929, the world since World War I has been in almost constant turmoil. One of the major characteristics of the period—both a cause and a result of its cataclysms—has been the manifestation of extreme nationalism. No state has been free from this phenomenon, but in certain authoritarian powers nationalism has reached a pitch of frenzy never before seen, not even in the wildest days of Jacobin fanaticism. Thus Benito Mussolini, a follower of Niccolò Machiavelli, Auguste Maurice Barrès and Georges Sorel (the apostle of violence) rather than of his liberal compatriot, Mazzini, indoctrinated a generation of Italians with the most extreme type of nationalism. Japan, already strongly nationalist, destroyed its democratic trappings in the early 1930's and became more and more rigorously fascist at home and expansionist abroad until it finally broke completely with the family of nations and embarked on total war. In fact, some authorities, contrasting Japan's meticulous compliance with international law during the Russo-Japanese War (1904-1905) with its incredible atrocities in World War II, ascribe this change to the purposeful inculcation among the masses of new doctrines of extreme, fanatical nationalism. The expansion which began in Manchuria finally overran Singapore and New Guinea. Hitler, destroying the democracy of the Weimar Republic, imposed a ruthless dictatorial regime on his people, broke the chains of Versailles, rearmed the nation, and marched into the Rhineland, Vienna, and later Prague. He took the final step when he attacked Poland in 1939. By his violent racial doctrines, his anti-Semitism, his bitter, intolerant, violent demand for absolute fidelity to a mystical and all-powerful Reich, and his control of the German mind through the corruption of press, platform, radio, the schools, and the universities, Adolf Hitler made himself the god of modern integral nationalism. He outdid Robespierre and Napoleon, and surpassed Barrès, Sorel, and Houston Stewart Chamberlain.

While the actual origins of great wars are difficult to determine, Hitler's aggressive imperialism and fanatical expansionism, seconded by a Mussolini already well schooled in such doctrines and with hands still bloody from his Ethiopian conquest, undoubtedly were major causes of World War II. Characteristic of this spirit is a negation of all humanitarian values, an uncompromising rejection of liberal and progressive principles, a total subjection of the individual to the domination of an all-powerful state, whose worship is postulated as a sacred, almost religious duty, and a devotion to the devastating doctrine that, in the pursuit of the national interest, any means is justified by the end in view. In a world imbued with this spirit, war is almost inevitable, and free nations can only conserve their liberty by constant vigilance and a determination to keep their powder dry.

Since World War II, nationalism has continued to play a major role throughout the world. The Hitlerian techniques were developed still further by Joseph Stalin, who proved himself an apt pupil of fascist nationalism. In Soviet Russia nationalism, stealing the show from the universalist doctrines of world communism, has inspired an expansion as rapid and as extensive as any in the history of the world. Many of the nations liberated after World Wars I and II have been subjugated anew, again as a result of a spirit of nationalism, but this time of a very

different kind. This is true of Poland, Rumania, Czechoslovakia, Hungary, and China, although Yugoslavia, again due to the force of nationalism under a stubborn leader, Tito, has thus far escaped. Nor should we forget the fate of the once-free states, liberated as a result of World War I—Estonia, Latvia, and Lithuania. Elsewhere, however, the effect of nationalism has been to liberate certain regions from colonial rule. Thus India and Burma have separated from Britain, and Indonesia from the Dutch, while Indochina, Morocco, Tunis, and even Algeria strain at the leash of French sovereignty. In fact the slogan so often heard, "Colonialism is dead," is merely a general recognition of the liberating force of nationalism in the world today.

MAIN CHARACTERISTICS OF NATIONALISM

A brief description of the basic features of nationalism may serve to explain the nature of its dangers to individual states and to world peace.

Relativity.—As already suggested, the exact character of any particular case of nationalism is largely determined by environment. The state of mind of a given people may be entirely transformed according to changes in time and circumstance. Nationalism in the United States itself has shown significant variations explainable by factors of changing environment. Thus, while the Revolution was fought in a spirit of liberal nationalism which Locke and Rousseau would have applauded, the Spanish-American War was initiated in a wave of imperialist emotion. And the retreat from Europe and the League of Nations after 1920 was a clear manifestation of exclusive, isolationist nationalism. In World War I the general sentiment of the masses, even after American intervention in the conflict, remained basically isolationist. This is in sharp contrast with public opinion throughout World War II, at least after Pearl Harbor, for despite a national patriotism that reached a high pitch of intensity, Americans never faltered in their hopes for a new international organization which, it was confidently expected, would serve to ensure peace and security once the victory had been won. It has only been because of the disillusionments of the peace, and particularly since the outbreak of the "Cold War," that American nationalism has tended to become once again to some degree self-centered and isolationist, with some unmistakable signs of exclusiveness and intolerance.

Artificiality.—If nationalism is environmental, it is also to a large extent artificial. It is not a harmonious, natural growth, but the result of a long process which reaches its climax only after a given people has spent a long period of living and working together. This process can be greatly accelerated, however, by various methods, today only too familiar, of purposeful stimulation. In other words, nationalism is a state of mind which can be, and often is, induced by governmental and private propaganda. It can be the creature of ambitious leaders who wish to form certain patterns of opinion which they expect to use, for their own purposes perhaps, or for ends they consider to be in the public interest.

The most volcanic degrees of nationalism have been consciously and insidiously contrived. The fanatical propaganda of the French Revolution, the press-radio-platform paraphernalia of Joseph Paul Goebbels, the "brain washing" technique pe-

cular to communism, are striking examples of such methods. In this process, the youth of the nation is singled out as most impressionable and most easily molded. The effort is begun among the youngest children, and includes attempts to enlist the active support of family and school. The Germans under Hitler, and the Russian Communists today, have developed their techniques in this matter to the pitch of perfection. No age-group, no portion of the population, is neglected. The nationalist organizations take the form of clubs, cells, societies, or parties, and all cooperate to augment the fanaticism of the masses to the greater glory of the state. Glorify the nation, exaggerate its accomplishments, convince the masses that they constitute "God's chosen people," spread broadcast the slogan, "My country right or wrong," or, even more lethal, "My country always right," establish a conviction that the fatherland is in imminent danger of attack (whether this be true or false) and, over it all, obliterate all sense of measure, any vestige of objectivity, and one has all the ingredients for concocting a high degree of extreme nationalism. In this matter the most effective formula appears to be a close cooperation of thinker and actor; someone must furnish the doctrine, but someone else must be ready to propagate it among the masses. Lazare Carnot and Bertrand Barère provided the philosophy, Robespierre and Napoleon put it into practice. Alfred Rosenberg wrote the doctrines (acquired abroad from Sorel, Charles Maurras and others, but with valuable assistance at home from Georg Wilhelm Friedrich Hegel and Treitschke), while Goebbels gave these doctrines violent application.

Irrationality.—The ability of governmental and civic leaders to spread the ferment of nationalism among the masses is greatly facilitated by its highly irrational character. The extreme patriot is largely impervious to rational argument. Even in free countries, he may never hear the truth, especially if he reads only tendentious newspapers or tunes in his radio to biased, chauvinistic commentators. Moreover, it is difficult to see how adults can consider the international problems facing their nation with any degree of objectivity if as young children their minds were formed by history books that were one-sided and biased.

Intolerance and Exclusivism.—In early times, man's supreme loyalty was centered on his religion. Today this place has been taken by the nation. As the most despised of antisocial individuals within the state, the traitor has displaced the heretic. This supreme loyalty is not only self-centered and exclusive; it has likewise a curious negative element. It thrives on anti-foreign sentiment, especially when this can be focused on a particular country, the object of special disdain. Thus the nationalism of the United States has been traditionally anti-British, that of England has been anti-French, that of France anti-German, while Polish nationalism (probably the most intense of all) has been anti-Russian and anti-German. A striking contemporaneous illustration of this phenomenon is found in the case of the USSR, whose integral nationalism is so violently anticapitalist. Given the atmosphere of exclusivism in which it flourishes, together with its negative character, nationalism is both a cause and a consequence of intolerance. Intolerance of all criticism of one's own government or its policies may result in the total suppression of free speech.

Intolerance of foreigners, both as individuals and in the mass, and refusal to examine calmly and objectively the policies of a foreign government, tend to create an attitude favorable to international dispute and war; or it may take the form of arrogance toward the immigrant, an attitude which may go all the way from social discrimination to the passage of laws denying the foreigner comparable economic opportunities in particular or, in general, equal protection of the laws. Nationalistic intolerance finds expression in many countries, in various methods of oppression directed against devotees of religions having an international character, national minorities, members of so-called "inferior races," and persons espousing economic and social doctrines of foreign origin.

INTERNATIONALISM

Various meanings are attached to that elusive term, internationalism. To some it is a method of international cooperation, comprising a complex of instrumentalities of interstate organization—League of Nations, International Labour Organization, the International Court of Justice, World Bank, United Nations—and includes in its purview their origin, evolution and activities. To others the term means, in common with nationalism itself, a certain condition of mind, and it is in this sense that it is used here. Thus interpreted, internationalism means a consciousness of membership in a global society, or community of the peoples of the world, and a willingness to allow one's particular nation to join the existing organizations established by and for this community. It also includes a disposition to surrender to world institutions a greater or less degree of sovereignty, depending on the intensity of one's faith in the available methods of international cooperation. The "minimalist" would be willing to grant to a global institution only those powers considered essential for the maintenance and enforcement of international security. The "maximalist" is a partisan of some form of actual world government. The former champions the present United Nations; the latter will be found in the ranks of the world federalists. Between the two extremes one will find varying degrees of internationalism. This attitude or state of mind is unlike cosmopolitanism in that it does not imply an abandonment of one's loyalty to his particular state or nation, or a disposition to substitute for his attachment to the latter a higher relationship to the whole world, regarded as the only true fatherland.

It was only following World War I that internationalism as just defined reached the stage of practical experimentation. True, the way had been prepared for centuries, as advanced thinkers—Henry IV's great minister, the duc de Sully, Immanuel Kant, William Penn, and many others—formulated utopian plans for world organization designed to end war and maintain peace. But little came of these plans until 1919. Considerable progress had already been made, to be sure, in the field of international law, especially since 1648, and international arbitration had come into fairly frequent use during the 19th century. Two Hague Conferences, in 1899 and 1907 respectively, had spread the hope—too optimistic, so it turned out—for the codification of international law and the settlement of international disputes by peaceful means. But the actual birth of internationalism did not occur until the founding of the League

of Nations in 1919. The growth of internationalism from this point on is discussed in other articles. See LEAGUE OF NATIONS; UNITED NATIONS, THE; INTERNATIONAL COURT OF JUSTICE; INTERNATIONAL LABOUR ORGANIZATION; INTERNATIONAL LAW, CHANGES IN.

There is no incompatibility between liberal nationalism and a spirit of internationalism. If kept within reasonable limits, a healthy patriotism is a great spiritual force. In fact, it is a prerequisite to the spirit of fidelity, faith, and determination among the citizen body which is the soul of nationhood. Unless its people possess a high degree of loyalty and solidarity, no nation can endure in the present competitive world. But nationalism that is narrow or egotistical is incompatible with any degree of progress toward internationalism and will, as history demonstrates, become a lethal weapon of discord and conflict.

JOHN B. WHITTON,

Associate Professor of Politics, Princeton University.

NATIONALIST, in British politics, a term applied to the Irish political party whose program included a partial separation of Ireland from Great Britain. The party was organized by Isaac Butt, and after his death was ably led by Charles Stuart Parnell. After Parnell's death it was split into factions but was reunited in 1899 under the leadership of John E. Redmond. Its principal services to the Irish nation were the settlement of the land troubles and the establishment of institutions for the higher education of Catholics. The party, however, failed to keep in touch with the younger generation in Ireland; more and more it came to resemble the great parties of England; only men who pledged docility to its leaders received its support at elections. The cleavage between people and party became apparent soon after the outbreak of World War I in 1914, and after the revolt in 1916 the support of the masses was withdrawn altogether. At the various subsequent by-elections throughout the country the party's candidates were defeated by the Sinn Féiners. With the establishment of the Irish Free State the

party ceased to exist, as its purposes had been accomplished, although not precisely as some of its members would have wished. Some former Nationalists took an active part in the new government, while others for various reasons remained aloof.

NATIONALITY. Nationality is both an ethnic and a legal term. As an ethnological concept it has reference to the racial status of an individual or group. Thus we speak of an individual possessing German, Polish, Italian or Greek nationality, without regard to his citizenship, for the terms citizenship and nationality are not synonymous. In general, people who have a common ethnic origin, who speak the same language and who have a common literature belong to the same nationality although they may be citizens or subjects of different states. Thus we find large numbers of persons of Polish nationality in Germany, Austria, USSR, and other states; Germans are found not only in East and West Germany, but in Austria, Switzerland and other countries; persons of Jewish nationality are widely scattered over the world and are citizens or subjects of many states. States and nations are, therefore, by no means identical; some states, like Austria, Hungary, the USSR and Switzerland, embrace within their territorial limits various nationalities.

On the other hand a nation may extend beyond the limits of a single state. Thus the French nation embraces practically the whole of the French Republic and most of Belgium. The Germanic nation extends beyond the limits of East and West Germany into Austria and Switzerland. The tendency of modern times has been toward identification of states and nations, that is, toward the organization of states with boundary lines which coincide with those of nations, this on the principle that the bringing of peoples having a common ethnic origin and language under the same state organization conduces to national unity and stability. The organization of the German and Italian states along national lines during the last century was in accord with this tendency. Disregard of this principle, as, for example, by the Vienna Congress in 1815 which undertook to reorganize the states of Europe without regard to considerations of nationality, has led to extremely unfortunate results.

As a term of municipal and international law nationality has reference to the status of an individual as a member of a particular state. In this sense the term is synonymous with citizenship (q.v.) though not invariably, for an individual may for certain purposes be a "national" of a particular state without being a citizen or subject in the full sense of the term. The term may also have reference to the national status of a ship or cargo.

The nationality of an individual is determined by municipal or state law while that of a ship or cargo is regulated for the most part by the rules of international law. As a consequence of the former principle it may and does frequently happen that two or more states lay claim to the allegiance of the same person. In that case the individual possesses a double nationality. Likewise it may happen that an individual is without any nationality at all, that is, he is *staatlos* or *heimatlos*, as the Germans say. Cases of dual nationality arise from the exist-

ence of two conflicting systems for determining nationality. These two systems are known as the *jus soli* and the *jus sanguinis*. According to the former rule nationality is primarily determined by the place of birth; according to the latter, by the nationality of the parents. The *jus soli* rule grew up in Europe during the feudal period and in time it became the general law on the subject on the continent of Europe. In the later Middle Ages, however, it was largely superseded by the *jus sanguinis* rule which originated in the Roman law. According to the strict principle of the *jus soli* all persons born within the jurisdiction of a particular state, regardless of whether the parents be citizens or aliens, are deemed to be citizens of that state. Likewise all children born abroad, even though their parents be citizens, are regarded as aliens. On the other hand, according to the strict principle of the *jus sanguinis* all persons born within the jurisdiction of a particular state, of parents who are aliens, are themselves aliens, while those born abroad of citizen parents take the nationality of their parents (or rather that of the father, in case of legitimate children, and that of the mother, in case of illegitimate children).

The *jus soli* principle is the basis of the law of Great Britain and the United States; the *jus sanguinis* rule prevails in Germany, Austria, France, Hungary, Switzerland and other states. Few states, however, apply either principle exclusively. Thus according to American law children born abroad of fathers who are citizens of the United States and who have themselves resided here are deemed to be citizens of the United States. Likewise, according to British law, children born abroad of British subjects are treated as natural-born British subjects. Thus both countries, although following in general the doctrine of the *jus soli*, have adopted the *jus sanguinis* principle for determining the status of children born abroad of citizen parents. In many other states a mixed system prevails. Thus according to French law while all children born of French parents anywhere in the world are deemed to be French citizens, those born in France of alien parents and not domiciled in France at the age of their majority are regarded as foreigners. A child, therefore, born in the United States of French parents would be a citizen of the United States *jure soli*, but a citizen of France *jure sanguinis*.

Concerning the test for determining the nationality of ships in time of war there has been much diversity of opinion. The continental European view has generally been that national character in such cases should be determined by the nationality of the owner; English and American opinion, however, has regarded the flag which the ship is entitled to fly as the proper test. During the World War, however, the British government rejected the former rule and put into effect the rule that the neutral or enemy character of a vessel should be determined by the nationality of the owner. See also ALLEGIANCE and CITIZENSHIP IN THE UNITED STATES. For bibliography see article CITIZENSHIP IN THE UNITED STATES.

JAMES W. GARNER,

Late Professor of Political Science, University of Illinois.

NATIONALITY ACT OF 1940. This act replaces the several acts of the Congress providing for the naturalization of persons serving in the armed forces of the United States. The new code contains a section applying uniformly to persons who served honorably in the army, navy, marine corps, or coast guard for an aggregate of three years. Under the law the five-year period of residence in the United States, declaration of intention to become a citizen, and certificate of arrival and residence within the jurisdiction of the naturalization court are no longer required. Proof of good moral character and favorable disposition toward the country is facilitated for applicants.

The code broadens the prohibition against the naturalization of persons who are members of anarchistic or other subversive groups or who believe in, or advocate, subversive doctrines or sabotage. The prohibition is applicable to any person who within ten years prior to filing a petition for naturalization has entertained any such views or has been affiliated with any organization or group of a subversive nature, even though such views or affiliation may have been abandoned before the filing of the petition.

Another provision in the new code permits the acquisition of citizenship by children through adoption by citizen parents. They may be naturalized before reaching the age of 18 upon petition of the adoptive parent or parents, provided they were admitted to the United States for permanent residence, were adopted in the United States before reaching the age of 16, and were adopted and in legal custody of the adoptive parent or parents for at least two years prior to the filing of the petition for the child's naturalization.

NATIONS, Law of. See INTERNATIONAL LAW.

NATIONS, League of. See LEAGUE OF NATIONS; WAR, EUROPEAN: PEACE TREATIES.

NATIVE BEAR, the Australian koala (q.v.).

NATIVE COMPANION, an Australian name for a large local crane (*Grus australasianus*) peculiar to that island-continent.

NATIVISM, that theory which bases some tangible part or phase of our knowledge on the inborn nature of mind and not on sense-experience alone. It is opposed to empiricism (q.v.), which finds in sense-experience the origin of all knowledge. While the distinction between truths of reason and truths of sense dates from Heraclitus, or even earlier, Plato was the first to make nativism a leading tenet of his philosophy. Over against the knowledge of sense, he maintained the existence of a knowledge of ideas due to a recollection, stimulated indeed by sensory experience, but reaching back beyond birth. Aristotle's views as to the origin of knowledge, though not greatly emphasized, seem to be essentially of the same nature as those of Plato. The Stoics were the first to use the word *innatus* or truths, applying it primarily to the moral law. The realists of the Middle Ages, holding as they did that universals have a separate existence, were practically driven to nativism, unlike the nominalists, who maintained that nothing is in the intellect which was not previously in sense. In modern times nativism and rationalism have gone hand in hand, and Descartes, Spinoza and especially

Leibniz believed in the existence of innate ideas, such as those of God and of the self. Locke opposed this opinion, and pointed out that the new-born child does not possess a ready-made stock of ideas. Kant maintained a theory of knowledge essentially nativistic, but departed from his predecessors in not making knowledge consist in the possession of representative ideas and in holding that the phase of knowledge independent of sense—the knowledge of pure form—is not so much congenital as extra-temporal. The modern discussion of evolutionism has given a new turn to nativism, in that some writers, such as Spencer, have upheld the view that the knowledge of the individual is in a large measure inherited racial experience. However, according to Weismann's theory of evolution, acquired characteristics cannot be inherited, so that racial experience can have no direct effect on the individual. The innate substratum of the mind, on this theory, is the result of the accumulation of fortuitous variations which have been able to survive through special fitness. Neither this view nor Spencerianism are in the original sense forms of nativism, since the sort of innate knowledge which the classical nativism maintains is the same in nature for all minds.

It is not essential for nativism to maintain that the new-born babe actually has certain conceptions perfectly formed, or that he will form them without any sensory stimulus. An item of knowledge may be innate even if it requires experience to evoke it. For this reason Locke's refutation of Leibniz will not hold water. On the other hand, to be an antithesis to empiricism, the nativist must maintain, not merely that the general nature of man is a condition of all sensory experience, for the empiricist would agree with him in this, but that some phase of knowledge, such as that of necessary truths, is peculiarly dependent on the nature of thinking minds themselves. S., 'A System of Logic' (London 1843); Moore, G. E., article on 'Nativism and Empiricism' in 'Baldwin's Dictionary of Philosophy and Psychology' (new ed., New York 1911); Plato, 'Meno'; 'Phaedo'; 'Theaetetus'; Zeller, 'Stoics, Epicureans and Sceptics' (tr. London 1892).

NATIVITY, in *astrology*, the theme or figure of the heavens, and particularly of the 12 houses, at the moment when a person is born, supposed to indicate his future destinies, and synonymous with *horoscope*. See **ASTROLOGY**.

NATORP, nã'tòrp, **Paul Gerhard**, German scholar: b. Düsseldorf, 24 Jan. 1854; d. 1924. He was educated in Berlin, Bonn and Strassburg and accepted a professorship in Marburg in 1885. He wrote 'Descartes' Erkenntnistheorie' (1882); 'Platos Staat' (1895); 'Platos Ideenlehre' (1903); 'Socialpädagogik' (3d. ed. 1909); 'J. H. Pestalozzi' (2d. ed. 1910); 'Die logischen Grundlagen der exakten Wissenschaften' (1910); 'Philosophie: ihr Problem und ihre Probleme' (1911); 'Hoffnungen und Gefahren unserer Jugendbewegung' (1914).

NATROLITE (from "natron," native carbonate of sodium), a native hydrous silicate of

sodium and aluminum, having the chemical formula $\text{Na}_2\text{Al}_2\text{Si}_2\text{O}_{10} + 2\text{H}_2\text{O}$, and crystallizing in slender prismatic forms belonging to the orthorhombic system. It is transparent to translucent, and usually white (or nearly so), with a vitreous lustre, a hardness of from 5 to 5.5, and a specific gravity of from 2.20 to 2.25. It occurs in cavities in basaltic rocks, and in seams in granite, gneiss and syenite. It occurs in many parts of Europe, and fine crystals are found in southern Norway. In the United States the mineral occurs in Connecticut, New Jersey and Arkansas, and also in the Lake Superior region. It is likewise found in Nova Scotia. Natrolite takes a good polish, and has been used as a gem stone.

NATRON, a carbonate of soda or mineral alkali, $\text{Na}_2\text{CO}_3 \cdot 10\text{H}_2\text{O}$. It is produced from the ashes of several species of marine plants and is also obtained by evaporating the waters from some mineral springs. It is also found as an efflorescence in the ground. It occurs in nature, but only in solution, and is generally found in an impure state, being mixed with other sodium salts, such as the sulphate and chloride. The soda lakes of Egypt have supplied great quantities of this substance for many centuries; it was used by the ancient Egyptians as an important ingredient in their embalming fluids. A similar but impure hydrogen sodium carbonate is found deposited by evaporation on the shores of the Caspian and Black seas, also on the banks of alkali lakes and springs in California, particularly in the neighborhood of San Bernardino.

NATTER, **Heinrich**, Austrian sculptor: b. Graun, Tyrol, 16 March 1846; d. Vienna, 13 April 1892. He was five years apprentice to a sculptor in Meran and subsequently was taught drawing at Augsburg by Johann Geyer, a famous painter of humorous genre. Subsequently he studied with great profit under Max Widmann (q.v.), the sculptor, in the Munich Academy. Weak health compelled him to travel and he visited Riva on Lago de Garda and Venice, until the war of 1866 called him to active military service. He afterward took up his residence at Munich, where he made his reputation by his portrait busts, sepulchral statues, a colossal statue of the god 'Odin' (1873) and the head of a 'Sleeping Satyr.' A career of wider activity opened for him after his settlement in Vienna, where, besides numerous bust portraits and monuments, he executed the statue of Zwingli for Zürich; the statue of Haydn for Vienna; the portrait statue of Laube and Dingelstedt for the municipal theatre of that city; and the statue of Walter von der Vogelweide for Bolzano (1889). His statue of Andreas Hofer, which is his masterpiece, was unveiled after the sculptor's death on a height near Innsbruck. A poetic delicacy of conception and a certain life-like expression, oftener found in painting than in sculpture, are the characteristic features of his work. His literary remains were published by L. Speidel, under the title 'Kleine Schriften' (1893).

NATTERJACK, an Old World toad (*Bufo calamita*), light-brown in color, spotted with patches of a darker hue. It does not leap or crawl like the common toad, but rather runs, whence it has the name of walking or running toad. It has a deep and hollow voice

audible at a great distance, and is often found in dry situations.

NATTIER, ná'tyā, Jean Marc, French portrait painter: b. Paris, France, March 17, 1685; d. there, Sept. 7, 1766. The son of a portrait painter, he probably studied under Jean Jouvenet and won first prize at the French Academy at the age of 15. During the course of Peter the Great's European travels, Nattier was summoned by him to Antwerp in 1715 to paint his portrait, his wife Catherine I, and prominent members of his entourage. Nattier's *Petrification of Phineus and His Companions* led to his election to the Academy in 1718. He turned from mythological and historical subjects to portrait painting and soon became one of the most fashionable portraitists of his time. He received numerous royal commissions from Louis XV to paint the ladies of his court, including Marie Leszcynska and Madame de Pompadour.

His graceful, elegant portraits were characteristic of the period. Elegance and tact overcame faithful characterization in them. He usually treated his subjects as mythological themes portrayed in soft, rounded lines and light colors, especially a bright blue. Nattier is well represented in European museums and his portrait of the *Princesse de Condé as Diana* is at the Metropolitan Museum of Art in New York City.

NATTY BUMPPO, hūmp'ō, the central character in James Fenimore Cooper's *Leatherstocking Tales* (q.v.).

NATU LA (NATHU LA), nā'tōō lā, Himalayan pass, Sikkim, Protectorate of India, on the Sikkim-Tibet border, at an altitude of about 14,000 feet, 15 miles northeast of Gangtok. This much-traveled pass is on the main road which leads from Sikkim into the Chumbi Valley, Tibet, and connects with the main India-Tibet trade route. When snow closes the Jelep La six miles southeast, Natu La often is used as an alternative.

NATURAL BRIDGE, village, New York, in Jefferson County, eight miles northeast of Carthage. This tourist resort has a natural bridge and caverns carved out of limestone by the Indian River. The caverns extend about 1,000 feet underground. Pop. (1950) 600.

NATURAL BRIDGE, village, Virginia, in Rockbridge County, 16 miles south of Lexington, near the James River, at the entrance to Jefferson National Forest. A famous natural bridge over Cedar Creek, one of the natural wonders of America, is located just west of the village. This limestone arch is about 215 feet high, 50 to 100 feet wide, and has a span of about 90 feet. It was once part of a cave roof or the roof of an underground tunnel through which the creek flowed. Thomas Jefferson owned the bridge at one time and a public highway now passes over it. There also are magnesia and lithia springs and a saltpeter cave in the village. Pop. (1950) 950.

NATURAL BRIDGES NATIONAL MONUMENT, Utah, in the southeastern part of the state, San Juan County, about 30 miles west of Blanding, with an area of 2,649.7 acres. It consists of three natural bridges, spectacularly carved out of sandstone by erosion. The bridges cross canyons as much as 2,500 feet deep in a

6,000-foot high plateau. Sipapu Bridge, the largest, is 222 feet high with a span of 261 feet. Its name, taken from Hopi legends, refers to the gateway through which men's souls emerge from the underworld and finally return to it. Kachina Bridge is next in size with a height of 205 feet and a span of 186 feet. Its name is a Hopi word for "sacred dance" and it was chosen because Hopi dance symbols were found carved on the bridge. Owachomo (Hopi "flatrock mound") is 108 feet high, has a span of 194 feet, and is considered to be the oldest (at least 10 million years old). The colors of the bridges range from salmon pink to deep violet.

Cliff dwellers originally inhabited the area and a series of their dwellings and caves remain in the canyon walls. Ute and Paiute Indians displaced them at least 500 years ago. The first known white visitor was a man called Cass Hite who explored the region in the 1880's. In 1908 they were set aside as a national monument.

NATURAL GAS. See GAS, NATURAL; MINERAL PRODUCTION OF THE UNITED STATES.

NATURAL HISTORY, American Museum of. See AMERICAN MUSEUM OF NATURAL HISTORY.

NATURAL HISTORY, in its widest sense, that department of knowledge which comprehends the sciences of zoology and botany, chemistry, natural philosophy or physics, geology, palaeontology and mineralogy. It is now, however, commonly used to denote collectively the sciences of botany and zoology, or these together with geology, mineralogy and palaeontology, exclusive of physics and chemistry, and it is sometimes restricted to denote the science of zoology alone.

NATURAL HISTORY OF SELBORNE, *The*, a celebrated work by Gilbert White (q.v.), published in 1789. Its material consists of White's letters to Daines Barrington and Thomas Pennant, in which the writer describes outdoor life in the little Hampshire village which his works made famous and interesting alike to students of nature and to lovers of good books, among which the *Natural History* ranks as a classic of science and of letters.

NATURAL LAW. For more than two millennia the idea of natural law or the law of nature has played a prominent part in philosophical thought and political theory. It has been applied in each field as a criterion of contemporary ideas and institutions and thus has served to justify either conservatism or change. However, since the words *nature* and *natural* have many meanings, the modern attempt to extend a consideration of natural law beyond ethics and politics to natural sciences has created ambiguities and has caused the doctrine of the law of nature to be challenged by materialists since the mid-18th century.

Although there has been much difference of opinion about the contents of the law of nature, yet almost all admit the existence of such a law. Many definitions of natural law have been given by Greek philosophers, Roman jurists, patristic theologians, medieval scholastics, and modern savants. But generally, throughout most of mankind's western history, the notion of natural law has been conceived as the ultimate norm of right

and wrong, as the ideal pattern of the life according to Nature, as the law discernible to reason and distinct from what positive law has been contained in codes established by the state or the church.

Probably the most influential description of natural law is that formulated by the Eastern Roman Emperor Justinian the Great in 533 A.D. when in his *Institutiones* (I.2.11), he declares: "The laws of nature, which are observed equally among all nations, established—as it were—by divine providence, remain ever firm and immutable." Perhaps the best definition of natural law is that furnished by St. Thomas Aquinas in 1269 when in his *Summa Theologica* (I-II.91.2) he writes: "The function of the natural law" is to "discern what is good and what is evil. . . . The natural law is nothing else than the rational creature's participation of the eternal law."

If we combine the above description and definition, we can consider that natural law is (1) that part of morality which provides universal rules for governing man's external acts; (2) the code dictated by conscience. It is not a law deduced from human education and experience, but a law regulating man's general rights and duties in relation to God's or Nature's moral government and man's moral capacity and accountability. From these considerations we find that the law of nature has three characteristics: (1) universality, because its precepts are always the same in all times and among all peoples; (2) necessity, because it is a demand upon man's rational nature; (3) immutability, because it is independent of all human authority.

The conception of natural law appears early among historical conceptions of justice. The opinions of Marcus Tullius Cicero (106–43 B.C.) perhaps have had the most influence of several opinions current before the Christian era. Influenced by Greek Stoicism, Cicero repeatedly and eloquently exalts the natural law which he calls "the supreme law, which was born in all the ages before any law had been written or any state had been established" (*De Legibus*, I.6.19). He claims that "True law is right reason in agreement with nature; it is universal, unchanging, everlasting; it summons to duty by its commands; it averts from injury by its prohibitions" (*De Republica*, III.22.33.). But Roman jurists eventually identified the characteristic concept of natural law (*jus naturale*) with the law of nations (*jus gentium*), a system of positive law which incorporates principles found in the laws of all nations, which points to a similarity in the ideas of all peoples, and which is common to the whole human race (Justinian, *Institutiones*, I.2.2).

During the Middle Ages natural law was conceived mostly in its humanistic aspect, that is, in its application to particular conditions. Because of the dominant religious trend of those troubled times, the law of nature was identified with the law of God. Gratian, the codifier of canon law (*jus canonicum*), considered natural law as what is contained in the Law and the Gospel whereby everyone is commanded to do to another what he wishes to be done to himself, and is forbidden to inflict upon another what he does not wish to be done to himself. In other words, natural law became identified with the so-called golden rule of Matthew 7:12 and Luke 6:31 (*Concordantia Discordantium Canonum*, I. D. 1, praef.).

After the Protestant Reformation the theories and doctrines of natural law were prominent in

discussions both on international law (*jus inter gentes*) and on general jurisprudence. International law was, in fact, built on natural law by Hugo Grotius (1583–1645) who held that human laws can establish nothing contrary to nature (*De Jure Belli et Pacis*, II.3.6). In general jurisprudence, Sir William Blackstone (1723–1780) maintained that no human laws are valid if they are contrary to the law of nature and that such of them as are valid derive all their force and all their authority from the natural law (*Commentaries on the Laws of England*, intro., sect. 2, p. 41). In politics and in political economy the liberal rationalists of the 17th and 18th centuries, notably John Locke and Jean Jacques Rousseau, adopted natural law to assert man's claim to the natural rights of life, liberty, and the pursuit of happiness. These natural rights are recognized in the American Declaration of Independence (1776) and in the French Declaration of the Rights of Man and of the Citizen (1789), both instruments born of political revolution.

Despite the attacks of totalitarian foes, the concept of natural law has survived into the 20th century to reassert mankind's natural rights—notably in the Universal Declaration of Human Rights (1948) promulgated by the General Assembly of the United Nations.

NATURAL RESOURCES. See individual countries.

NATURAL RIGHTS. See NATURAL LAW.

NATURAL SELECTION, the theory proposed by Charles R. Darwin and Alfred Russel Wallace in 1858 to explain the vast diversification of species in the plant and animal kingdoms, with their multitudes of distinct types adjusted to meet almost every possibility of self-maintenance in the variety of conditions set by the external world. Natural selection bears upon the phenomena of evolution in general. The facts in nature from which the theory of natural selection is argued are the great diversity of individual organisms; the heritability of variant characters; the enormous overproduction of plant spores and seeds and of animal eggs and young; and the consequently inevitable "struggle for existence." Parallel to the artificial selection of variants by man in breeding domestic animals, it is inferred that there is a natural selection in nature favoring advantageous variants and tending to eliminate disadvantageous ones. Modern interpretation emphasizes selection of groups rather than selection at the individual level. Progressive divergence of plant and animal populations is regarded as arising from the greater breeding potential of members of each generation that vary

in the direction of better adjustment to their environment—to some particular feature of it, to environmental changes, or to newly-invaded, different environments. Less favorable variations have a correspondingly lessened probability of survival, and accordingly are progressively eliminated. Adaptation is, therefore, the basis for selection. Continuous structural modifications, in line with a constantly changing environment, lead to the origin of new species. Darwin also stressed sexual selection, which is a factor in developing courtship adornments of animals and other sex differences.

Improved adjustment to the environment may be physiological, anatomical, or behavioral. It may consist of improvements in internal physiology—capacity to digest special foods, greater resistance to heat or cold, or improved internal controls of body functions (homeostasis). Adaptation also may involve varied mechanical adjustments of body parts to opportunities offered by the environment such as locomotion above or below the ground, in trees, or in the air. Special habits of food getting, mating, and reproduction, or self-defense likewise may cause similar adaptations. It is very striking that improved or changed adjustments may lie wholly in changes of behavior, without discernible changes of structure. A good example is found in the nest-building instincts of animals, which are inherited just as are their color, form, and physiological changes.

One of the principal objections to the theory of natural selection is that the incipient variation would be of too little advantage to be favored. This does not seem to be the case with variations in behaviour. In the development of *acquired* (physical) characters, special behavior sets the stage for preserving any incipient *heritable* variation, either structural or behavioral. This is referred to as the "Baldwin principle" by George G. Simpson (1953) and Conrad H. Waddington (1953). Geographic isolation explains another difficulty in establishing the origin of new forms. This factor was underemphasized by Darwin according to Moritz F. Wagner (1868), Ernest Mayr (1942), Warder C. Allee and others (1949). There are many instances in which a character that has become established and distinctive under conditions of isolation is preserved in a distinct species when parent form and derived form are brought together again.

A specific objection formerly was raised against the interpretation that natural selection is the operative factor in producing the slight differences that appear to be adaptive. A good example is wild mice's coat color, which varies and tends to blend with the color of their native terrain. Francis B. Sumner was able to demonstrate by breeding experiments in 1932 that minor differences in the color of the hair of white-footed mice (the most abundant and ubiquitous of North American wild mice) are inherited. Lee R. Dice devised another set of experiments in 1947 to meet the further objection that such color differences and resemblances to soil could not afford effective protection to the mice because they are nocturnal. He used owls as the natural predator and simulated the conditions of terrain and light in laboratory cages. Statistical analysis of the results showed that the differential in the number of mice captured from a natural background, as against one to which their color was not adjusted, was such that rapid evolution by selection would take place.

The effectiveness of natural selection in relation to predation was tested by Sumner in 1935 in an ingenious experiment with small fishes that have the capacity for color change. A considerable number of such fishes were placed in two tanks, one painted black on the inside and the other white. In a few weeks the color of the fish matched their respective tanks. When two small penguins were introduced as typical predators into each tank with an equal number of black and white fishes the penguins ate the fishes voraciously. After the two penguins were removed, three-fourths of the fishes eaten in the black tank were white, whereas in the white tank the majority eaten were black. This differential certainly makes possible effective selection for either background resemblance or for the capacity to adjust to background by color change. Further experiments by Dwight Isely in 1938 with protectively-colored grasshoppers and chickens as predators fully confirm Sumner's results.

The rapid development of insect strains immune to DDT and other insecticides (Henry J. Quayle, 1943) and rusts capable of attacking rust-resistant strains of wheat and other cereal grains (Helen Hart, 1944) indicate a *selection pressure* affecting all organisms in their flow from generation to generation.

Paleontologists, ecologists, and geneticists have contributed to the interpretation of the natural selection theory. The fact that cooperation may be a characteristic of "survival value" throws much light on the evolution of societies and on the evolution of man, according to authors Julian S. Huxley (1942), George G. Simpson (1944, 1949, 1953), Warder C. Allee and others (1949). See *EVOLUTION, ORGANIC*; *DARWINIAN THEORY*; *GENETICS*; and *HEREDITY*.

NATURAL TONES are tones produced by the natural alteration of nodal points in wind instruments by pressure only. See also **HARMONICS**.

NATURALISM, in the fine arts, is a representation of nature closely approximating its appearance, but without either photographic fidelity or attempt at illusion. Opposed to *idealism* and implying less crudeness than *realism* naturalism is the mean between the two.

In literature, naturalism is a style of fiction writing which aims at scientific objectivity in the portrayal of characters conceived of as motivated primarily by impersonal biological, economic, and social forces. Thus the social environment, rather than individual character, is the driving force affecting plot development. The forerunners of naturalism in France were Stendhal and Balzac. Flaubert, acclaimed a leader of the school, rejected both the terms "naturalism" and "realism" as not applicable to his work. The Goncourts and Alphonse Daudet, usually regarded as of this school, might better be termed impressionistic than naturalistic writers. Émile Zola defined the naturalistic method and is popularly regarded as the exemplar of the type; but the novelist of

that late 19th century epoch best deserving the title is Guy de Maupassant.

• From France naturalism spread to other countries. George Gissing and George Moore were leading British novelists who adopted the method, while in the United States Stephen Crane and Frank Norris were prominent early followers of a movement that soon became worldwide.

NATURALISM. In philosophy, this term stands (1) for a certain type of philosophy in general or (2) for a certain kind of ethical theory. In the former usage naturalism is sometimes defined as a particular way or method of approaching philosophical problems and sometimes as a particular set of conclusions arrived at as answers to these problems. Thus many naturalists describe naturalism, not as a theory of the nature of reality, but as a specific temper of mind, namely, a confidence in the empirical, experimental, or scientific method as the only reliable method of reaching the truth about man and the world, or of guiding action; and a rejection of faith, revelation, authority, tradition, a priori reasoning, and intuition as sources of truth or guidance. For it all meaning originates in experience, and all beliefs must be tested by experience in accordance with the general canons of scientific method. In this sense, then, naturalism is roughly equivalent to empiricism.

On other occasions naturalism is described primarily as consisting of certain philosophical conclusions which are opposed in general to the characteristic doctrines of religion, supernaturalism, and idealism. The main tenets thus ascribed to naturalism are the following. (a) Every state of the world or event in it can be explained causally or mechanically by reference to previous states or events, or else is the result of chance. Teleological or purposive explanations are not necessary or even possible, and no cosmic purpose is involved in the world process. (b) No God or other supernatural being or kind of entity (such as Plato's Ideas) is required to explain the world, and, indeed, no such beings exist at all. The natural world of objects and events in space and time is all that is real, and it is self-existent and self-explanatory or else is simply inexplicable. (c) Man is wholly a part of this natural world in space and time, both as to body and mind and as to origin and destiny. No element of his being is immortal, and he is only an incidental product of the world process, whether considered as an individual or as a species. (d) There are no absolute values or transcendental norms, known to us in non-empirical ways. All values and norms are in some sense a function of human attitudes, interests, needs, satisfactions, individual or social, or at least of natural processes and regularities. They have no support of a supernatural, nonnatural, or cosmic nature, even if they have some sort of universal validity.

It is not clear that all of these doctrines are essential to naturalism. For example, Bertrand Russell's essay *A Free Man's Worship* expresses a naturalistic view of the world, and yet he was at that time an absolutist in ethics. But at any rate, these doctrines are typical of naturalism.

The relation of naturalism (in the sense of a set of conclusions) to monism, materialism, and determinism requires comment. Naturalism is often represented as denying any dualism of mind and matter and as affirming some monistic view of their nature, and in general this is true. But,

again, Russell in *Mysticism and Logic* was a naturalist and a dualist, so that monism hardly seems essential. More specifically, naturalism is frequently identified with materialism, both by opponents and by proponents. And indeed, materialists are usually naturalists, for example, Democritus and Roy Wood Sellars (though not always, for example, the Stoics). But the reverse cannot be said to be true, since many naturalists, like John Dewey and his followers, decline to call themselves materialists. Determinism likewise is said to be a part of naturalism, but there have been naturalists who were not determinists, namely, Epicurus, Lucretius, and Dewey. Naturalists commonly do hold that nature is a realm of causal law, but it is not necessary for them to do so. They may, for instance, be indeterminists in their interpretation of quantum mechanics.

We may, then, describe naturalism either as a certain view about method or as a certain set of conclusions. We should, however, not regard a man who holds this view about method as a naturalist unless he also holds this set of conclusions; nor should we call a man who holds these conclusions a naturalist unless he has arrived at them by this method. The point seems to be that, whether there is a strict logical connection between the method and the conclusions or not, in practice naturalism is a combination of the two. The naturalist adopts and generalizes the scientific approach, and following this scientific method he feels forced to accept the conclusions indicated.

In a narrower sense, the term "naturalism" is used in 20th century ethical discussions for a certain kind of ethical theory. This use of the term is due to George Edward Moore. Here "naturalism" stands for the view that ethical concepts or properties can be defined in terms of nonethical concepts or properties of the sort that appear in empirical or scientific judgments of fact. For example, if one holds that "good" means "desired" or "satisfying," or that "right" means "dictated by society" or "conducive to the general happiness," and that similar definitions can be given for all other ethical terms, then he is a naturalist in this sense. It follows on such a view that moral and other value judgments are true or false and can be established by empirical observation—in fact, ethics becomes a branch of some empirical science like psychology or sociology.

It is obvious that a naturalist in the more general sense will often be a naturalist in this narrower sense when he comes to deal with ethics and values. But one may be an ethical naturalist without being a naturalist in one's general philosophical position; one may believe, for example, that all ethical terms can be defined by reference to desire and satisfaction, and yet be a supernaturalist. One may also, however, be a naturalist in the wider sense without being an ethical naturalist, if one holds, as some do, that value judgments are not assertions which are true or false but expressions of emotion, attitude, and so forth.

WILLIAM K. FRANKENA,
Professor of Philosophy, University of Michigan.

NATURALIZATION, any process by which a state confers its nationality or its citizenship upon a person after birth. Persons acquire the original nationality of the state in whose territory they are born (*jus soli*), or the state of the

parents' nationality (*jus sanguinis*), or both, according to the law of the respective states. This original nationality may change by a transfer of territory, which normally changes the nationality of permanent residents who had the nationality of the transferring state; by marriage to an alien, which under the law of some states changes the nationality of the wife; by special legislative grant of nationality to an individual or a group; or by emigration and voluntary acceptance of the nationality of the state of immigration in accordance with its laws.

While all these modes of transfer of nationality constitute naturalization in the broad sense, the term is often applied in a narrower sense only to the last method. Nearly all states now have general laws declaring the conditions under which individual naturalization may be effected. Qualifications in respect to length of residence, age of the applicant, and moral character are usually prescribed, and qualifications as to literacy, wealth, health, beliefs, culture, and race must sometimes be complied with. Naturalization is often treated as an executive process, sometimes as a legislative or judicial process. Formal application (first papers) usually has to be made some time before naturalization (second papers) is finally granted. Sometimes the latter is celebrated by a formal ceremony involving the taking of an oath of allegiance. In the interval between formal application and the final grant, the applicant sometimes has to submit to certain tests and investigations to make sure that he conforms to the requirements of the law.

Limitations of International Law upon Naturalization.—Nationality, as a legal status, is to be distinguished from citizenship (q.v.). The latter is a status under the law of a state which confers certain legal advantages and imposes certain obligations upon the individual. Nationality, on the other hand, is a status under international law giving a state the right to legislate for and protect its nationals, even in foreign countries. While, in general, nationality is derived from citizenship and both from the law of the state, international law imposes certain general limitations upon the capacity of the state to confer nationality and treaties may impose special limitations. (Tunis Nationality Decrees, P.C.I.J., Ad. Op. No. 4; Acquisition of Polish Nationality, P.C.I.J., Ad. Op. No. 7, World Court Reports, vol. 1, pp. 156, 245.) International law may also consider a person a national of a state even though that state had not conferred citizenship upon him. Thus, in the United States, Indians in the tribal condition and the native inhabitants of the insular possessions were originally nationals of the United States but not citizens; however, special legislation since 1924 has conferred citizenship upon the Indians and upon persons born in the islands since their acquisition by the United States.

While international law permits a state to impose nationality at birth upon individuals according to the law of the soil (*jus soli*), or the law of the blood (*jus sanguinis*), or both, it does not in general permit a state to naturalize persons without their consent. (*Mackenzie v. Hare*, 239 U.S. 299.) Thus, efforts of a state to escape international responsibility for injuries to resident aliens by passing laws (so-called Calvo clauses) declaring that such persons who acquire land or concessions are to be regarded as its nationals in respect to such interests have been

held invalid by arbitral tribunals. (*North American Dredging Co. v. Mexico*, U.S.-Mexico Claims Commission, Opinions, 1927, p. 21.)

International practice has permitted the imposition of nationality upon wives and minor children of men who naturalize, but the modern tendency has been to permit a married woman to retain her original nationality. The inconvenience which often follows from the division of the family on nationality lines has induced some states to create a presumption that all members of the family have the nationality of the husband and father, to be overruled only by express declaration of an intention to retain the original nationality.

In transfers of territory, the practice permitting imposition of the new nationality upon permanent residents of the territory who have the transferring state's nationality has often been mitigated by treaties giving such persons the option to retain their original nationality by declaration within a stated period of time. (*Schwartzkopf v. Uhl*, 1943, 137 F. 2d 898.) In the treaty of peace between the United States and Spain in 1898, this option was given to natives of Spain resident in the ceded islands, but not to natives of the islands. The United States treaties acquiring California (1848) and Alaska (1867) included similar provisions, but no such option was permitted in the treaties for the annexation of Louisiana (1803) and Florida (1819). Treaties ending the world wars of the 20th century have generally given the inhabitants of transferred territory an option to retain their original nationality by suitable declaration, at least if they spoke the language of the ceding state.

In individual naturalization, international law requires that it be a voluntary act of the applicant, open only to persons clearly connected with the naturalizing state by permanent residence or service in a civil or military capacity. In the absence of such conditions, the state of alleged naturalization cannot protect the individual against another state. (*Nottebohm case, Liechtenstein v. Guatemala*, I.C.J., 1955.)

Dual Nationality and Statelessness.—Although international law imposes limitations upon the capacity of states to make naturalization laws, yet within these limitations states have wide discretion, and a difference in the laws of states may create conditions of dual or multiple nationality or of statelessness. Efforts have been made to develop international law by treaties to avoid such conditions. The Conference for the Codification of International Law, called by the League of Nations in 1930, drew up three conventions at its session at The Hague, based upon its conviction "that it is in the general interest of the international community to secure that all its members should recognize that every person should have a nationality and should have one nationality only."

Dual or multiple nationality may exist at birth when a person acquires the nationality of one state by the *jus soli* and of other states by the *jus sanguinis*, which is sometimes applicable both to the father and the mother if they have different nationalities. One of the Hague conventions of 1930 sought to avoid this by permitting the individual to choose, and by requiring third states to recognize that he had only the nationality of the state with which he was most closely connected.

A person may be born stateless if the state in whose territory he was born applies only the *jus sanguinis* and the state of his parents' nationality applies only the *jus soli*. To avoid this, one of the Hague conventions provided that states accord their nationality to persons born in their territory who would not otherwise acquire any nationality, provided the mother was a national.

Dual nationality may also arise from the refusal of the state of origin to recognize naturalization as effecting expatriation. The common law maintained the principle of permanent allegiance, and Great Britain's refusal to recognize the naturalization of British subjects in the United States was a contributing factor to the War of 1812. Strangely, while the United States was insisting through its diplomats that naturalized persons had expatriated themselves and could not be impressed into the British naval service, American courts continued to support the common law doctrine of permanent allegiance until 1868, when Congress declared that "the right of expatriation is a natural and inherent right of all people," that any order or decision of any officer of the United States to the contrary was invalid, and that "all naturalized citizens of the United States while in foreign countries are entitled to and shall receive from the government the same protection of person and property which is accorded to native born citizens." The United States has made a number of treaties since that time providing for expatriation by naturalization. Great Britain abandoned the principle of permanent allegiance, by statute, in 1870.

Married women may have dual nationality or be stateless because of a conflict of laws concerning the effect of marriage to an alien or the naturalization of the husband upon the nationality of the wife. If the law of the husband's state recognizes the unity of the family under his nationality and that of the wife's state recognizes individual nationality, the wife will have dual nationality. But if the situation is reversed, the wife will be stateless. One of the Hague conventions provided that the wife shall not lose nationality by marriage to an alien or by the naturalization of her husband unless she acquires his nationality, and the naturalization of the husband shall not change the wife's nationality without her consent.

NATURALIZATION LAWS

Although nationality is a fundamental relationship in both international and national law, national laws governing the matter vary greatly among states and in most modern states have been subject to frequent and radical changes. The general character of naturalization laws depends in considerable measure on the country's situation regarding immigration and emigration. Young, sparsely populated, and rapidly developing countries, such as those of the Americas, have generally welcomed immigration and have consequently provided by law for easy naturalization, resulting in loss of previous allegiance. Old, more densely populated, and less rapidly developing countries, such as those of Europe, have had little immigration and have often sought to discourage emigration, to make naturalization difficult, and to recognize expatriation only if the government consents. Countries generally tend to take this position in time of war.

The United States shifted its position after

World War I from one of welcoming immigration and naturalization to one of imposing rigorous restraints on economic, cultural, and political grounds. Restrictions based on national origin, literacy, health, moral character, and ideology have created serious obstacles to immigration and naturalization. On the other hand, the human rights movement, which demands equality for women, equality of races and economic opportunity, and freedom of movement, has tended toward the elimination of arbitrary racial and other discriminations, and toward the relaxation of restrictions in favor of refugees. These diverse pressures have led to numerous special laws and regulations in the field of immigration and naturalization, especially in the period after World War II. The same factors have been operative, though in less degree, in other countries, and naturalization laws have become increasingly fluid.

United States.—The Constitution authorizes Congress "to establish a uniform rule of naturalization" (Article I, section 8, clause 4), and an act of 1790 provided that the children of citizens of the United States born abroad should be considered "natural born citizens" provided the father had been at some time resident in the United States. An act of 1855 eliminated the term "natural born" and made it clear that nationality could be conferred *jure sanguinis* only by the father. The act of 1790 also provided for the naturalization of "free white persons" who had resided in the United States for at least two years. This period was raised to five years in 1795, to 14 years by the notorious alien acts of 1798, and restored to five years by an act of 1802, which also provided for the automatic naturalization of minor children upon the naturalization of the father.

After the Civil War, an act of 1870 extended the naturalization act to "aliens of African nativity and to persons of African descent." An act of 1882 forbade the naturalization of Chinese. A series of judicial decisions held that Chinese (before the act of 1882), Japanese, Hindus, Afghans, Filipinos, Koreans, and Hawaiians were not "white persons," but that Syrians, Armenians, and Mexicans (even though largely of Indian blood) were. Thus Asiatics east of Persia could not naturalize and, as immigration was made contingent upon capacity to naturalize, could not migrate to the United States. These discriminations were eliminated with respect to the Chinese by an act of 1940 and the treaty of 1943 with China. The McCarran-Walter Act of June 27, 1952, eliminated explicit Asiatic discriminations, putting all Asiatics and Africans on the national origins quota first introduced for Europeans by the act of 1924. In accordance with this principle, the total permitted immigration (154,000 a year as of 1955) is apportioned among all countries in proportion to the estimated contribution of that country to the American population as it was in 1920. Asiatics and Africans are limited to a quota of 100 from each country. Eastern Europeans have very small quotas, while the British, Irish, Germans, and Scandinavians have the largest.

The act of 1855 provided for the first time that women eligible for naturalization became citizens automatically on marriage to a citizen. This was repeated in the law of 1907, with the addition that an American woman would lose her nationality on marrying a foreigner but could

resume citizenship at the termination of the marital status if she registered in an American consulate or returned to the United States.

The 14th Amendment, which went into force in 1868, gave constitutional validity to a principle which had been accepted in a law of 1866, by providing that "All persons born or naturalized in the United States, and subject to the jurisdiction thereof [thus excluding tribal Indians, children of foreign ambassadors, and natives of unincorporated territories of the United States], are citizens of the United States and the State wherein they reside." Previously, citizenship had been primarily a state matter, federal citizenship being a derivative. It was held that even Chinese and other persons ineligible to naturalization were citizens if born in the United States. (*United States v. Wong Kim Ark*, 1898, 169 U.S. 649.)

The act of 1868, already noted, provided for expatriation upon naturalization and the act of 1907 created a presumption of expatriation of naturalized citizens who resided for two years in the country of origin or five years in any other country without registering at a United States consulate.

Comprehensive regulations for naturalization were provided for the first time by an act of 1906. It gave federal district courts and state courts of record jurisdiction in naturalization; established a Bureau of Immigration and Naturalization, changed in 1933 to the Immigration and Naturalization Service in the Department of Labor; and provided in detail for naturalization procedures. Five years' residence was required and a declaration of intention (first papers) had to be made at least two years before final naturalization. As amended in 1918 and 1926, this law provided that persons who had served in the United States armed services were excused from the residence requirement; and enemy aliens, deserters, anarchists, polygamists, persons not of good moral character, and persons not attached to the principles of the Constitution were excluded. Conscientious objectors were held to be in the latter category in the cases of *Mme. Rosika Schwimmer*, a Hungarian pacifist (*United States v. Schwimmer*, 1929, 279 U.S. 644, 652), and Professor McIntosh, a Canadian conscientious objector in the Yale Divinity School (*United States v. McIntosh*, 1931, 283 U.S. 605, 626).

The Cable Act of 1922 modified the act of 1907 by providing for individual naturalization of women married to citizens, with a reduction of the residence requirement, and for retention of citizenship by American women marrying foreigners in the absence of an express renunciation of citizenship. An act of 1934 further equalized the status of men and women by permitting acquisition of nationality *jure sanguinis* through the mother as well as the father, and permitting a reduction of the residence required for the naturalization of an alien marrying an American woman.

An act of 1940 codified the law of nationality, and permitted the naturalization of Chinese, Indians, and Filipinos. By the Alien Registration Act of 1940, all aliens living in the United States for 30 days or more were required to be registered and fingerprinted. Over 5 million registered during the next year. The Internal Security Act of 1950 required the annual reporting of all alien residents. Some 2 million reported

in 1951, of which two thirds were Mexicans (324,000), Italians (229,000), Canadians (217,000), Poles (213,000), British (193,000), Russians (126,000), and Germans (118,000).

The entire field of immigration and nationality was again codified by the McCarran-Walter Act of 1952, passed over President Harry S. Truman's veto. It occupies 118 pages in the statutes and repeals 48 acts previously in force on the subject. The act made all Asiatics eligible for naturalization and immigration, extended the quota system to Asian countries, gave a preference to immigrants with special skills and with family connections in the United States, and introduced new qualifications for immigration and naturalization designed to exclude the ill, indigent, illiterate, immoral, and seditious, including Communists. The design was to facilitate the rapid naturalization of aliens lawfully in the United States. Declarations of intention two years before naturalization were no longer required and naturalization could be effected 30 days after petition and rigorous examination. The act also provided for cancellation of naturalization by discovery of fraud, by seditious behavior, or by prolonged residence abroad. The administration of the law was entrusted to the attorney general and the secretary of state.

The number of annual naturalizations has varied greatly. It reached a peak of 442,000 in 1944 and a low point of 55,000 in 1951, rising to 118,000 in 1954. Of this number, about two thirds originated in nine countries: Great Britain (16,565), Canada (13,062), Germany (11,679), Italy (10,926), Poland (8,342), Japan (6,750), Ireland (5,324), Soviet Union (3,832), Mexico (3,710). The large number of Japanese reflects their eligibility resulting from the act of 1952.

Great Britain and the Commonwealth.

The British Nationality and Status of Aliens Act of 1914 repealed earlier legislation and for the first time dealt with the subject comprehensively. It defined natural born British subjects as including "any person born within His Majesty's Dominions and allegiance" or born in a British ship even in a foreign port, and "any person born out of His Majesty's Dominions whose father was at the time of that person's birth a British subject." The secretary of state was authorized to grant certificates of naturalization to aliens who had resided in British territory for five years or had served the crown for that length of time, provided they were of good character, had "an adequate knowledge of the English language," intended to continue British residence or service, and took an oath of allegiance. The act also provided for revocation of naturalization obtained by false representation or in case evidence emerged of trading with an enemy, of continued allegiance to an enemy, of serious crime within five years of naturalization, of bad character at the date of naturalization, or of seven years' residence abroad other than in British service or in the service of a British business or institution. The act gave governments of British possessions similar powers to issue certificates of naturalization, provided that, in a self-governing dominion, the legislature had conferred such powers.

This act provided that the wife of a British subject should be deemed a British subject and the wife of an alien should be deemed an alien. An amendment of 1933, however, provided that a woman would not lose British nationality by

marriage to an alien or by the naturalization of her husband unless she acquired her husband's nationality. Provision was also made for a British woman who married an alien to retain British nationality by declaration. Furthermore, the naturalization of an alien would not naturalize his wife unless she consented by declaration.

The Nationality Act of 1948 re-enacted most of the earlier legislation, but provided that "British subjects" should include "citizens" of the United Kingdom and of the scheduled dominions. It also provided for acquisition of United Kingdom "citizenship" by birth and by naturalization.

The British Dominions in general adopted the British legislation of 1914. In principle there is a common allegiance to the crown, and therefore, as provided in the act of 1948, nationals of all British Dominions have a common status of "subjects," which can be acquired by naturalization under authority of any government of the Commonwealth. Prior to this act of 1948, the Dominions might create a local citizenship or nationality not in conformity with the British Nationality Act of 1914 and, therefore, not making the individual a subject of the crown in the general sense.

The Irish Free State, by the Constitution of 1922, provided for the status of "citizen of the Irish Free State," not precisely conforming to the status of British subject. Ireland has subsequently ceased to be a member of the Commonwealth, and India, though it continues to be a member of the Commonwealth, has not, since it achieved independence, considered its nationals subjects of the crown.

Other Countries.—The variety of the laws in effect in other countries can be illustrated by statistics for 71 countries, based upon those prepared for the Harvard Research in International Law in 1929. Nationality at birth is acquired solely by the *jus sanguinis* in 17 countries, including the Soviet Union, Germany, Austria, Hungary, Switzerland, China, Japan, and most of the countries of Eastern Europe; primarily by the *jus soli*, but with limited provision for *jus sanguinis*, in 27 countries, including the United States, Great Britain, the British Dominions, and most Latin American states; by both systems, with primary emphasis on the *jus sanguinis*, in 27 countries, including France, Spain, the Scandinavian countries, Italy, Turkey, and most Western European and Middle Eastern states.

The age required for naturalization varies from 18 to 25 years and the period of residence required from one to ten years, with five years the commonest. Most states provide for a shortening of the period of residence for persons married to a national or employed in the state's military or civil service. Nearly all countries provide for automatic naturalization of minor children on the naturalization of the father.

The naturalized citizen enjoys an equal status with the native born citizen in 10 countries, including Great Britain and Canada. In other countries, the naturalized citizen is under certain disabilities, especially ineligibility for certain offices, as in the United States, or subject to expatriation by prolonged foreign residence. Thirty-seven countries, including the United States, Great Britain, Germany, and Japan, recognize automatic expatriation by naturalization abroad; 24, including France, the Scandinavian countries, and China, require the consent of the country of

origin, in most cases to assure fulfillment of the military service obligation. Seventeen countries regard foreign military or civil service as automatically resulting in expatriation, and 13 recognize such a result conditionally. Twenty-nine countries, including the United States, provide for expatriation by manifestations of disloyalty or bad character; 19, by extended residence abroad.

In the 19th century, nearly all countries provided for the naturalization of alien wives by marriage to a national or by the naturalization of the husband, but since the United States Cable Act of 1922, a large number of countries, including Argentina, Uruguay, and the Soviet Union, have eliminated one or both of these rules. Similarly, in the 19th century most countries provided for the expatriation of women on marriage to an alien or on the naturalization of the husband, but since World War I the United States, Great Britain, the British Dominions, France, Germany, Italy, Japan, the Scandinavian countries, and many others have eliminated this rule.

Naturalization laws have fluctuated between the principles of family solidarity, national solidarity, and individual freedom of choice. While the latter principle has in the main prevailed since World War I, the principle of national solidarity has not disappeared and has even been strengthened in some countries since World War II as a consequence of radical ideological cleavages and the "cold war."

QUINCY WRIGHT.

NATURE STUDY, an educational means of training the mind of the pupil, by direct observation, to a knowledge and love of the common things about him. It attempts to develop the life of the child along the lines of its proper relationship to nature; that is, to mankind and the world about him.

History.—Nature study, as a name, is quite recent, but as an actual fact it is old, in a part of its development at least. Socrates and Aristotle advocated and employed methods in teaching very much like those insisted upon by the modern teacher of nature study. The American Indians, over practically the whole extent of the two continents, had systems of instruction fitted, in the case of each tribe or nation, to its own peculiar condition and racial requirements. Even among the Aztecs, the Mayas and the more cultured races of Mexico, Central America, and the west coast of South America, the system of instruction was essentially the same for the great mass of the people, who were kept very much nearer to nature's heart than they are today. At the beginning of the Christian era the philosophers of the Roman Empire were in the habit of teaching their pupils in the open.

This custom was undoubtedly the survival of a very much earlier and more general custom in which nature teaching must have played a prominent part, if we are to judge from

survivals of this very ancient open air teaching in many southern countries to-day and of real nature study and teaching among such semi-barbaric and semi-civilized races as have developed systems of instruction fitted to their several needs.

The Renaissance brought forth teachers who strenuously advocated more natural methods in teaching, not only languages but all other subjects. Of these men the most prominent, the greatest and most far-seeing was Rousseau, some of whose more advanced ideas are but beginning to be realized to-day. Pestalozzi, Froebel and their followers and the modern kindergarten teachers have all been working closer and closer to the goal of nature study whose principles they have been following, consciously or unconsciously. The revolution in teaching was bound to come with the Renaissance; but it came very slowly. Men were too busy with the new learning to bother themselves about the methods of acquiring it. The thing itself was to them all important. But as the novelty wore off, teachers began to think about ways of teaching. Hundreds of methods were put upon the market, all echoes and re-echoes of one another, with here and there a glimmer of new light. But the light, though not very apparent, was really there, though hidden by many clouds of prejudice, custom, habit, misunderstanding and ignorance. The cry of men like Agassiz, Rousseau, Ollendorf, Pestalozzi, Froebel, Herlitz and the whole school of natural method teachers was to get nearer to nature, to have teaching of languages conform to the natural methods by which a child acquires his mother tongue. While these men were builders, they were necessarily anarchistic, to a very considerable degree. They were bent upon sweeping out of existence the old methods which had failed to accomplish what they were intended to accomplish. They were largely anarchistic in their methods also. Let us teach as the child teaches himself, they said. Let us gather facts and impressions from nature just as we come into contact with her, "any old way," provided we accomplish what we aim at. The result was that practically all these "natural methods" were anything but "natural." They followed no line of development or plan; because nature's methods presented themselves to these natural method teachers as evolutionary.

Just when these unscientific methods of teaching had begun to bring discredit upon their authors and more scientific teachers had begun to protest and to replace the somewhat discredited "nature method" designation with that of direct method, teachers of natural sciences in the public schools discovered that the term was still a good one for their purposes. "Let us get nearer to nature in our teaching," was their cry; and they shouted it as enthusiastically as though it had not been already worn threadbare. Science had just been introduced into the public schools and colleges of the country. The science teachers of the lower grades went through the same experiences as the language teachers in getting nearer to nature. The early teachers, in their protest against the too exact and dry methods of the regular science teachers, protested against any method whatever. If teachers would only get nearer to nature everything would be all right,

they preached, for nature, in her kindness, would take care of them. These educational anarchists were soon, however, replaced by men of larger vision, who saw the possibilities of nature teaching if it were only organized and made to follow scientific principles and taught according to properly worked out plans by means of contact with nature supplemented by well organized laboratories of natural objects. This, however, was not done without protests from the ultra wing of the nature study teachers, who talked about the restraints of the unnatural technical science teaching and pleaded for what they denominated the natural, untrammelled development of the child's faculties from the child's point of view. In this there was a small amount of truth and a large amount of misconception of the true functions of teaching. Their cry was a protest against the dry, formal teaching of the school room; and it served its purpose. It quickened the science teacher into action; and nature study methods entered many a science room, many a laboratory, greatly to the improvement of science teaching, and in fact, of teaching in almost every department of school and college life. Nature study was applied to literature, and literature to nature study. The pupil was taught to see the beauties and laws of nature at work in the truest of nature poems, and these poems were read, by nature teachers, as supplementary to their regular studies. This evolution shows two distinct phases, which have been indirectly indicated,—the tearing away from the old methods of teaching; and later on, the building of the new nature study structure scientifically upon the bases of the old.

Modern Development.—Nature study made its appearance as such in the latter quarter of the 19th century; and it was due, as has already been said, to the introduction of the teaching of science and vocational studies into the public schools. The common school teacher, finding it difficult to teach pupils science in the orthodox college manner, had recourse to the practice of using concrete examples and of making use of nature herself for the explanation of her moods and phases. This practice gradually grew until, in 1889, considerable attention became fixed upon it owing to the fight made by numerous teachers of elementary science in behalf of more interesting methods of presenting it to younger pupils. In this latter year W. S. Jackman planned a general course in nature study for the ward schools of Pittsburgh, which he was destined to carry out in Cook County Normal School, to which he went in the fall of the same year. Two years later his notes were published for the use of teachers and schools under the name of "Nature Studies for Common Schools." They were much along the lines laid down several years before by Sheldon in the State Normal School at Oswego, N. Y. This movement in 1889 was noticeable in various educational centres in the Eastern States, notably in Massachusetts. In the latter State A. C. Boyden took the lead and for 10 years lectured and gave model lessons in educational institutions all over the State on nature study. He succeeded in creating a great deal of interest in the subject and in establishing centres of nature study with committees or societies, which met frequently. His methods of using printed outlines and illustrating les-

sons was pretty generally followed; and it was not long before it was improved upon. A special committee on nature study, meeting monthly in Boston, helped to direct the work by arranging courses of study and doing other important services for the cause. These prepared courses were distributed all over the State, and they helped to greatly increase the interest in nature study and to extend its field of influence.

Materials of Study and Organization.—In the early stages of nature study there was little attempt at the scientific organization of the materials used in teaching. As we have seen, outlines of study were formed for the guidance of teachers in their work; but they were largely suggestive and had little of the scientific about them. But gradually, as the practice of nature spread, extending to the high schools and colleges, trained teachers of science applied their methods of organization to it; and nature study gradually took form and shape as a scientific study, in which the proper relationship between the pupil, the teacher and the materials and objects used in teaching were specified and defined. This called into being large and well-appointed nature study laboratories and took possession of vacant or available used pieces of land for experimental purposes in the growing and observation of plants of many kinds by the pupils under the direction of teachers. It made use of excursions into the woods, fishing, hunting and boating trips and camping out parties. Soon a corps of trained nature study teachers sprang into being; and these, in their turn, as a result of experience gained in their work, proceeded to further organize the subjects, activities and province of nature study. The laboratory teacher, from his inside experiments, helped the work of the nature study teacher doing his work on the outside. Now there is scarcely a summer camping school that does not have its nature study director. The pupils are encouraged to form laboratories or museums of their own made during their nature studies. The school laboratories for nature study contain mounted insects, birds, animals, preserved plants, parts of trees, shrubs, plants, in fact samples of everything pertaining to nature in which the child may be made to take a natural interest. These are supplemented by geological and other specimens, models of a large number of objects of different kinds, drawings, photos, pictures, paintings, plans, designs and castings. These are again supplemented, in the larger towns and cities, by visits to art and other museums, great libraries, factories and other industrial plants, zoological gardens, parks, agricultural farms, truck gardens, hot houses, and in fact any and all places of human activities in which the pupils might be interested.

These and numerous other means of direct contact with nature and human activities and their results in manufactured forms are correlated with art study. The pupils are taught to draw, paint or color, photograph, model and represent in various ways the objects with which they come into contact during their nature study classes. Many schools make a permanent exhibition of this work; and some of these exhibits show very encouraging results, with some really beautiful and talented

work. This correlated art work can, and often is made very extensive, including, for instance, the artistic arrangement of flowers, flower beds, borders, etc., the selecting of flowers and their arrangement in gardens so as to secure the blending of colors, observation of the habits of wild and domestic animals and the study of the lives of reptiles, fishes, and, in fact of all kinds of animal life. In other words, nature study is made to lead up directly to the scientific studies of the class-room. See KINDERGARTEN; FROEBEL; ROUSSEAU; PESTALOZZI.

NATURE WORSHIP. The worship of the heavens, the planets, the elements, the manifestation of all forms of life, vegetable and animal, including the personified life attributed to inanimate objects. Nature worship, though probably everywhere occasioned by the natural impulse of man to fear the terrific manifestations of nature and to show great respect for the powerful and the mysterious, has taken many different by-paths in the development of the various human races and families. The early investigators into the phenomena of natural religions failed to recognize this diversity of development, and they proceeded to build universal theories on divergent growths. Hence all of their theories have either partially or completely fallen by the wayside, or have survived the test of time only as a diminutive part of the original whole. Yet the work of the early investigator has not been done in vain; for, inasmuch as he has thought deeply he has set others thinking. Concerning no part of the extensive field of mythology have more divergent theories been advanced than nature worship. By various writers the origin of worship has been traced to ancestor deification, to the fructification engendered by earth and sky, to the fear inspired in primitive man by the lightning, storms and winds, to the fearful ravages of mysterious all-powerful beings who brought diseases and death. Others claim that the first worship of man was given to powerful and cunning animals and especially to the serpent. Still other writers have maintained that man's first gods were his own ancestors; while others see him worshipping the glory and majesty of the sun and the mystic beauty and mysterious healing powers of the moon. Others have traced his first religious ideas to the rains and the mists and have placed his primitive gods on

the mountains amid the sources of the streams or in the clouds, the home of the rains.

To these early mythological investigators it never seemed to occur that man's early conceptions of this nature were not at all religious in the modern acceptation of the terms; that they grew out of fear and mysterious dread. This primitive religious conception continued one of the strong features of man's worship far down into the monotheistic age of religion. Metaphorically the Jehovah of the Hebrews was a god of mysterious might who rode upon the winds and planted his footsteps upon the storm. At the sound of the horns of the priests of Israel walled cities fell down, just as the forests of old fell before the whistles of the wind gods. The fervid poetry of the greatest of the Hebrew poets is fairly alive with images borrowed from the polytheistic nature worshipers who surrounded them or with whom the race came into contact during its periods of exile. In this Hebrew poetry every phase of nature seems alive, as it is in the Greek and Roman, Egyptian, Babylonian and Indian poetry. In primitive Hindu literature and in the poetic imagery of China and Japan nature appears as one great whole deified in different yet, in many respects, suggestively similar ways. Among the American Indians the deification of the more striking forms of nature is everywhere evident. These primitive ideas became conventionalized, elaborated, amalgamated with other ideas and they long continued to act upon and to be reacted upon by society. A primitive belief was that people were drowned because spirits hidden in the depths dragged them down. The wind was supposed to cry like a lost child. The combination of the two made the Llorona of Spanish lands in Europe and America, who, crying like a lost child, leads the unwary, after nightfall, into a pool or bog where she or her attendants catches him by the legs and drags him down to death. Many primitive nature myths and unions of myths have become much more complicated than the Llorona. In fact little in nature worship even among the most primitive races now existing is to be found in anything like its original form. Hence the analysis of nature myths is a very complex and difficult matter. Yet the general conception of how primitive man thought is not difficult to understand.

Society and Nature Worship.—Although apparently simple, all modern manifestations of worship, however primitive, are in reality very complex; for society and its beliefs have, for long ages, been continually acting and reacting upon one another. In the more primitive society existing to-day, the medicine-men are universally believed to possess spiritual or magical powers. They are generally the medium between the people and the powers of the material universe and of the future world. They thus bear, in a sense, a divine character which belongs to them through the natural logic of their official position. Here we see, in the early stage of its development, one of the powerful factors in the organization of primitive beliefs of the nature worshipers into organized and complicated mythology. The governing class, consisting of priests or medicine-men, chiefs and leading warriors, early learned to claim descent from their nature gods, about whom they began to invent and relate the stories which we now

call myths. The sun became the great ancestor of the Peruvian priests and nobility, of the Mixteca warrior class, as of the ruling body of other great races, the most noted of which was the Egyptian. Once this relationship had been attained the glorification of the sun became the glorification of the ruling powers and the consequent subjugation of the masses to them. Ritual, ceremony, a highly organized and disciplined priesthood and religious society followed; and of this the governing class soon became the head. Among the Toltecs in Mexico, Quetzalcoatl the wind god became the ruling deity and his superior priests, who were always chosen from the nobility, were believed to be his representatives upon earth and his lineal, blood descendants. The royal family and the nobles also represented themselves as god-born. Very frequently the king was also high priest of the nation and as such he was known as *the* Quetzalcoatl, or the chief of the gods. The principal races of Chiapas and Yucatan also believed themselves to be descended from the wind god, while the Mixtecas and several tribes of Guatemala called themselves "Children of the Sun." The latter wore upon their breasts and backs the yellow symbol of the sun. In Persia and Egypt the complicated court life centred on the belief of the classes and the masses in the divine origin of the priesthood and the nobility and their descent from Re, the sun god. Thus the relation of religious primitive belief to the rulers of the people developed a complicated religio-political condition that finally became very complex in its nature. Out of this condition grew the acknowledged relationship of the hierarchy of the gods. This was the birth of the great religious systems of Persia, Babylonia and Egypt, which continued to grow more complex until their ultimate decline and disappearance. This, too, is more or less the path followed by the great religions of antiquity, all of which bear plainly the marks of primitive nature worship. The development of a religious theocracy gave very specified functions to the most prominent of the deities. Thus Thoth, the Egyptian wind god, being the original messenger god, became the carrier of souls; and the moon goddess, Isis, the mother of medicine and the healing art. Thoth, as the bearer of moisture and rains and the generator of growth, became the culture god, the patron of learning and the judge of good and evil in men's lives. All these conventionalized ideas of Thoth and Isis are very far removed from primitive man's conception of the wind and the moon as factors in his life. The great changes that took place were due to the peculiar organization of Egyptian society and the antiquity of her civilization.

Animism.—Primitive man undoubtedly held beliefs that we can scarcely comprehend to-day. One of these has been termed animism, a designation that appears to mean different things to different investigators and writers using it. It has been variously defined as belief in souls, spirits and magic power.

All recent investigation tends to show that primitive man made practically no distinction as to animation or life, between himself and the active elements of nature around him. The sun, moon, stars, winds, clouds, thunder and lightning were beings like himself who had at

their command very superior magic power. The stories of all Indo-Europeans and the American Indians are filled with myths depicting the contests in magic that took place between their deities and nature heroes. The Indian stories especially present characters essentially human, so human indeed that they are frequently deceived and duped not only by man himself but also by the lower animals and even at times by inanimate things. These hero characters are neither divinities, nor souls, nor spirits in the modern acceptance of the terms. They are simply the wielders of magic power. Therefore, when certain writers on mythology talk glibly about the religious emotion in the presence of nature giving birth to animism, they are speaking about the past in terms of to-day, forgetful of two facts. The first of these is that even races as far advanced in civilization as the Indians of southeastern Canada and the United States seem to exhibit no appreciation of the beauties of nature, as nature itself. The second is, that religious emotion is the result of the teachings of organized religion, exercised consciously or unconsciously to stir up such feelings. Fear and terror of any object inspired respect in all ages of the past as they do to-day. Out of these primal elemental feelings combined with that of admiration, ancient religious beliefs and systems were built up slowly from primitive nature beliefs. The belief in souls and spirits, as things apart from the existence of humanity, came very much later in the religious development of humanity.

Transmigration.—Intimately connected with animation is the belief in transmigration. In fact the one presupposes the other; and both seem to belong to certain stages in the social development of all society. The wind was a most powerful agent of destruction, the mysterious beings hidden in the clouds shouted with their thunderous voices and shot forth their darts of fire. Other beings sent forth the rain from the heavens and the mountains. Yet they all remained invisible as did the spirits that moved the trees and the water; therefore, they must possess the power of rendering themselves invisible, reasoned the nature worshipper. The same mode of reasoning accounted for spirits in everything and endowed the personified elements, planets and phases of nature with the magical power of taking upon themselves other bodily forms at will. Out of this idea of transmigration grew the Hindu belief in reincarnation, which, in the case of Vishnu (q.v.), was carried to an almost unlimited number of bodily changes, each one bringing with it a new existence upon earth. Among many fairly civilized races there still exist in the masses at least a belief in spirits that inhabit trees, rocks, lakes, rivers, mountains, hills, clouds, caves and winds; and this belief teaches us how nature worship grew up and long continued to claim the unquestioned faith of humanity. The belief that human souls may be transmigrated into the bodies of animals, and vice versa, is still held by many races and peoples, and the ghost or disembodied spirit has but recently retreated from the stronghold of science; and so recent is its departure that a goodly body of so-called scientists are gravely experimenting with and seeking data as to its existence and habits.

Another development of animism and transmigration was the belief in guardian spirits

which seems to have been almost universal. Very early in his social development man is found attempting to subject to his will and his uses, by his magic, the various mysterious powers of nature. Dances, charms, incantations, amulets, magic potions and other primitive means were made use of to this end. Amulets, believed to be powerful, were carried about on the body for self-protection and the wearer made efforts to get some supernatural being to become his protector. Often this being was supposed to reside in the fetish he carried upon his person. These developed by a complexed society became, in the course of time, household gods, probably through totems. Later society made patron saints to replace the grosser conceptions of heathenism. But all hail back to nature worship with its belief in transmigrating spirits, which has been father to ghosts, fairies, pigmies and a host of good and of evil-disposed supernatural beings.

Taboo.—Connected with these supernatural beings, which later became classed as gods, demigods, ghosts, or non-natural beings, were many taboos or restrictions on the actions of humanity with respect to these nature spirits. The taboo might be a restriction from doing a certain thing at a certain time or under a certain condition; or it might enjoin the performance of a certain act or ceremony under like conditions. The custom of observing taboos added, in the course of time, a species of veneration and of sacredness to the act and to the object of the taboo. Thus acts intended originally for the protection of the tribe, through continued repetition, grew to be part of the most sacred ceremonies. Thus the taboos of the nature worshipers seem to have played a very prominent part in the building up of their most revered religious rituals. The taboo was closely associated with the tribal totems and with tree and other worship.

Through long years of association with nature worship particular places, days, epochs, trees, streams and persons were looked upon as sacred and, as such, subject to taboo. The emperors of the Aztecs and the Peruvians, at the time of the discovery of America, were believed by their people to be so sacred as to be almost gods; and around them clustered as many ceremonial taboos as about the temples of their most revered deities. But in each case these taboos reacted upon the ruler himself, placing many restrictions upon his actions in public and in private. Moctezuma II might not place his foot upon the bare earth lest his divine character be thus soiled. So he was carried about in a palanquin by official royal bearers, while other attendants spread before him a gorgeous carpet to protect his imperial feet from contamination when he left the palanquin. He might wear a suit of clothes but once, and if state or other reasons required a change of apparel a dozen times a day, it also demanded a completely new outfit. But while to wear a suit of clothes twice would defile the emperor, the representative of the gods, it was likely to bring special heavenly blessings to anyone of noble birth wearing it. So Moctezuma's cast-off clothing was eagerly sought and proudly worn by the highest nobility in the empire. In Peru it was taboo to make the vessels of the temple of the sun in the capital of any other material than gold whose shining color represented the

radiant face of the deity; while all the furnishings of the moon goddess were required to be of silver. This latter example well illustrates the extreme growth of naturalistic ideas from commonplace, natural associations to taboo of the most rigid sacred character. About these nature taboos grew up many legends to account for them or to explain them. The Peruvians asserted that gold was formed from the tears of the sun god; the Mixtecas declared that it was the sacred excrement from his shining body. The Colombian Indians in the neighborhood of Bogotá inaugurated their new emperor into office by painting his naked body completely with gold dust, thus symbolizing that he was the direct representative of the sun, the great racial father upon earth. Such complicated ceremonies with their rigid, uncompromising taboos, imply a long-developed civilization or culture built upon nature worship.

The Nature Gods.—Nature worship, which, as has already been said, had its origin in the fear of the destructive forces of nature and a desire to placate them, or in respect for virile qualities in the same, grew in time, as man became more civil in his habits, to be a very complicated institution. Under the Aztecs, Mayas, Quiches, Zapotecas, Mixtecas, Pueblo Indians and Peruvians in America and among the great civilized nations of Europe, northern Africa and southern and western Asia, in the pre-Christian era, nature worship had become organized, in each case, into a most complicated religio-philosophical system which defined the attributes and sphere of action of each of the deities and explained his relationship to the gods as a whole, to the state, to the priesthood, to the nobility and to the masses. This called for an extensive classification and cataloguing of the nature deities. This had already taken place in the religious systems of all the great civilized nations in pre-Christian days. Naturally, under such a system, where almost every phase of animate nature was represented by its special deity, the list of the gods became very great. Yet they all came under a few primary divisions. The upper religions were occupied by the sun, moon and other planets, by the dawn and the darkness, the clouds, the thunder and the lightning, the winds of the four quarters of the heavens and their accompanying night spirits or wind spirits. In most nature religions these regions were divided into the upper heavens, inhabited by the sun, moon, planets and gods of dawn and darkness; and the lower heavens, the home of the clouds, winds, rain gods and other deities of the elements. The earth was the home of the deities of growth and fertility and the general habitat of the household penates and guardian spirits; while the regions within the earth or beyond the borders of the natural world, that is out on the great elemental ocean which, in most mythologies, surrounded the earth, were the regions of death and decay. Within the earth, too, quite frequently were the regions of birth. These ideas and divisions sprang naturally out of nature worship. At death all things go back into the earth; at birth all the vegetable kingdom evidently comes out of it. This was one of the patent facts that first appealed to the imagination of myth-making primitive man. There was a tendency to

divide the deities of these divine regions into beneficent and malevolent beings. Thus arose the idea of the warring of the nature gods.

The Functions of the Gods.—Nature worship, originating independently, as it undoubtedly did, in different quarters of the world, naturally developed along different lines among people racially and linguistically different. But as the origin of the pantheistic conceptions that distinguished it were essentially the same, there is a striking similarity in the functions and attributes of the nature gods everywhere. The earth, which gives birth to all things, is the universal mother; the sky, which sends the fructifying rains, is the husband of the earth and the great nature father. The sun, with his vivifying rays is the father of growth. The winds, with their ceaseless movements and their great speed, become the messengers of the gods, the bringers of culture and the purifiers or healers. But there are beneficent winds and harmful winds, gentle winds and destructive winds. Those working in the interest of man are represented as in a constant struggle with those seeking to harm him. This feature of nature worship is strongly evident in many myths. In the Mexican mythology Quetzalcoatl, the beneficent east wind is represented as the culture hero struggling with Tetzcatlipoca, the black spirit of the night, or the night wind. Hiawatha fought and defeated the Great Pearl Feather, the wind that broods over the pestilential marshes; and he fought his own father Mudjiekierwis, the west wind and the father of all the winds of heaven, who finally shares his kingdom with him, making him the Keewatin, the northwest wind, the home wind.

The Serpent in Nature Worship.—Everywhere the serpent drags its tortuous length through the habitat of the nature gods. Many explanations of its presence there have been presented by students of mythology, but most of these explanations have been unfortunately fanciful or manufactured to fit preconceived theories. The serpent is inseparably associated with the wind gods. Sometimes, he is a kindly deity; at others he is the spirit of malevolence. This is a natural development of nature and in no way demands a supernatural explanation since it fits in with the nature of the winds. Quetzalcoatl (q.v.), the great culture hero of Mexico, Yucatan and Guatemala, was represented as a plumed serpent, and the serpent formed the most conspicuous decoration of his temples. Yet others of the Mexican wind gods also bore the sign of the serpent. The robe of the mother of the gods was represented as consisting of interwoven snakes. The serpent was frequently intimately connected with the deities of fruition and birth, probably because the wind gods were also thus connected. But the destroying force was also represented as a winged serpent in many parts of the world. This is but another form of the evil wind. This latter conception gave birth to the dragons of destruction bearing with them fire or lightning as their destroying agents. From this conception to that of the evil one, the old serpent, the personified force of evil as found in the Persian and other related religions, is but a step. Christianity and the Hebrew faith borrowing the imagery of the nature religions have made it vividly familiar to us.

In Roman and Greek mythologies, the gods of healing are associated with the serpent and not the least of these is Apollo. This association of the serpent with the gods of birth and healing explains their relationship to public worship which has produced so much discussion and investigation and has given birth to the so-called theory of serpent worship. With the Chinese, as with the Toltecs, the wind god (in the case of the Chinese in the shape of a dragon) became a sort of world divinity, the great wisdom, the universal benefactor. As the fructifying rain bringer, the serpent represented kindly forces; as the rain preventer his tendencies were evil.

The Cross in Mythology.—Throughout all primitive America and in many of the mythologies of the eastern hemisphere the world was divided into four quarters over which ruled one of the winds, all of which were frequently represented as so many serpents or dragons. Quetzalcoatl, the Toltec culture god, sailed away to the unknown land on a raft of snakes, or in a boat moved by supernatural serpents, which were at once symbolical of his origin as a wind god and his office as the greatest culture hero of the American races and the symbol of divine wisdom and earthly progress. Being the symbol of fertility, the serpent naturally became that of the so-called pallic worship which was also symbolized by the cross, as the representative of the four quarters of the earth in which lived the winds and the rain gods. In pre-Columbian times the cross was the symbolical representation of the activity of the winds as the bearers of fertility throughout Mexico, most of Central America and the Pueblo and some other Indians of the United States. In the form of the swastika (the four-footed cross with the ends bent, generally at right angles), the cross became the symbol of good fortune and (among the American Indians) of generation. The Cretan mother goddess, the great deity of fertility, is represented, in her surviving statues, with snakes coiled about her waist and arms; and she was worshiped in the temple of the sacred cross. Throughout Crete, where her worship seems to have had a very important place, the cross was looked upon as a sacred symbol. Like the rain gods of Mexico and Central America, the mother god of Crete was worshiped on the tops of the hills and the high places from whence descended the fructifying waters. Like the tlaloeks and other gods of the rain cross she was connected with death and life, more especially the latter. In the course of time the cross, especially in America, came to form a very important part of the decoration of temples and sacred places in pre-Columbian days. The trail of the cross, like the trail of the serpent, runs across Mexico and Central America and a very considerable part of the United States.

Fire.—Along with sunshine, rain, air in motion and regeneration, fire early became for man one of the sacred elements. To him it symbolized (among many races) the sun, the great generator and the source of all heat. By the use of fire it was possible for him to greatly enlarge his range of diet, to fell the huge forest trees and shape his canoes from them.

It enabled him to shatter great masses of rock and to shape them roughly to his ends.

Later on it enabled him to smelt metals and to attach them to his car of progress. As it was hurled from the cloud it became symbolical of the power that hurled it. As it was vomited forth from the volcanoes, it came to signify the titanic forces of the underworld and became inseparably connected with punishment for offenses connected with the infernal regions, in various mythologies. From these primitive beliefs later religious systems borrowed much of their systematized ideas of the nature of future punishment.

The Future Life.—As the beneficent beings who brought their favors to the earth occupied the upper air; and as there, too, is the home of the sun, the moon and the planets which were supposed to strongly influence human life for good or evil, very many races looked upon these regions as the home of their future life. Some beliefs held that the souls of the dead went to the sun, others to the moon, still others to the great cloud land, a mid-region between the earth and the home of the superior deities. Some races placed the future world in the far north or northwest, in the region of the northern lights, whose brilliancy probably suggested the idea. Among many Indian tribes the rainbow was believed to be the bridge that spanned the great gulf separating the earth ocean and the sky ocean. Numerous other American tribes believed that the dead went to some great underground region. But all the nature religions presented the future life as essentially the same as that upon earth though surrounded by happier, because more fortunate conditions. Communication was not only possible between the earth and the future world but the rainbow bridge had been climbed or the great gulf had been frequently crossed in the magic stone canoe by the mortal heroes of nearly every United States Indian tribe. Some legends depict the tribal hero as scaling the heights of heaven on the back of a great bird, or in the wicker-car of the star or sun-maidens or in numerous other manners; for to the nature worshiper the universe was one great whole, the parts of which were not essentially different from one another.

Theories of Nature Worship.—At the head of the early naturalistic school is Max Müller. He maintains, with the disciples of his school, that the worship of nature was the primary religious efforts of man; and he attempts to prove his position by means of comparative mythology. His theory, which applied only to the Indo-European races, was carried to an absurd limit by many of his school. E. B. Tylor looks upon the worship of the dead as the earliest of human cults and Herbert Spencer takes the same ground. The latter derives from this source all other forms of worship. Tylor traces the history of the so-called animistic faith, while Spencer displays its evolution. Wundt maintains that religion finds its origin in the primitive belief in human souls and in an early animism out of which a belief in magic and fetishism grew. Dunkheim believes that the totemic principle, or belief in mysterious power (the mana or magic power) is the source of all religion. All of these investigators have hit upon certain important truths, but no one of them has been able to grasp the significance of the wide field of mythology, for they all have made cate-

gorical statements upon which they have built up elaborate theories.

Birmingham Southern College.

NAUCRATIS, nô'kră-tīs, Egypt, an ancient Greek colony, the remains of which are 50 miles by rail southeast of Alexandria. It existed as early as the beginning of the 7th century B.C., and was approached by a navigable canal in the western part of the delta, near the Canopic branch of the Nile. Its chief period of splendor was during the reign of Amasis II, 570-520 B.C., under whom it was recognized as the official capital of the Greeks in Egypt. Its site was rediscovered in 1884 by Professor Flinders Petrie. Subsequent excavations have uncovered the remains of buildings described by Herodotus, the Hellenium, temples to Apollo, Aphrodite, the Dioscuri, and others; and there have been valuable finds of early Greek pottery and other archaeological treasures.

Consult Petrie, W. M. F., *Naukratis* (London 1886); Gardner, E. A., "Naukratis II," *Publications, Egyptian Exploration Fund*, Vols. 3-6 (London 1886-88); Hogarth, D. G., "Naukratis, 1903," *Journal of Hellenic Studies*, Vol. 25 (London 1905).

NAUCYDES, nô-sī'dēz, Greek sculptor. He flourished in the first quarter of the 4th century B.C. His birthplace was Argos, and he was the pupil of the elder Polyclitus of the Peloponnesian school of sculpture. He carved a gold and ivory statue of Hebe for the temple of Hecate at Argos; a bronze statue of Hecate; a Hermes; several statues of Victory; a portrait of the poetess Erinna; *Phryxus Sacrificing the Ram* (for the Acropolis at Athens); and a discus thrower. The younger Polyclitus was his pupil.

NAUEN, nou'ēn, town, East Germany, in Brandenburg, is located 25 miles northwest of Berlin. Its manufactures include machinery, soap, and food products. A powerful radio station here was dismantled in 1945-1947. The town was first mentioned in 981, and was chartered in 1292. Pop. (1946) 13,106.

NAUGATUCK, nô'gă-tŭk, town and borough, Connecticut, New Haven County, is located on the Naugatuck River, 5 miles south of Waterbury, on the New York, New Haven and Hartford Railroad. The chief industry is the manufacture of rubber footwear and chemicals, and there is a huge rubber regenerating mill. Other manufactured products are cosmetic containers, plastics, safety pins, chocolate bars, airplane instruments, glass, mirrors, copper floats, chains, metal stampings, tools, and screw machine prod-

ucts. Charles Goodyear, discoverer of rubber vulcanization, lived here and established a factory here in 1843. Two early buildings of historic interest are Porter Tavern, built about 1752, and Collins Tavern, built in 1810.

Naugatuck is an Indian phrase meaning "one tree." In 1679, while still a part of Mattatuck (now Waterbury), the community was referred to as Judd's Meadows. In 1773 a new ecclesiastical society was created under the name of Salem Society, and somewhat later the area came to be called Salem Bridge. It was incorporated in 1844 as Naugatuck, the name by which the town had been more generally called since the opening of a post office there in 1834. The borough was incorporated in 1893. The government is vested in a warden and board of burgesses who hold office two years and who appoint many of the administrative officials. Pop. (1950) 17,455.

NAUGATUCK, a river in Connecticut. It rises in the northern part of Litchfield County, flows south through a hilly part of the state, and enters the Housatonic River at Derby. It supplies water power to many mills and factories. Waterbury is the chief city on its banks.

NAUGHTY MARIETTA, nô'tī mār-ī-ĕt'ă, a light opera by the Irish-American composer, Victor Herbert (1859-1924), produced in New York in 1910. Several of its songs are still widely popular and are frequently heard. Among them are *Italian Street Song*, *Ah! Sweet Mystery of Life*, *I'm Falling in Love with Someone*. Herbert composed some 40 light operas.

NAUHEIM or **BAD NAUHEIM**, băt' nou'him, town, West Germany, in the state of Hesse (1945), is located 17 miles northeast of Frankfurt, on the northeastern slope of the Taunus Mountains. It is a well-known health resort noted for its warm carbonated mineral springs which are highly saline. It became a town in 1854. Napoleon Bonaparte gave it to Marshal Louis Davout, but from 1815-1866 it belonged to the electorate of Hesse-Cassel. It was ceded to the grand duchy of Hesse-Darmstadt in 1866. Pop. (1946) 12,909.

NAULETTE, nô-lēt', a limestone cave in Belgium, on the Lesse River, near Dinant, where in 1866 an imperfect human lower jaw was found together with bones of the mammoth, rhinoceros, and reindeer. The jaw, now in the Brussels Museum of Natural History, was assigned to the Mousterian period.

NAUMACHIA, nô-mă'kī-ă, or **NAUMACHY**, nô-mă-kī (from the Greek *naus*, ship, and *machē*, battle), among the Romans a public spectacle, representing a naval action. Julius Caesar was the first who exhibited a spectacle of this sort, which soon became the favorite amusement of the Roman people. Buildings were erected by the emperors, specially adapted for the purpose. They resembled the amphitheaters, and like them were at first built of wood. Domitian erected one of stone. A *naumachia*, built by Augustus, was 1,800 feet long and 200 feet wide, and was capable of containing 50 ships with three banks of oars, besides many small vessels. They were flooded by means of subterranean canals, so that the ships were raised from the dry floor before the eyes of the spectators. These sea-

fighths were exhibited with the same splendor and reckless disregard of human life which characterized the gladiatorial combats. Titus exhibited a sea fight in which 3,000 men were engaged and ships almost equal in number to two real fleets were shown in combat by Domitian. The crews generally consisted of gladiators, prisoners or condemned criminals.

NAUMANN, Friedrich (in full, JOSEPH FRIEDRICH), German politician: b. Störmthal, near Leipzig, Germany, March 25, 1860; d. Travemünde, Germany, Aug. 24, 1919. He left the Lutheran ministry in 1894 to enter politics. In 1896, together with others, he founded the National Socialist Party, of which he became the first president. In his book *Mitteluropa* (1915) he outlined a plan for a central European German empire. After the November Revolution in 1918, he became one of the founders of the German Democratic Party.

NAUMANN, Johann Friedrich, German ornithologist: b. Ziebigk, near Köthen, Germany, Feb. 14, 1780; d. there, Aug. 15, 1857. He studied with his father, who was an ornithologist. His most valuable contribution to the science of ornithology was *Naturgeschichte der Vögel Deutschlands* (*Natural History of the Birds of Germany*), 12 vols. (1822-1844).

NAUMANN, Johann Gottlieb, German composer: b. Blasewitz, near Dresden, Germany, April 17, 1741; d. Dresden, Oct. 23, 1801. The interest of a rich Swedish amateur, Weeström, enabled him to go to Italy at the age of 16, and there he studied under Giuseppe Tartini. He became court composer of sacred music at Dresden in 1764, of chamber music in 1765, and *kapellmeister* in 1776. He accepted an invitation to reorganize the orchestra at Stockholm in 1777. His music, including operas, oratorios, and symphonies, was essentially Italian in style.

His son, KARL FRIEDRICH NAUMANN (May 30, 1797-Nov. 26, 1873) was a mineralogist and geologist. He was a professor at Freiberg in 1826, and at Leipzig from 1842 to 1872. Among his works are *Elemente der Mineralogie* (1846; 15th ed. 1907) and *Lehrbuch der Geognosie*, 2 vols., with an atlas (1850-1853).

Karl Friedrich's son, KARL ERNEST NAUMANN (Aug. 15, 1832-Dec. 15, 1910) was an organist and composer. In 1858 he received the Ph.D. degree at Leipzig University, where he published as his dissertation *Über die verschiedenen Bestimmungen der Tonverhältnisse*. Later he was music director and organist (1860-1906) at Jena University, and became professor there in 1877. His compositions were chiefly in the field of chamber music.

Karl Ernest's cousin, EMIL NAUMANN (Sept. 8, 1827-June 23, 1888) was also a musician. He was a pupil of Felix Mendelssohn (1842), and studied further at Leipzig University (1843-1844) and Bonn University. He was appointed court director of sacred music at Berlin in 1856. Beginning in 1873, he was at Dresden, where he lectured at the conservatory. He published *Die Tonkunst in der Kulturgeschichte*, 2 vols. (1869-1870), *Deutsche Tondichter* (1871), and other volumes.

NAUMANNITE, nō'mán-īt, in mineralogy, the name given to a native selenide of silver and

lead found in the Harz Mountains, Germany, and so called after K. F. Naumann. It has a formula of (Ag₂Pb) Se, and occurs in large cubes, or masses, which have a metallic luster. The specific gravity is 8.0. The color is iron-black. Naumannite is also found in Owyhee County, Idaho.

NAUMBURG, noun'bōōrk, or **NAUMBURG AN DER SAALE**, an dēr zā'lē, city, Germany, located in Saxony-Anhalt, on the Saale River near the junction of the Unstrut, 25 miles south-southwest of Halle. Its varied manufactures include toys, soap, metal goods, and food products. The Romanesque-Gothic cathedral of St. Peter and Paul, with its notable sculpture, dates from the 13th and 14th centuries. Naumburg was founded by the margraves of Meissen in the 11th century, and beginning in 1028 was the seat of the bishopric of Naumburg-Zeitz. It later belonged to the Hanseatic League. In 1564 it passed to the electors of Saxony, and in 1815 to Prussia. It was part of Prussian Saxony until after World War II, when it passed to Saxony-Anhalt. Pop. (1946) 41,379.

NAUNDORFF or **NAUNDORF**, noun'-dōrf, **Karl Wilhelm**, French pretender: d. Delft, Netherlands, Aug. 10, 1845. In 1812 he was an established watchmaker at Spandau, Germany. He married Johanna Einert in 1818. In about 1824 he adopted the title of duc de Normandie, and in 1833 went to Paris to press his claims as the Dauphin, Louis Charles de France. He bore a striking resemblance to the Bourbons. After bringing suit against Marie Thérèse Charlotte, duchesse d'Angoulême, for the restitution of the dauphin's private estate, he was expelled from France in 1836. He never ceased to claim that he was Louis XVII, titular king of France (q.v.). His tomb bears the inscription, "Louis XVII, roi de France et de Navarre (Charles Louis, duc de Normandie)."

NAUNTON, nōn't'n, **Sir Robert**, English statesman and political leader: b. Alderton, Suffolk, England, 1563; d. Letheringham, Suffolk, England, March 27, 1635. He received the B.A. degree at Trinity College, Cambridge, in 1582. In 1585 he became a fellow there, and in 1594 public orator. For several years, ending in 1600, he travelled on the continent, and supplied information on conditions there to Robert Devereux, earl of Essex. He entered Parliament in 1606, and sat in five parliaments. In 1618-1623 he was secretary of state. His *Fragmenta Regalia*, first published in 1641, is a valuable account of Elizabeth I's courtiers.

NAUPLIA, nō'plī-ā (Gr. ΝΑΥΠΛΙΟΝ), city, Greece, capital of Argolis and Corinth Department, located at the north end of the Gulf of Argolis, about 25 miles south of Corinth. A seaport, it was occupied by the Venetians during the Middle Ages, and later, by the Turks. In 1830-1834 it was capital of Greece. Pop. (1951) 8,546.

NAUPLIUS, nō'plī-ūs, in Greek mythology, the father of Palamedes. He is said to have avenged the death of his son by deceiving the Greeks by false beacons, as they returned from Troy, causing their vessels to be wrecked.

NAUPLIUS, in zoology. See **LARVA**.

NAURU, nā-ōō'rōō (formerly PLEASANT ISLAND), island, located in the southwest Pacific, 26 miles south of the equator at longitude 166° 56'E, 160 miles west of Ocean Island. It is oval-shaped, has a circumference of about 12 miles, and is about 3.5 miles in length and 8 square miles in area. It has large phosphate deposits.

Nauru was discovered in 1798 by Captain Fearn of the American whaling vessel *Hunter*, and named Pleasant Island by him. It was formally annexed to the German Empire in 1888, and became part of the Marshall Islands Protectorate. Australian forces occupied it in 1914, and held it until June 1921, when a civil administrator took over under the terms of a League of Nations mandate. The Japanese occupied Nauru during World War II, from 1942 to 1945. In 1947 it came under a United Nations trusteeship jointly held by Great Britain, Australia, and New Zealand; and Australia assumed administration.

NAUSICAA, ancient Greek heroine mentioned in the *Odyssey*. She was the daughter of Alcinoos, king of the Phaeacians, who befriended the shipwrecked Odysseus.

NAUTCH, nāch (Hind. *nāc*), in India, a dance performed by the dancing girls attached to the temples, called Nautch girls, who are brought up and trained in the art.

NAUTICAL ALMANAC, a publication containing tables and astronomical data for the use of seamen. The *American Nautical Almanac* has been issued annually since 1855 by the United States government. See also NAVAL OBSERVATORY — *Period Since 1893*.

NAUTILOIDEA, nō-tī-loi'dē-ā, one of three subclasses in the Cephalopoda. The genus *Nautilus*, which contains the chambered nautilus, is the last surviving member of this once large and varied group of Cephalopods.

The earliest fossil nautiloid shells appeared in the Upper Cambrian Period and became greatly differentiated and very abundant in the Ordovician and Devonian. By the Cretaceous Period they had diminished to but a single order or group, the Nautilida, and by mid-tertiary had almost completely disappeared. Since then they have persisted only as a single genus, *Nautilus*, which occurs in the tropical portions of the western Pacific and Indian oceans. Over 300 genera and 2,500 fossil species have been described in this subclass. The large number of genera are grouped into 14 orders.

The study of this group as well as other fossil cephalopods is exceedingly complex and relationships between the various orders are far from being understood. A vast number of terms have been employed to describe the complex morphology of the shell structure.

Consult Flower, R. H., and Kümmel, B., "A Classification of Nautiloidea," *Journal of Paleontology*, 24:604-616 (1950); Shrock, R. R. and Twenhofel, W. H., *Principles of Invertebrate Paleontology* (New York 1953).

WILLIAM CLENCH.

NAUTILUS, nō-tī-lūs, a genus of Cephalopods in the subclass Nautiloidea. Only three or four living species are known, of which *Nautilus pompilius* is the most abundant. These various species occur in the tropical portions of the Indian and western Pacific oceans. They live on

the ocean floor in depths ranging from four to as much as 700 meters, and they are captured mainly in fish traps. Little is known regarding their life history. The shell they produce is quite remarkable as it is septate, that is, it contains a series of chambers, the animal itself occupying the outer or last chamber produced. As the animal grows larger, the outer wall of the shell is built forward, and the animal moves forward and then seals off the vacated area with a thin partition or septum. All of the septa are perforated in the middle by a single, narrow tube, or siphuncle, which is a slender tubular prolongation of the visceral hump. All of the vacated chambers contain a gas similar to air, except for having a little less oxygen and somewhat more nitrogen. This gas increases materially the buoyancy of the shell, and makes it easier for the animal to swim.

A thin mantle covers the entire animal and, in addition, adheres to the shell. The head contains a pair of lateral eyes which lack crystalline lens. The tentacles, which may number up to 90, form two circles about the mouth. There are a pair of horny or calcareous jaws, a radula, and a tongue. There is a short tubular esophagus which connects with the stomach, and behind the stomach there is a large liver and other digestive glands. A simple tubular intestine is coiled backward and ends at the anus, which empties into the anal chamber or mantle cavity. There are four gills and no ink sac. The heart lies ventral of the intestine and posterior to the gills.

There is a much thickened area over the head known as the hood, which acts as an operculum when the animal withdraws into the shell.

WILLIAM CLENCH.

NAUTILUS, in hydraulic engineering, a diving bell (q.v.) requiring no suspension. Water admitted through the cock into pipes flows into the exterior chambers, causing the apparatus to sink. The workmen enter through an aperture at the top, closed by an airtight cover, and can in still water move the machine in any required direction by stepping on the ground and pushing. Air is condensed in a reservoir at the surface to a degree somewhat greater than the condensation due to the depth, and passes through a pipe into the chambers, rendering the machine specifically lighter than water and enabling it to lift stones or other objects below. A gauge indicates the amount of lifting power attained as the air is admitted into the chambers.

NAUTILUS, The U.S.S., a submarine embodying some principles of the fictional archetype for which it was named, described in 1870 by Jules Verne in his classic tale of scientific adventure, *Twenty Thousand Leagues Under the Sea*. But where the power plant of the fictional Captain Nemo's *Nautilus* was electric (like the real submarines the French Navy began building only 16 years later), the U.S.S. *Nautilus* is powered by an atomic pile. The keel of this first atomic-powered submersible was laid in June 1952, and she was launched in January 1954. The engineering plant consists of a reactor in which the terrific power of uranium is harnessed to a "slow" chain reaction. The uranium, consumed at the rate of about one pound per month, requires replenishment only once a year. Situated behind the control room is the reactor. Heavily lead-shielded for protection against radiation, it

converts water into superheated steam which, in turn, operating through a heat exchanger, converts other water into steam that drives a turbine. Thus, the *Nautilus* is not only the first atomic but also the first steam submarine.

With the exception of its power plant, and of the absence of fuel tanks and of most batteries, internally the 3,000-ton *Nautilus* resembles the standard-type submarine in having a forward torpedo room, fore and aft crew's quarters, air purifier, ventilation system, complicated diving system, and so forth. Externally the principal design changes are the absence of a snorkel and the modified contour of the 300-foot hull to facilitate increased underwater speed. The underwater speed of this pioneer atomic-powered submersible is over 25 knots, or approximately double that of a standard-type submarine. Another great advantage is the ability to continue submerged for weeks. Guided missiles are among its equipment of nuclear weapons.

NAUVOO, nō-vōō'; nō'vōō, city, Illinois, in Hancock County, 10 miles south of Fort Madison, Iowa, on a promontory on the Mississippi River and served by the Atchison, Topeka, and Santa Fe Railroad at East Fort Madison, Ill. It is situated at an altitude of 620 feet in a fruit-growing region and its principal industries are connected with the manufacture of wine and blue cheese.

Settled in 1830 as Commerce, its name was changed to Nauvoo when Joseph Smith and his followers of the Church of Jesus Christ of Latter-day Saints (Mormons, q.v.), settled there in 1839. The Illinois legislature granted the Mormons a charter and a militia called the Nauvoo Legion. Smith was mayor and commander in chief of the legion. By 1845 Nauvoo was the largest city in Illinois, with a population of 20,000. A temple was begun on a hill, but it was burnt and demolished later. After a riot in which Smith and his brother Hyrum were murdered, the Mormons left the settlement. From 1849 to 1857 the Icarians, a French communistic group under Étienne Cabet (q.v.) had a settlement there but internal disagreements split the community some going to St. Louis and others to Corning, Iowa. Later, Irish and German immigrants rebuilt Nauvoo. Grape growing was introduced and wine making prospered. In 1920 the making of blue cheese was begun. There is an annual Grape Festival attended by thousands. The Joseph Smith homestead, the Brigham Young house, and other old buildings are historic shrines. Pop. (1950) 1,242.

NAVAJO CHURCH, nāv'ā-hō. This name is given to a remarkable spire of white sandstone rising from the top of the red cliffs just west of the Continental Divide a short distance east of Gallup, N. Mex. It is visible for several miles from the Atchison, Topeka, and Santa Fe Railroad near Wingate station. Navajo Church is an object of veneration for the Navajo Indians of the vicinity. Its rock formations have several large caves.

NAVAJO or NAVAHO INDIANS,¹ an important tribe of the Athapaskan stock of Indians, in 1955 on four reservations aggregating 15,364,828 acres in northeastern Arizona, north-

western New Mexico, and southeastern Utah, at an average elevation of 6,000 feet above sea level. According to Fray Alonso Benavides (1630), who referred to the tribe as "Apaches de Navajó," the word "Navajo" meaning "great planted fields," the name was never applied to the Navajo by themselves, their own tribal designation being "Diné" (people).

There is no evidence that the Navajo were seen by the Spanish explorers of the Southwest in the 16th century, although the latter passed through the present Navajo country in 1540, 1583, and 1598. It is therefore believed that at this early period they were an insignificant agricultural tribe, but gradually increased in population largely through the adoption of natives of both allied and other stocks during succeeding years. Their territory is entirely within the arid region and their lands are chiefly desert; but in the canyons and about the bases of the mesas that abound in their territory, horticulture is practiced through deep planting in the sandy soil, while in the valley of the Rio San Juan, which is the largest stream in their country,

Navajo mother preparing a meal in front of her summer hogan.

farming is carried on to a greater extent, in 1950 the total acreage planted in vegetal crops totaling 38,064.

Agriculture, however, forms but a meager part of Navajo subsistence, his livelihood being gained principally from the flocks and herds, of which in 1953 there were 423,406 sheep, 2,284 beef and dairy cattle, and 63,879 goats, the sheep, besides furnishing the chief food supply, netting a large sum in wool and blankets. These blankets, which are celebrated, are woven by the women on simple looms and in pleasing and sometimes intricate designs of various colors. Formerly native dyes of rare delicacy of tone were employed, but these have given way to glaring aniline colors, and the decorative patterns have also been largely modified to meet the demands of the white man. The Navajo also weave belts, garters and saddle girths, and make a few basket trays, for ceremonial use. Some of the men are expert silversmiths.

Although more closely related to the Apache than to any other tribe, the Navajo are con-

¹ Modern authorities prefer *Navaho* spelling.

siderably mixed, embodying elements of Pueblo, Shoshonean, Yuman, and even of Spanish blood; hence there is perhaps a greater variety in their physical features than among many Indian tribes.

The typical Navajo dwelling is a conical framework of logs or sticks covered with brush, bark or grass, and earth, with a smoke hole at the apex and a doorway in one side. Rude shelters with open fronts are erected for use in summer. If a person dies in a house the dwelling is believed to become haunted and is destroyed.

Dr. Washington Matthews (q.v. 1843-1905), one of the foremost students of the Navajo, discovered the existence of 51 clans, grouped into about a dozen phratries, which are probably not homogeneous organizations as among some Indians. A Navajo belongs to the clan of his mother, and a man may not marry a woman belonging to his own clan, or, as a rule, one of his own phratry. The religion of the Navajo is elaborate and complicated. They have a great many ceremonies, most of which are performed for healing the sick, but others are conducted to ensure success in planting, harvesting, building, war, nobility, marriage, travel, and for bringing rain. Sacrifice, elaborate dry paintings with sand and pigments, masquerade, dancing, prayer, and song are the elements of the ceremonies, the gods being personated by the masked performers.

History.—Almost from the beginning of the 17th century the Navajo were enemies of the sedentary tribes and of the Spanish colonists, and although they were never so predatory and warlike as their Apache cousins, the Spanish villages and Pueblo settlements suffered almost continuously from their raids up to the time of the conquest of New Mexico by American forces in 1846, followed by the establishment of military posts throughout the Southwest. Treaties were made with the tribe in 1846, 1848, and 1849, but they were of no avail in keeping in check their depredations, which continued at intervals until 1858, although expeditions were led against them. In 1849, after the Navajo killed a Negro servant at Fort Defiance, it became necessary to wage warfare against the Indians from August until December, when 50 Navajo were killed and a large number of sheep and other stock were lost. Another treaty was signed, but during 1860 the depredations continued, and another expedition was led against them, but without success. In April the natives boldly attacked Fort Defiance, but were repulsed. In the winter of 1860-1861 an active campaign was made against them, and although practically their only loss was in sheep, they were compelled to sue for peace in February 1861, when an armistice of a year was agreed to, during which the troops were withdrawn. In a dispute over a horse race at Fort Fauntleroy (near the present Fort Wingate), New Mexico, a dozen Navajo were brutally killed.

Emboldened by the withdrawal of the troops on account of the Civil War, the Indians resumed their raids, which they continued almost uninterruptedly until 1863, when Col. Christopher (Kit) Carson began operations against them and a plan was formulated to transfer the Navajo from their old haunts to Fort Sumner, at the Bosque Redondo, on the Pecos River, in eastern New Mexico. All who refused to go after July 20, 1863, were to be regarded as hostile and be

treated accordingly, yet by the close of the year only 200 prisoners were at Fort Sumner or on the way there. Early in 1864 Carson made a campaign to the Canyon de Chelly in the heart of the Navajo country in northeastern Arizona, where he killed 23 and captured more than 200 of the Indians. As a result, by the close of 1864 more than 7,000 of the tribe were held as prisoners at the Bosque Redondo. By 1865 there were 8,491, but it was supposed this number represented only half of the tribe. The experiment, however, proved a failure, so that after the death of about a thousand of the Indians, the escape of others, and an expenditure of a million dollars in their support in a region ill-adapted to their progress, the remainder, numbering 7,304, were removed to their old country in July 1868, an appropriation of \$422,000 having been made in that year to give them a new start.

Since that time the Navajo have been peaceable and industrious. They make good laborers and are slowly developing agricultural pursuits, which the government has assisted by increasing the amount of water for irrigation, domestic, and stock purposes. The internal government of the Navajo, which has met much success, is conducted by a tribal council whose numbers come from various parts of the reservation. There are four sectarian missions and two mission schools on or near the reservation. In 1890 a partial census showed 17,204 Navajo; in 1950, 64,390, hence they are the largest tribe in the United States. See also INDIANS, AMERICAN—*North American Culture Areas* (Southwestern).

Bibliography.—Navajo literature has increased so greatly during recent years that only a list of the more important later titles are here included. For earlier publications consult *A Bibliography of the Navaho Indians* by C. Kluckhohn and K. Spencer (New York 1940).

For later publications: Elmore, Francis H., *Ethnobotany of the Navajo* (Albuquerque, N. Mex. 1943); Watkins, Frances E., *The Navaho* (Los Angeles 1943); Adair, John, *The Navajo and Pueblo Silversmiths* (Norman, Okla. 1944); Leighton, Alexander H., and Dorothea, *The Navaho Door* (Cambridge, Mass. 1944); Hannum, Alberta, *Spin a Silver Dollar* (New York 1945); Haile, Berard, (1) *The Navaho Fire Dance, or Coral Dance*; (2) *The Navaho War Dance* (both St. Michael's, Ariz. 1946); Kluckhohn, Clyde, and Leighton, Dorothea, *The Navaho* (Cambridge, Mass. 1946); Wheelwright, Mary C., *Hail Chant and Water Chant* (Santa Fe, N. Mex. 1946); Leighton, D., and Kluckhohn, C., *Children of the People* (Cambridge, Mass. 1947); Amsden, Charles A., *Navaho Weaving, its Technic and History* (Albuquerque, N. Mex. 1949); Wheelwright, Mary C., *Emergence Myth According to the Hanellhmayhe or Upward-Reaching Rite*, recorded by Berard Haile (Santa Fe, N. Mex. 1946); Babington, Suren H., *Navajos, Gods, and Tom-toms* (New York 1950); Reichard, Gladys A., *Navajo Religion* (New York 1950); Waters, Frank, *Masked Gods* (Albuquerque, N. Mex. 1950); McCombe, Leonard, *Navaho Means People* (Cambridge, Mass. 1951); Miller, Joseph, *Monument Valley and the Navajo Country, Arizona and Utah* (New York 1951); Ward, Elizabeth, *No Dudes, Few Women* (Albuquerque, N. Mex. 1951); Underhill, Ruth, *Here Come the Navaho!* (Lawrence, Kan. 1953).

NAVAJO MOUNTAIN, peak, Utah, rising high above the Arizona Plateau in the extreme southern part of San Juan County, Utah, at an altitude of 10,416 feet. It has rarely been ascended by white men; there are no motor roads to it, and it can only be visited by pack-trips from Goulding's Trading Post. From its summit, a short distance south of the rim of Glen Canyon of the Colorado River, a great view is obtained of the upper part of the Grand Canyon region, the Henry Mountains, the Vermilion Cliffs, and other features of the high plateaus.

Right: Navajo weaver at Roughrock on the reservation between Canyon de Chelly and Monument Valley, displaying another Navajo hand skill.

NAVAJO

A Navajo rides guard over a sheep flock, with a typical butte rock formation in the background.

Santa Fe Ry. Photos

No pictorial record of Navajo skills would be complete without an example of sand painting, using sands of different color. The Navajos use these sand pictures in healing ceremonies.

The mountain is forest clad, several springs issue from its sides, and in its northern slope are the Great Rainbow and Owl natural bridges. A dome-shaped uplift of the sedimentary rocks created the mountain, and its top is capped by Dakota sandstone.

NAVAJOITE, nāv-ā-hō'ite, a rare mineral of dark-brown color, fibrous structure, silky luster, and probable monoclinic symmetry; chemically hydrated vanadium pentoxide, $V_2O_5 \cdot 3H_2O$; found in vanadiferous uranium ore in the Monument No. 2 mine on the Navajo Indian Reservation, Apache County, Arizona, and named in honor of the Navajo Indians on whose reservation it was discovered in 1951.

NAVAL ACADEMY, United States. See UNITED STATES NAVAL ACADEMY.

NAVAL ARCHITECTS AND MARINE ENGINEERS, Society of, a society organized under the laws of New York State on May 10, 1893, its object being the promotion of the art of shipbuilding, both commercial and naval. Classes of membership, which in 1955 numbered 6,200, consist of members, associates, juniors, honorary members and associates, benefactors, and permanent members.

NAVAL ARCHITECTURE, the science and art of designing ships to give them the nautical and structural qualities needed to accomplish their commercial, military, or recreational purposes. The construction of ships belongs to the subject of shipbuilding and will be touched upon in this article only in so far as the problems of construction influence the design of ships. Naval architecture as an art dates back to the earliest efforts of man to improve his means of locomotion and transportation. The primitive canoe probably antedated the wheel, but the promotion of naval architecture to the realm of the sciences did not take place until the 19th century. It lagged behind some of the other sciences largely because it is not an exact science, susceptible to precise mathematical treatment as, for example, astronomy or electricity. Naval architecture must in fact be viewed as an art with scientific foundations, rather than as a science.

During the 18th century European mathematicians developed various theories concerning floating bodies, some of which they considered applicable to ships. Their aim was to express the underwater form of ships mathematically with the hope of arriving at forms that would offer the minimum resistance to passage through the water. In 1721 Emanuel Swedenborg, the Swedish philosopher and mathematician, wrote a treatise on the subject entitled *A Mode of Discovering the Powers of Vessels by the Application of Mechanical Principles*. The most notable scientific contributions to naval architecture during that century were those made by Fredrik Henrik Chapman (1721-1808), a Swedish naval officer who was for many years in charge of Sweden's dockyards. He began the practice of passing on his knowledge of the subject through published papers. The French also contributed much in that way. The more common practice in such matters until the 19th century was for master builders to guard as valuable secrets what had been handed down to them and what they learned from their own experience.

During the first half of the 19th century the advent of iron for shipbuilding and steam for propulsion necessitated a more scientific approach to naval architecture. The advances made in all of the physical sciences during that period also contributed to the development of naval architecture as a science. By the end of the 19th century, existing knowledge in this field was well disseminated and all of the leading shipbuilding countries of the world had schools for teaching naval architecture.

Just as in the past, the primary purpose of practically all ships today is to serve as vehicles for the transportation of men and materials. This is as true of the humble tramp ship carrying in cargo twice the weight of its hull, machinery, and outfit, as it is of the luxury liner carrying a comparatively small amount of cargo, a large amount of fuel to enable it to make high speed, and with its space devoted largely to accommodations for passengers. In the case of warships the things carried consist of ammunition, consumable stores, and fuel, besides weapons, a large crew to man the weapons, and protection against enemy weapons.

Design Requirements.—The naval architect is faced with two fundamental requirements in designing a ship: the ship must be able to go from place to place at a speed appropriate to its service, and it must be able to do so with safety under all reasonable conditions of sea, weather, and loading. The measures that are at his disposal to meet these requirements are, however, circumscribed by the fact that the thing he is designing is a floating object. The weight he can devote to any one element of the design, whether part of the ship itself or to its cargo, is limited by the consideration that a floating body can weigh no more than the water it displaces. Weight devoted to one feature of the design ceases to be available for other features. Thus, every pound of weight entering into the construction and equipment of the ship must serve a useful purpose if it is to stand critical scrutiny. The architect of a structure on land is confronted with no such problems and limitations. One of the chief preoccupations of the naval architect is, therefore, the judicious use of the weight at his disposal and as a corollary the continuous search for lighter materials and equipment and for weight-saving methods in constructing ships.

Nevertheless, by the nature of the problem the characteristics given to any particular ship must always be a compromise of its many important features. This is less so for merchant ships than for warships because the service for which the merchant ship is designed is known with some degree of certainty, whereas there is always considerable uncertainty as to the conditions under which the warship will be called upon to fight, and hence as to the relative importance of its various characteristics. See WARSHIPS, MODERN for a more complete discussion of this subject.

Classification Societies.—It is at this point appropriate to describe briefly the part that the marine insurance business plays in naval architecture. Marine insurance affects importantly the design of merchant ships because the merchant ship is a commercial proposition that must be able to compete with other ships in the same trade. Its construction must, therefore, be such that the owner will not be at a disadvantage with his competitors in obtaining insurance at reasonable rates. In order to underwrite such risks the

marine insurance companies must have some guide as to the quality of the ship they are requested to insure. This is furnished by classification societies that have been established in a number of maritime countries: Lloyd's Register of Shipping combined with the British Corporation Register in Great Britain; the American Bureau of Shipping in the United States; the Bureau Veritas in France, and others. These societies set standards of design, construction, and equipment for merchant ships, many backed by laws and international agreements.

Normally all ships other than warships are built in accordance with the standards and under the supervision of one of these societies or the ship can be built without such supervision, surveyed afterward, and then granted classification if it meets the society's requirements. A classed ship must be surveyed from time to time in order to retain its classification. So long as the ship's classification remains in effect the owner can obtain insurance at prevailing normal rates. The principal features that are covered by classification are reserve buoyancy as implemented by load line regulations, watertight subdivision, communication and other equipment stipulations, minimum requirements as to quality, disposition, and dimensions of materials used in the construction of ships, and regulations with regard to tonnage measurements. Classification thus acts in the common interests of the owner, the insurance underwriters, the shipper, and the traveling public. There is divided opinion whether such associations have been a stimulus to the development of naval architecture, or whether they have been a retarding influence due to their normal conservatism.

Buoyancy.—When a ship is floating in still water the weight of water it displaces is exactly equal to the weight of the ship and its contents. The volume of the enveloping surface of the ship must, however, be greater than the volume of water displaced, otherwise the slightest additional weight would cause it to sink. For safety there must, therefore, be a margin or reserve of buoyancy over and above the buoyancy required for flotation. The percentage of reserve buoyancy provided in a design depends on the kind of vessel in question, ranging from close to zero for a submarine when in diving condition, and about 25 per cent when running on the surface to 100 per cent or more for passenger vessels with watertight upper decks and high sides. Certain types of warships, such as large cruisers and airplane carriers, also have large reserve buoyancy.

Reserve buoyancy fluctuates with the loading of ships. The actual amount considered necessary in merchant ships varies with the size and type of vessel, with the season of the year, and with the geographical area in which the ship will operate. Vessels engaged in winter service in the North Atlantic Ocean are considered to need a greater margin of safety in this respect than in any other service. Because reserve buoyancy can be easily visualized and checked by measuring and controlling the draft and freeboard of ships, load line regulations have become the standard method of controlling reserve buoyancy.

Great Britain, acting through the government Board of Trade in conjunction with Lloyd's classification society and the associations of naval architects, was the first to give legal status to such requirements. So far as merchant ships operating under the American flag are concerned,

the first act of Congress requiring compulsory load line markings was passed in 1929 and became effective on Sept. 2, 1930. It applied only to American ships engaged in foreign trade. A Coastwise Load Line Act was passed by Congress in August 1935, covering also vessels operating on the Great Lakes. Broadly speaking, the objects aimed at in load line requirements are to permit the deepest possible loading of the vessel compatible with safety under all conditions of weather and areas of operation, after making provision for minor casualties that might jeopardize the reserve of buoyancy.

Stability.—In addition to adequate buoyancy ships must also have the necessary stability to resist the capsizing effect of wind, waves, unequal load distribution, and flooding to at least a limited extent. Meeting the requirements of stability are unique to naval architecture and present problems encountered in no other engineering profession. The general principles underlying stability are comparatively simple and may be readily understood by analyzing what happens when a ship floating in still water is given a small inclination from the upright as shown in the accompanying figure.

Fig. 1. $W'L'$ is water line when ship is upright. WL is water line when ship is inclined at angle θ .

The elementary rules of hydrostatics apply to ships under such circumstances. These are that the weight of the ship equals the weight of the water displaced and that with the ship upright the center of gravity G of the ship and the center of gravity of the water displaced, known as the center of buoyancy B , lie in the same vertical line. When the ship is inclined, the center of buoyancy B moves to B' because of the change in the shape of the displaced water. The force of buoyancy then acts vertically upward through B' . If this line cuts the center line of the ship at a point M above the center of gravity G , the two forces produce a couple tending to rotate the ship back to the upright and the ship is said to be in stable equilibrium. If the vertical through B' cuts the center line below G the couple that is formed rotates the ship further away from the upright and the ship is said to be in unstable equilibrium. The point M is called the transverse metacenter. It is not a fixed point except for small angles of inclination, up to about 15° for ships of normal underwater form. The distance GM is called the transverse metacentric height or simply the metacentric height of the ship. It is the criterion used for visualizing broadly a ship's initial stability and behavior when inclined from the upright and for comparing one

ship with another in respect to initial stability. Longitudinal stability lends itself to similar analysis with rotation taking place around the athwartship axis of the ship, but as such stability is never critical in ships of normal form and use, no further discussion of this aspect of stability is necessary in this article.

For larger angles of inclination the position of the metacenter M moves downward until an angle of heel is reached where it falls below the center of gravity. The ship is then unstable and any further inclination will lead to capsizing. Calculations are made to determine the righting moments at the various angles of inclination. These are plotted as ordinates in terms of righting arms (GZ in the diagram) against angles of inclination as abscissae, thus producing a curve which shows the full range of stability of the ship and the inclination at which the righting moment (actually the righting arm GZ) is at its maximum and finally becomes zero. The description of the calculations necessary for producing this curve is too complicated and space consuming for inclusion in an article of this kind.

Many factors affect the actual stability and the range of stability of ships such as the location of the center of gravity; draft and form of underwater hull; loading, and freeboard. For example, ships with a high freeboard have a long range of stability through which they can be inclined without danger of capsizing. The range of stability is seldom made less than 50° and for vessels with high freeboard may be as much as 100° . It is the business of the naval architect to provide such stability in the design that the vessel will be safe and seaworthy in all weather if handled with ordinary skill and if the loading is as prescribed.

For safety alone it is not necessary for the metacenter to be above the center of gravity when the ship is upright. A ship can be so designed that with the metacenter slightly below the center of gravity it will list a few degrees to one side or the other until it reaches an inclination at which the metacenter arises above the center of gravity. The ship will remain in the slightly listed position if in still water and if no change in the distribution of weights on board is made. If the vessel has a high freeboard and a long range of stability such a vessel may be entirely safe and seaworthy. Atlantic liners were at one time deliberately designed with little or no initial metacentric height in order to give them an easy and slow rolling motion.

Structural Strength.—In addition to making provision for adequate buoyancy and stability the naval architect must also design ships with sufficient strength to withstand all of the stresses to which they may be subjected in service. The greatest stresses are those which result from the interaction of the forces of gravity and buoyancy causing the ship to bend as a beam. The distribution of the weight of the ship and its contents and the support of buoyancy along its length are not uniform even in still water. When the ship encounters waves at sea the uneven distribution of weight and buoyancy is accentuated many fold.

Under these circumstances two extreme situations may arise: one with the ship supported at mid-length on the crest of a wave; the other with the ends supported on the crests of waves and with the trough of the waves amidship. An assumption must then be made as to the height of the waves because upon this are dependent the bending stresses to which the ship will be subjected. Some naval architects assume that under the most adverse cir-

cumstances the height of the waves will not be greater than $\frac{1}{20}$ th of their length, the maximum length of storm waves being pretty well known.

Others assume a height equal to $1.1\sqrt{\text{wave length}}$. It is, however, impossible to foresee all combinations and contours of waves that may be encountered in a storm, thus there is always some uncertainty as to the magnitude of the forces that may be involved. The actual calculations follow the same lines as those for loaded beams under various conditions of support. In addition to the girder stresses to which ships are subjected there are transverse and paunting stresses; concentrated stresses due to heavy local weights such as machinery, armor, and guns; the battering effect of waves, and the stresses that are imposed on the structure in docking or grounding.

Practical experience must come to the aid of theory in deciding on the structural strength needed to resist these forces, because of uncertainty as to their magnitude in many cases. In general, if the design under consideration is not too dissimilar from previous designs that have shown no weakness in service the naval architect can feel reasonably certain of the adequacy of the new design. The accumulated experience of navies and of the merchant service is of great value in confirming or modifying the theoretical considerations, but when novel types or sizes of ships beyond precedent are involved, the skill and judgment of the architect are taxed to the utmost in estimating the various stresses that may be encountered. The normal reaction of the classification societies and marine underwriters is to go slow and to play safe in departing from standard practice. Naval architects, shipbuilders, and ship owners are more likely to be interested in progress and improvements. A long period of discussion is likely to ensue when novel designs or changes in practices are proposed, but with the accumulation of experience the doubtful questions adjust themselves.

Rolling and Pitching.—The action of waves set up rolling, pitching, and other oscillations of a complex nature in ships at sea. Of these, rolling is normally the most important. All such motions are related in a large measure to the stability characteristics of the ship. When a vessel is floating in disturbed water the location of the center of buoyancy is changing constantly, thus causing the vessel to depart from the upright. The force of gravity operating through the center of gravity of the ship is at the same time acting to return the ship to the upright. In the process the ship acquires angular velocity and swings beyond the upright, then a righting moment in the opposite direction comes into play to restore the ship again to the upright, thus rolling begins. In the absence of waves or other disturbances the friction of the water quickly brings a rolling ship to rest.

There are a number of factors that influence rolling. In general, vessels of large metacentric height roll quickly, those of small metacentric height have a sluggish rolling motion. When floating among waves which are large as compared to the vessel, the ship of great metacentric height tends to float like a board, keeping its deck practically parallel to the surface of the waves. The vessel of small metacentric height will, under such circumstances, at times roll toward the wave crest instead of away from it, a very undesirable condition with low freeboard vessels. In practice, vessels vary widely in their periods of oscillation. For large vessels the shortest period from the extreme on one side to the extreme on the other is of the

order of three seconds and is encountered in low freeboard warships such as monitors; this because such ships have a large metacentric height. A large vessel of small metacentric height may take as much as ten seconds for a single roll from side to side.

For small angles less than about 15° rolling is practically isochronous, that is, the time taken for a complete roll varies little with the angle. This ceases to be true when larger angles are reached. If there were nothing to retard rolling, ships that are otherwise perfectly seaworthy might reach capsizing angles when among waves whose period coincides with that of the ship because each passing wave would add a little to the amplitude of roll, just as large oscillations can be imparted to a swinging weight by applying to it small but properly timed impulses. The skilled seaman can do much to limit excessive rolling by changing course sufficiently to break up synchronism. The risk of capsizing due to rolling alone is, therefore, not very great.

Rolling even when not excessive is objectionable for a number of reasons. For one thing, the traveling public objects to rolling because it causes seasickness. Next to the common cold, seasickness is probably responsible for more human misery than any other of man's minor ailments. Heavy rolling may result in damage to the ship and to the cargo, as well as injury to the personnel on board. In warships, heavy rolling interferes with accurate gunfire. In all ships rolling of any magnitude is objectionable because it is an operating handicap. For these reasons naval architects have given much thought to antirolling devices. The devices that are or have been employed either in actual service or experimentally to reduce rolling are (1) bilge keels; (2) antirolling tanks; (3) gyroscopic stabilizers; (4) moving weights, and (5) stabilizing fins.

Bilge keels are fins attached to the bottom of the ship at the turn of the bilge. Their longitudinal extent varies from 25 to 75 per cent of the length of the ship and their depth from approximately 1 foot to 3 feet depending on the size and type of ship. Ever since their effectiveness in reducing rolling was first demonstrated, around 1870, bilge keels have been fitted to nearly all ocean-going vessels, both commercial and naval. If properly proportioned and fitted, they reduce the maximum angle of roll to less than one-half of what it would be without them. They also slow down the period of rolling. Their effectiveness increases with the speed of the ship.

The earliest installation of antirolling tanks was made in about 1874. Broadly speaking, this device consists of tanks opposite each other at the sides of the ship, connected at the bottom by a tunnel, or large pipe, through which water flows from side to side as the ship rolls. In some installations the shifting of the water is accelerated and controlled by pumps. Such installations are particularly suited to icebreakers, as bilge keels cannot be used on such ships. In all cases the shifting of water or other liquids from side to side if properly timed resists the righting moment of the ship and thereby dampens the rolling. Gyroscopic stabilizers have advantages as well as disadvantages compared to other devices. Some of the disadvantages are high cost, weight, delicacy of adjustment, and the power required for their operation. Gyroscopic stabilizers have been installed on many yachts and on some large ships, the largest being a ship of about 41,000 tons displacement. The

experience on this ship was that it reduced the angle of roll about 44 per cent when the free roll away from the vertical was as much as 5° . The weight of the installation came to about 700 tons. Retractable stabilizing fins that can be moved in and out at will and controlled from within the ship are recent antirolling devices. They have achieved a considerable degree of popularity, both for certain types of warships and for passenger ships.

Speed and Resistance.—To the layman the most interesting fact about ships is usually their speed. The keen interest taken by the general public in the speed records of transatlantic passenger liners illustrates this point. The methods in use at present for determining the power required to drive ships at desired speeds and the underwater forms best suited to economical propulsion are comparatively recent developments in naval architecture. They are based on the scientific research during the last half of the 19th century of William Froude, an English engineer, and of his son R. E. Froude. These methods were later carried to a high state of perfection in the model basin at Washington, D.C., by the late Rear Admiral David W. Taylor, Construction Corps, United States Navy.

The principles underlying these methods are that the resistance of a ship in moving through water at a given speed is made up of three factors, first, the skin friction between water and the surface of the ship. This is dependent only on the nature of the surface as to smoothness, the wetted area, and the speed of the ship. It varies slightly with variations in the form of the ship because such variations affect the velocity of the water over the hull, but in general this variation is too slight to be of importance in practice. The second element is wave-making resistance, and is due to the waves that are formed by a ship moving through the water. Power is required to produce these waves and must come from the power driving the ship. The third element is eddy-making resistance, and is due to the eddies formed in the water behind square corners of the hull and attachments, such as sternposts or propeller struts.

The skin friction component can be calculated with considerable accuracy from experiments on the frictional resistance of plane surfaces towed through water at known speeds. Froude demonstrated that the remaining resistance (wave and eddy-making) of a full-sized ship could be calculated with considerable accuracy from careful determination of similar resistance of a small model of the ship when towed at a speed corresponding to the desired speed of the ship, the corresponding speeds of model and ship being in the ratio of the square roots of their linear dimensions. For a ship 500 feet long, for example, and a model 20 feet long, the ratio of linear dimensions is 25; so that the actual speed of the model corresponding to 20 knots for the ship, would be $20 \div \sqrt{25}$, or four knots. Model experiments lend themselves to comparatively inexpensive and rapid investigations of the effect on speed and power due to changes in shape and dimensions which would be impracticable if attempted on full-sized ships. The principles followed in passing from models to full-sized ships can also be applied in passing from one full-sized ship to another, provided the two ships are similar, or nearly so.

Model Basins.—Model basins thus became the principal tools of the naval architect in designing ships. They are found in practically all shipbuilding countries of the world. There are at present some thirty-five model-testing stations with a total

of forty-eight basins. The first model basin was built by William Froude, in Torquay, England, in 1872. One of the earliest and the most advanced basin for its time was the one designed and built by Naval Constructor David W. Taylor for the United States Navy in Washington, D.C. in 1899. A new station was completed and put in operation by the U. S. Navy in 1940 at Carderock, Maryland, a few miles outside of Washington. It was named the David Taylor Model Basin to commemorate Rear Admiral Taylor's world renowned work in this field. This station has four separate basins—one for the normal testing of ship models in deep water, a second for testing models of ferry-boats, towboats and barges in shallow water, a third for testing models of high-speed craft, such as motorboats, patrol boats and coastal torpedo boats, and a fourth for testing special models and for conducting extended research which cannot be worked into the normal busy schedule of the large basins.

The main basin was originally 963 feet long but was extended in 1945 and 1946 to a length of 2,775 feet. Its width is 51 feet and its depth 22 feet. Two model towing carriages span this basin having speeds of 15 and 18 knots respectively. Models up to 32 feet in length and displacement up to 10,000 pounds may be towed in this basin; the standard model length is about 20 feet. The shallow water basin is about 250 feet long and 51 feet wide. Its depth can be varied to suit the test being conducted, from a maximum of 10 feet down to a minimum of a few inches. A turning basin formed like the letter J at one end of the shallow water basin makes it possible to study the behavior of models up to 20 feet long when making turns up to about 180°.

The high-speed model basin is 2,968 feet long. It has two carriages capable of being operated at 40 and 60 knots respectively. It is 21 feet wide, 10 feet deep, for a length of 1,160 feet, and 16 feet deep for the remaining length. The small model basin is 142 feet long, 10 feet wide, and 5 feet 6 inches deep. Models in this basin have a length not exceeding 5 or 6 feet. They are towed by what is known as a gravity dynamometer, actuated by a falling weight, or by a special device, depending upon the test. There is at Carderock a circulating water channel built for flow studies and special investigations on ship models, in which the model floats stationary in a moving stream of water. This channel is 22 feet wide, 9 feet deep, and the moving water in it has a maximum speed of 10 knots.

The towing models in the cold weather countries of northern Europe are generally made of paraffin wax, which is cast in a mold roughly representing the shape and scaled-down dimensions of the hull of the ship. In the warmer countries of Europe, such as Italy, and in the United States, the towing models are normally made of wood. Recently a wax compound has been developed that will retain its shape under higher temperatures. Both the wax and the wood models are roughed to shape in special machines and are then finished by hand. All large model basins, both in the United States and abroad, are equipped with self-propulsion dynamometers, for fitting in or on the model, by which the ship models are made to drive themselves along the model basin. An electric motor, combined with devices to measure thrust, torque, and revolutions, is connected by a shaft passing through the model to a small propeller representing the design proposed for the ship.

Using the data obtained from the towing and the self-propulsion tests of the model, it is possible to determine not only the effective horsepower necessary to tow the full-sized ship but the horsepower which the propelling machinery must develop, taking into account the mechanical friction losses between the engine and the propeller, as well as the hydraulic loss in the propeller itself. The ratio between the effective horsepower as

defined above and the horsepower developed by the propelling machinery (indicated horsepower for reciprocating engines, brake horsepower for Diesel engines, and shaft horsepower for turbines) is called the propulsion coefficient. It ranges from about .6 to .8 and depends on the friction in the machinery and shaft bearings, on the efficiency of the propellers, on the shape of the stern of the ship, on the flow of water to the propellers, but mainly on the number of propellers used to drive the ship.

With four propellers driving the ship the propulsive coefficient is about .6, with two propellers it is about .7, and with a single propeller the coefficient is about .8. This range of values represents fair, average practice obtained in well-designed modern vessels. Lower values than these are usually due to difficult service requirements, inefficient hull design, unsuitable propellers, or a poor selection of machinery. While single screw ships show the highest propulsive efficiency, the limit of power which can be developed by a single screw is constantly being increased. In addition, there are other reasons for preferring multiple screws to a single screw—such as greater security against complete breakdown at sea, better maneuverability, and the advantage of being able to subdivide the propelling machinery between several compartments—this being particularly important in warships to guard against complete disablement from a single lucky hit.

Influence of Materials.—As naval architecture has been largely influenced by the materials used in ship construction, brief allusion to these materials seems appropriate. The material used in the construction of ships underwent, broadly speaking, two changes during the 19th century: a change from wood to iron, which dates from approximately the middle of the century, and a change from iron to steel, which dates from about 1880. Wood is still used as the principal material for building small vessels, such as yachts, motorboats, small tugs, and barges.

The material now generally used for ship construction is a plain carbon steel, frequently called medium steel, which in a standard test specimen exhibits an ultimate tensile (or breaking) strength of approximately 60,000 pounds per square inch of cross-sectional area and an elongation (or stretch) of 25 per cent of the original length of the test section of the specimen. Such steel was not produced in the United States in commercial quantities until 1883 when it was specified for the ships of what was then called the New Navy. With the demand for weight saving in warship construction as well as in the construction of high-speed passenger liners, steels of higher tensile strength and better all-round properties than medium steel have been developed. Such steels are more expensive than medium steel, but have made it possible for the naval architect to produce ship designs that would not have been practical with medium steel. However, medium steel is still the most extensively used grade for hull construction except when more strength for the same weight, or the same strength for less weight, is desired, especially in warships, in which case higher strength steels are used in the most highly stressed locations, such as the upper decks, the sheer strakes, the flat keel, and certain other portions of the hull plating and structure.

The high tensile steel most commonly used in warship construction is one having an ultimate tensile strength of 70,000 to 90,000 pounds per square inch and an elongation of 22 per cent. This steel contains not over .18 per cent carbon and up to 1.30 per cent manganese (as compared with .31 per cent maximum carbon and .75 per cent maximum manganese in medium steel), and usually contains small percentages of silicon, vanadium, and titanium. This alloy, and various other alloys offered commercially as high tensile steels, are often used in the construction of merchant ships.

In warship construction, a steel known as special treatment steel (STS), which is specially heat treated during manufacture, was developed for its ballistic qualities and has been used as armor protection. This steel usually contains about 3 per cent nickel, or equivalent alloying elements, and, in addition to its ballistic properties, exhibits a tensile strength above 100,000 pounds per square inch and over 27 per cent elongation. STS is being used in increasing quantities in warship construction in the dual role of hull plating or decking and for its ballistic protection, but has not been used extensively for merchant ship construction. A steel known as HY80 containing about 2 per cent nickel has come into use for merchant ships where strength and weight saving are of particular importance.

Aluminum alloys are used extensively on warships as well as merchant ships for upper works, stateroom bulkheads, furniture, and certain doors, because of the great weight saving that can be effected thereby. Chromium-nickel stainless steels are used where strength or corrosion resistance, or both, are governing considerations. This latter kind of steel must, however, be used with caution because under certain conditions of exposure to

salt water it is no more corrosion resistant than medium steel.

Welding.—The progress of welding has had a marked effect on naval architecture both in the design of ships and in the selection of materials. The use of welding, in place of riveting, in hull construction has effected considerable weight savings by eliminating plate overlaps, butt straps and rivetheads. It also effects savings in time and often in cost. The problem of achieving water and oil tightness has been greatly simplified. As a consequence, 100 per cent welded hulls in merchant ships and the smaller classes of warships (destroyers and smaller) are becoming the rule rather than the exception, and welding is displacing riveting more and more in the largest warships and merchant ships. Welding is also being used in other parts of ships. Piping is extensively welded, and many parts, such as stems, sternposts, shaft struts, and machinery foundations, formerly made as castings or forgings, are being fabricated by welding together formed plates or shapes, sometimes combined with smaller forgings or castings. Welding has made it possible for the naval architect to place the metal where it does the most good.

While welding has many advantages, it has also introduced new problems or focused attention on old, sometimes unrecognized problems. To realize the full benefits of welding, the design must be such as to take advantage of prefabrication of subassemblies and so that erection will take place in the proper sequence to avoid distortion and locked up stresses. Design must also allow adequate access to all joints for proper welding, and must be governed by the properties of the materials which it is necessary to use to ensure weldability. In most instances the materials best suited to ship construction can be utilized. Weldability can be assured by specifying more closely the carbon and other composition limits of the material.

Two closely related and important factors on which welding has focused attention are notches and notch-sensitivity of structural materials. Welded ship design must pay more careful attention to the avoidance of sharp corners or other abrupt changes in section, which constitute notches and disturb the uniform distribution of stresses, than was necessary in riveted designs. Provision must also be made for the exclusion of notch-sensitive materials, since such materials do not readily stretch and deform to redistribute concentrated stresses, but instead often start to crack at a notch even when the external loads are little more than normal. Notch-sensitivity is intensified by low temperatures.

The replacement of wood by iron and other metals as shipbuilding materials and the substitution of steam for sail to drive ships exercised a particularly great influence on naval architecture because these changes made it possible to increase the size of ships. These developments necessitated also the use of scientific methods wherever possible in designing ships. The tendency toward an increase in size has been very marked since 1885, so that now ships have reached dimensions which are limited only by the draft of water in channels and in harbors, by the docking and wharf facilities available in the ports to which they trade, by the size of drydocks in which they must be placed for painting and repairs, and by the width of canal locks through which they must pass.

Subdivision.—In the field of naval architecture as distinguished from shipbuilding, one of the most important advances has been the improvement in the design of merchant ships, particularly in passenger ships, to make them less vulnerable to sinking or capsizing after sustaining collision or war damage. Providing protection against the hazards of sinking or capsizing as the result of battle damage has always been a major consideration in the design of warships, but the problem there has been somewhat different from that of merchant ships because the question of cost is secondary in the case of warships, and earning a return on the investment is not involved.

If the underwater shell of a ship is torn open by a collision, or other cause, that portion of the ship to which the sea has access will fill with water to the level of the sea outside. The effect on the ship as a whole will be twofold: (1) The ship will settle bodily into the water by an amount which will depend on the quantity of water entering the ship. At the same time, unless the flooded compartments are located amidship, the ship will trim by the head or by the stern, as the case may be. The effect will be to reduce the distance above

water of the deck to which the watertight bulkheads are carried. If the sinkage is such as to bring this deck below the level of the sea, water will enter adjacent undamaged compartments by flowing along this deck and will cause progressive flooding until the ship founders through loss of buoyancy. (2) The flooding of one or more compartments will, in general, change the transverse stability of the ship. The mathematical proof of this statement is too lengthy for an article of this kind. Suffice it to say that the net effect of flooding one or more compartments may be either a gain or a loss in metacentric height, depending on the proportions of the ship and the length of the flooded spaces. If there is a loss of metacentric height, the ship may become unstable and take a severe list or even capsize.

The foundering of a ship, owing to sinkage and trim, is usually a relatively slow process, often taking several hours, but capsizing, owing to instability, if it occurs, is likely to be sudden. For example, the S.S. *Titanic*, after sideswiping an iceberg, remained afloat for about three hours, although the starboard side was torn open for a distance of about 300 feet. On the other hand, the S.S. *Empress of Ireland* capsized and sank in 15 minutes, and the S.S. *Lusitania* capsized and sank in 20 minutes. If war damage, instead of collision damage, is sustained, loss of the vessel may follow the damage by only a few minutes, whether from foundering or capsizing. In both World Wars there were, however, instances of ships remaining afloat many hours and even days after being hit by torpedoes. This was the experience especially during World War II with ships built under the sponsorship of the Maritime Commission.

The prevention of either foundering or capsizing lies in fitting transverse bulkheads so spaced that (1) leakage water will be confined to an amount which will not sink or trim the ship sufficiently to immerse the tops of watertight bulkheads, and (2) the lost water plane will be confined to an extent which will not cause sufficient loss of metacentric height to result in an excessive angle of heel.

Naval architects in all countries recognized at an early date that ships could and should, by appropriate watertight subdivision, be made safer against sinking than was the current practice, but as shipping is internationally a highly competitive business, no nation by itself could require radical departures along these lines in the design of its ships without detriment to its shipowners, because from the operating point of view, closely spaced bulkheads interfere with cargo handling and stowage, with passenger accommodations, and with machinery arrangements, not to mention a higher original investment because of the greater cost of building such ships. In the extreme case, if bulkheads were spaced very closely together, the ship might be rendered entirely useless as a commercial investment. On the other hand, a ship with no transverse bulkheads would be unable to survive any leakage beyond that which could be handled by the pumps. Somewhere between these two extremes lies the best design. The history of improvement in the watertight subdivision of merchant ships is an interesting study. It is the history of marine disasters and of the repercussions of such disasters on the public and on the legislative bodies of governments. These have finally required shipowners to provide certain minimum watertight subdivision in ships carrying passengers beyond 12 in number.

The classification societies and marine underwriters at an early date required the fitting of a peak or collision bulkhead. Regulations with regard to loading and reserve buoyancy were also established many years ago and have already been mentioned. When screw propellers replaced paddle wheels, an afterpeak bulkhead became an obvious necessity to prevent leakage through the stern tubes from flooding the ship. The fitting of a double bottom in larger ships, that is, an inner skin in the way of the large compartments, such as machinery spaces and cargo holds, was soon adopted as the best way of protecting ships against the effects of flooding caused by striking submerged objects or by grounding. There was, however, considerable reluctance on the part of shipowners to add anything more in the way of transverse bulkheads, except as needed for strength and other structural reasons, because of the operating disadvantages mentioned above.

In 1866, the British passenger ship *S.S. London* sank with a loss of 233 persons. After investigation of the accident, the British Institution of Naval Architects recommended that all ships should be so constructed that they would remain afloat with one compartment open to the sea, and that passenger ships should remain afloat with two adjacent compartments open to the sea. This society had, however, no powers to place its recommendations into effect. In 1882, Lloyd's *Register of Shipping* incorporated subdivision requirements in its rules for the first time, and specified that ships more than 280 feet long were to have transverse watertight bulkheads, the number required increasing with the length of the ship. In 1890, the British Board of Trade suggested the first scientific approach to the question of spacing transverse bulkheads by calling attention to the fact that a curve of floodable length could be plotted for each ship, which would make it possible to determine, by making certain assumptions, the maximum length of the ship which could be flooded without causing the ship to sink when damaged at any particular point. In 1895, the German steamship *Elbe* sank with the loss of 335 passengers, which fact led the Society of German Shipowners to issue subdivision regulations based on floodable length. These regulations divided merchant ships into two classes: primarily passenger ships and primarily cargo ships. The regulations called for different degrees of subdivisions for the two classes, but there was no general acceptance of these regulations.

The disaster which finally impressed on the public, on shipowners, on insurance societies, and on governments the necessity for better subdivision of ships was the sinking in the north Atlantic, on her maiden voyage in April 1912, of the *S.S. Titanic*, with the loss of 1,513 lives. After a preliminary investigation of the disaster by the British Board of Trade, the British government invited an International Conference on Safety of Life at Sea to meet in London in 1913. The conference agreed on certain fundamentals and on curves for defining the minimum and maximum subdivision for the two extreme classes of ships mentioned above. The convention was signed in January 1914, but owing to the World War, which started in July 1914, none of the signatory nations put the regulations fully into effect. After the war, British shipowners engaged in replacing war losses, contended that the subdivision requirements of the 1914 conference for ships primarily of the cargo type and carrying few passengers were too severe and requested relaxation of the rules by the

Board of Trade. After a conference between British and American representatives in Washington in 1920, it was agreed to relax the requirements for the cargo type of ship. At an international conference in 1929 agreement was reached on many of the moot questions. After the loss of the *S.S. Morro Castle* by fire in 1934 and the *S.S. Mohawk* by collision in 1935 the United States Senate appointed a committee to investigate ship safety for United States vessels. This committee recommended in Senate Report 184, 1937, higher standards for subdivision, fire protection, stability in damaged condition, and other matters affecting the safety of ships at sea. The International Conference on Safety at Sea held in London in 1948 adopted a convention to replace the 1929 convention which includes some of the recommendations of the senate report. Ships flying the American flag and, therefore, subject to United States Coast Guard inspection are required to meet standards that are actually higher than called for by the 1948 convention as they include many of the requirements of Senate Report 184.

The decision as to the number and spacing of watertight bulkheads to insure the maximum chance of survival of a ship in case of collision would, on first thought, seem to be a simple one. Actually, it is very complicated and becomes, in the last analysis, a compromise as have so many other decisions in naval architecture. There are two opposed points of view in this matter: one is that the bulkheads should be spaced as far apart as is possible while still permitting the flooding of the predetermined number of compartments; the other is that the closer the bulkheads are spaced, the safer the ship (leaving out of consideration the operating disadvantages in close spacing already mentioned above). At the international conference, the latter point of view prevailed; namely, that there is continually increasing safety with decreased bulkhead spacing. Instead, however, of prescribing one-, two-, or three-compartment subdivisions with the bulkheads spaced as far apart as possible within each grade or subdivision, the convention gave a permissible length of compartment, which is obtained by multiplying the floodable length by a factor less than unity or as a limit equal to unity, called the *factor of subdivision*. In order to describe briefly the subdivisional characteristics of ships, the terms *one-compartment ship*, *two-compartment ship*, *three-compartment ship*, etc., were adopted, meaning that when any two adjacent compartments of a ship can be flooded without submerging the vessel below the margin line (a line 3 inches below the uppermost deck to which the transverse bulkhead are carried), it is termed a two-compartment ship; when three adjacent compartments can be so flooded, it is termed a three-compartment ship, etc. Obviously, the maximum flooding is coupled with the minimum damage when such damage occurs where a bulkhead meets the side of the ship. If the damage does not come at a bulkhead, then the greater the distance between bulkheads, the greater the permissible damage which will flood only one compartment.

For the reasons already stated, these standards were not made compulsory on ship operators, but, in the case of the United States, the Bureau of Marine Inspection and Navigation of the federal government, which has jurisdiction over such matters, adopted many of them, especially the ones having to do with fire prevention and extinction. The Maritime Commission went a step further in its designs by exceeding many of the requirements of the international agreements. For example, all new cargo vessels under its jurisdiction, such as the Liberty ships, were required to have not less than a one-compartment standard of subdivision. A vessel is said to be a one-compartment ship when it can survive flooding of any one of its main compartments, throughout a large part of its operating range under normal loading conditions.

It is difficult to evaluate the exact effect which design policies and practices have on any complicated engineering product such as a ship, but the following data are interesting as indicative of at least the broad general influence of the "safer ships" design policy adopted by the Maritime Commission. During World War II, 758 merchant vessels operating under the War Shipping Administration suffered war damage. Of this number 467 did not have Maritime Commission sponsorship in design. Of these 467 ships, 80 per cent sank as the result of the damage received. Of the 291 ships which were built in accordance with Maritime Com-

mission subdivision and other safety at sea practices, only 53 per cent sank as the result of damage received. There were at least six of these ships whose survival can be ascribed definitely to the compartmentation policy adopted by the Maritime Commission. It was clearly established also that ships built to these standards remained afloat longer than ships not so designed even when they sank eventually, thus providing more time for the personnel to abandon ship.

The whole problem of bulkhead spacing is also complicated by the kind of cargo which happens to be in the compartment at the time of flooding. To arrive at any conclusion in the matter, an assumption must be made as to the permeability of each compartment. By *permeability* is meant the extent to which leakage water can permeate flooded spaces. It is expressed as a percentage of the total volume of the space under consideration. For example, an empty hold can take nearly its entire volume of sea water. The permeability of such a space is, therefore, about 98 per cent. On the other hand, a ballast tank already entirely filled with water can take no more water; therefore, its permeability is zero. Spaces used for various purposes may have any degree of permeability between these two extremes. A hold filled with canned goods in cases has a permeability of about 30 per cent; one filled with furniture in boxes, about 80 per cent. It will be seen that the effect on the ship, as a whole, of flooding a given space will depend on the amount of water which enters this space, which in turn will depend on its permeability. Hence, before the effects of flooding can be calculated, definite values for the permeability of the spaces involved must be assumed, but the actual permeability in service cannot be known by the naval architect for all conditions, as it may vary considerably from voyage to voyage, depending on the amount and kind of cargo carried. In the last analysis, mathematics can take the naval architect only part way in arriving at the best solution for the subdivision of ships, after which, judgment and a suitable compromise of the conflicting considerations must do the rest. NAVAL AUXILIARY VESSELS. The term *naval auxiliary vessels* has had various meanings in the past and has, in fact, not always meant the same type of ship in all navies. In the days of wood and sail, all naval vessels were in a sense combatant ships, possibly with the exception of store ships. Auxiliary vessels to accompany the fleet were not necessary, because each unit of the fleet was self-sustaining. With the advent of steam and finally of modern weapons and specialized fighting craft, such as submarines and destroyers, a number of types of auxiliary vessels had to be

provided which were not essentially fighting craft, but were necessary to keep the combatant ships in efficient fighting condition. The earliest of the auxiliary types were fuel ships, store ships, transports, and ammunition ships. With the advent of submarines, it was found necessary to provide submarine tenders because of the poor living conditions at that time on the submarines themselves. To avoid the necessity of frequent visits to navy yards, these tenders were also equipped with repair facilities to assist the personnel of submarines in making minor repairs to machinery. Submarine tenders were found so valuable in this respect that destroyer tenders and repair ships were soon added. In order to assist the fleet in self-maintenance still further, large repair ships are now important units of every fleet. Hospital ships (q.v.) complete the list of ships that are normally classed as auxiliaries. All of the above-mentioned types resemble merchant ships more than they do men-of-war. In fact, such ships have often been converted in the past from merchant ships. While naval auxiliaries, except hospital ships, carry some armament—mainly for defense against submarines and aircraft—their primary mission is not that of fighting ships. In some navies, minesweepers, minelayers, patrol craft, and armed merchant ships functioning as cruisers are also classed as naval auxiliaries.

In order to leave no ambiguity as to what constitutes a naval auxiliary vessel, the 1936 London Naval Treaty defined such craft as follows:

"*Auxiliary Vessels* are naval surface vessels, the standard displacement of which exceeds 100 tons (102 metric tons), which are normally employed on fleet duties or as troop transports, or in some other way than as fighting ships, and which are not specifically built as fighting ships, provided they have none of the following characteristics: (a) mount a gun with a caliber exceeding 6.1 in. (155 mm.); (b) mount more than eight guns with a caliber exceeding 3 in. (76 mm.); (c) are designed or fitted to launch torpedoes; (d) are designed for protection by armor plate; (e) are designed for a speed greater than twenty-eight knots; (f) are designed or adapted primarily for operating aircraft at sea; (g) mount more than two aircraft-launching apparatus."

While the treaties limiting naval armaments, including the 1936 London Naval Treaty, are no longer in effect, the above definition of auxiliary vessels is of interest as it gives the limit in protection, armament and speed, beyond which, in the opinion of the naval experts who drafted the treaty, a noncombatant ship becomes essentially a fighting ship. See also NAVAL STRATEGY AND TACTICS.

Rear Admiral, United States Navy (Retired).

NAVAL AVIATION. As an idea, naval aviation dates in the United States from the day in September 1908 when naval officers, observing the tests of the Wright brothers at Fort Myer, Va., suggested the addition of pontoons to their plane for waterborne use. As an actuality, it dates from Nov. 14, 1910, when Lieut. Eugene Ely successfully flew an airplane from a rudely constructed platform on the bow of the U.S.S. *Birmingham* at Hampton Roads, Va. In January 1911, he landed on and took off from the deck of the U.S.S. *Pennsylvania*. A month later, Glenn Curtiss flew in his hydroplane to the waters alongside the same ship, was hoisted aboard and placed back in the water, where he made a successful takeoff.

In the same year, the first naval aviation unit was formed, a training organization so mobile it could move its camp from place to place without difficulty. By the outbreak of World War I, navy fliers had established a number of world records and had demonstrated the ability of their craft to perform usefully with the fleet, given special pilot training. By November 1918, the handful of naval aviators had grown to 7,000 officers and 30,000 enlisted men. The navy had 54 naval air establishments, over half of which were overseas.

The mission of naval aviation in World War I was primarily patrol and antisubmarine activity. Airplanes could not fly across the ocean, and as they increased in size and as shipping space shrank, transporting them became a serious problem. This led to the development of the big NC flying boats, capable of making the ocean flight on their own. On May 8, 1919, four of these planes took off from Newfoundland for Lisbon. Several days later, one of them, the NC-4, became the first airplane ever to fly across the Atlantic.

Despite drastic disarmament following the war, naval aviation in the United States expanded and assumed a more integrated role in operation with the fleet than its specialized antisubmarine assignment of the war. Civilian and military scientists improved the flying boats in range, strength (for rough-water landings and takeoffs), and speed, but still they were tied to shore bases by the necessity for fueling and maintenance. It became manifestly necessary to obtain aircraft which could operate directly from ships out at sea. The catapult, which had been proved feasible during the war, was installed on all the cruisers and battleships of the fleet for launching planes at sea. This device, which functions like a giant slingshot, uses compressed air, hydraulic pressure, gunpowder or electricity, and ultimately was developed to accelerate a piloted plane from zero to 90 miles an hour in the space of 150 feet. The battleships and cruisers also had small complements of float planes for scouting and observation.

Development of Carrier Aviation.—However, out of the experiments of Lieutenant Ely on the *Pennsylvania*, there was developing a more satisfactory way of carrying airpower to sea. England was in the lead in this project for a time and in 1918 converted a cargo ship into the first satisfactory carrier with a full flight deck for landing and takeoff of airplanes. Four years later the United States converted the collier *Jupiter* into the carrier *Langley*. The Japanese had completed the small new carrier *Hosyo*.

This new type of ship made it possible for small and medium-sized aircraft, of higher performance and greater maneuverability than the flying boats, to accompany the fleet anywhere and operate almost independently of the weather. Specially designed to carry planes, the carriers could develop enough speed of air across the flight deck to furnish the necessary lift for takeoffs, even when the wind alone was not strong enough. The landing-run was shortened by use of a tail hook on the plane which engaged in a mesh of arresting gear on the deck. Elevators were constructed to carry the planes from the flight deck down to the repair and maintenance facilities below in the hold.

Navy airplanes increased in variety as well as numbers, but always in three main types:

Carrier-based Planes.—These were developed to offset the drawbacks of flying boats, which could not always keep up with the fleet, and of catapulted seaplanes which were comparatively low in performance and weak on the offensive. The carrier planes consist of three types: (1) highly maneuverable little fighters which give protection to ships against enemy air attack, as well as escort attacking groups of heavier planes; (2) larger torpedo planes, with crews of three, which deliver either torpedo or horizontal bombing attacks; (3) scout bombers, also known as attack bombers, which operate on long-range scouting expeditions or in the navy-developed maneuver known as dive-bombing.

Flying Boats.—Originally designated two-purpose planes for patrol and bombing work, these later became almost exclusively used by the navy for long-range scouting work. Weighing up to and even more than 60,000 pounds, with wing spans of over 100 feet, they carry crews of 5 to 10 men, and operate either from shore bases or aircraft tenders which permit use of any reasonably sheltered water as a base.

Seaplanes.—These are constructed with a single main float and auxiliary wing-tip floats to lend stability on the water. They are based on cruisers and battleships, which launch them by catapult and retrieve them from the water with cranes after landing. Seaplanes based on capital ships add much to their effectiveness, widening the scouting range by hundreds of miles and increasing the accuracy of their gunfire by "spotting" the results from the air.

In addition to these three main types, naval planes always include amphibious aircraft, used largely for rescue work, and land-based transport planes.

In the lighter-than-air field, the navy during World War I utilized small nonrigid airships, called blimps, in Atlantic coastal, Gulf of Mexico, Panama, and western European waters, on antisubmarine patrol and escort duty. Kite balloons were widely used at shore bases and on U.S. battleships as lookout and gunfire-spotting platforms.

In the early 1920's, the United States Navy promulgated a program for three rigid airships, one each to be built by Britain, Germany, and the United States. America's *Shenandoah* operated successfully as a naval unit for two years, then was wrecked in Ohio in September 1925. The British-built ZR-2 was wrecked at Hull, England, during trials. The German-built *Los Angeles* was operated successfully as a naval noncombatant unit from 1924 to 1931, when she was decommissioned for lack of funds.

The *Akron* and the *Macon*, two United States airplane-carrying scouting airships, were built in the early 1930's. Each was of about 200 tons displacement, about two and a half times that of earlier ships. They operated successfully with the fleet for a year and a half and then each was wrecked.

With the advent of World War II, the lighter-than-air arm of the United States Navy was built up extensively, for antisubmarine escort and patrol. At its wartime peak, the blimp fleet of 120 was deployed on all United States continental coasts and in Caribbean, South American and Mediterranean waters; 30 more blimps were in use for training, and airship crews numbered 1,500 officers and 3,000 enlisted men. The K-model airship, the type principally

used, displaced 12 tons and had a crew of 10 officers and men. Of the more than 89,000 vessels escorted by United States blimps during the war, not one was lost due to enemy submarines. After the war, the airship fleet of the United States Navy was reduced to 15 per cent of its peak strength. See also **WARSHIPS, MODERN—Aircraft Carriers.**

Naval Aviation in World War II.—At the time of the attack on Pearl Harbor on Dec. 7, 1941, the United States Navy had 5,000 planes, 6,000 pilots, and 43 air stations. By early 1945, the numbers had grown to 37,000 planes, 55,000 combat-trained pilots, including 10,000 marines, and 168 air establishments, with 325 satellite fields. Coast Guard aviation, along with the rest of that service, came under navy jurisdiction as usual during a war emergency. The peak number of United States aircraft carriers was approximately 100, including 27 of the fast, first-line type, and 69 small escorts. Three 45,000-ton carriers, the *Franklin D. Roosevelt*, *Midway*, and *Coral Sea*, were the most formidable ever laid down by any country.

Naval aviation operated in four major roles in United States participation in World War II. The first was in the Fast Carrier Task Force, a wartime concentration of air-seapower which operated around the clock through the use of night fighters. The second method of employment was the use of the fleets of escort carriers against submarines in the Atlantic and Pacific oceans. The third was to provide close air support for amphibious operations in general Allied advances, and the fourth was as a search and patrol arm, in which both shore- and tender-based planes were used.

An additional function was performed by the Naval Air Transport Service (NATS), which aided the fleet in the transportation of men and materials and evacuation of wounded in all theaters of operation. In 1946, NATS was still flying world routes totaling 45,000 miles.

In July 1946, planes from United States carriers conducted photographic and reconnaissance missions during the atom bomb tests at Bikini Atoll in the Pacific. On September 29, the *Truculent Turtle*, a long-range navy patrol plane, took off from Perth, Australia, on a record-breaking nonstop flight to Columbus, Ohio, 11,236 miles away.

In the postwar period, the majority of existing aircraft and carriers were placed on a reserve status, in what was known as the Mothball Fleet, ready for reactivation in a comparatively short time. In May 1947, this reserve fleet contained 79 carriers as against only 18 still in the active fleets.

Postwar research and development in naval aviation brought advances in the fields of jet propulsion, pilotless aircraft, rotary-wing aircraft (helicopters), air-sea rescue equipment and electronics, including vast improvement in radar-controlled landing procedures for blind flying.

Several types of jet-propelled or gas turbine-driven bombers and fighters were developed by the United States Navy for carrier operations, some capable of speeds of over 600 miles an hour. One of these, a nonmilitary research plane, the jet-propelled D-558, broke the world's speed record twice in one week, in August 1947, at Muroc Field, Calif., setting a high mark of 650.6 miles an hour. Both piloted and pilotless aircraft were produced to explore the transonic

and supersonic areas of speed. The field of winged guided missiles in the navy was assigned to aviation, and divided into four types, according to tactical mission. These were for firing from ship to airborne craft, ship to ship, plane to ship, and ship to shore.

The dual mission set up for naval aviation in the United States after the war was to incorporate into the country's air seapower all the latest developments in aviation, while at the same time pressing the need for continual improvement in existing methods and equipment. A. M. PRIDE,
Rear Admiral, United States Navy; Chief,
Bureau of Aeronautics.

NAVAL BASES. The sea power of a nation consists of: (1) its navy; (2) its merchant marine; and (3) its naval bases, the last mentioned meaning particularly its advanced overseas bases. No nation can obtain, nor long retain, command of the sea if it lacks any one of these three elements of sea power. The merchant marine of a country is not only one of the components of its sea power; it may be a principal reason why sea power is needed by a nation. All countries are dependent to some degree on seaborne commerce for their prosperity, but the importance, in time of war, of maintaining uninterrupted trade communications by sea with the outside world differs greatly as between nations. Maritime communications are of maximum importance to an insular country such as Great Britain, which must import a large part of the food it consumes, and also the raw materials used by its industries. Such communications are of minimum importance for a huge country such as Russia, which produces everything that it needs for its domestic economy within its own contiguous land areas. The United States falls somewhere between these two extremes.

The part which the navy plays in this triumvirate requires no detailed explanation. In brief, the function of the navy, in time of war, is to destroy the enemy's sea forces wherever they may appear, or to render them innocuous by close blockade. To put it in another way, it is the function of a navy, in time of war, to deny the use of the sea to the enemy, but to keep sea transportation to and from its own country uninterrupted. The navy is therefore the weapon of sea power. It is the function of naval bases to keep that all important weapon in good fighting condition.

Naval bases may play little part in a short war, or in a localized war. When that happens, it is only because sea power itself has not come into action. There have been wars of considerable proportions in modern times which were won

without the victor having command of the sea. The Franco-Prussian War (1870) is a case in point. During that war, France had undisputed control of the sea, so far as Germany was concerned, but nevertheless lost the war.

It may, however, be stated as an axiom that effective sea power cannot be wielded without naval bases. Why are naval bases so important? Because ships are dependent on the land for everything that goes into their construction, maintenance, and operation. Only the salt water that is pumped through the fire and flushing mains of ships comes from the sea. In the days of the sailing ship, there was an additional item—an important one—which did not have to be brought aboard from ashore: the energy of the wind driving the ship. Naval bases and the ships and aircraft in the service of supply of the fleet are the umbilical cord through which the fleet is nourished in time of war.

The requirements that naval bases have had to meet have undergone vast changes through the centuries. These changes have been mainly in the direction of adaptation to the ever increasing complexity of warships. In ancient times, when Phoenicia, Greece, and Rome in turn ruled the Mediterranean, the rowing galley was the weapon of sea power. The galley, overcrowded with fighting men and rowers, did not normally remain at sea even at night, but drew up along the shore in the late afternoon to give the men an opportunity to forage for food and to make camp for the night. With the development of sail power, the size of ships increased, and the living accommodations for the crews became more nearly adequate as compared to the overcrowded rowing galley. Ships remained at sea for longer periods of time, and eventually, the radius of action of the sailing ship became worldwide.

While the galley, or Viking ship, needed only a protected cove, or the estuary of a river, for a repair base, the sailing ship needed something more. For one thing, there had to be a hard sloping beach, with sufficient rise and fall of tide to permit careening ships to make repairs to their bottoms, particularly to their copper sheathing. The anchorage had to be protected from strong winds and the open sea. The depth of water had to be sufficient to accommodate the larger ships, but not so great as to make anchoring difficult. The shore establishment of the base had to carry a sufficient stock of such materials as timber, cordage, and canvas to replace spars, rigging, and sails. An important function of the base was to serve also as a revictualing station. Compared to modern requirements, the naval base of the sailing ship era was a simple affair, easily established, and easily maintained in times of peace. England became mistress of the seas during this era largely because of her far-flung naval bases, which often became the nucleus of new colonies, and always protected and stimulated her foreign trade. During the era of sails, warships came closer to achieving independence from overseas bases than at any time before or since, but it was independence only in a relative sense. Even sailing ships had their limits as to the length of time they could remain away from repair bases. During the War of 1812, the lack of a naval base for making repairs to spars, and for refitting rigging, brought David Porter's cruise in the *Essex* to a disastrous end, for the rotted rigging and the decayed spars of his ship gave way during preliminary maneuvers against

his British adversaries. By that time the *Essex* had been away from a naval base for 18 months. That was a long time for a ship to cruise without benefit of a navy yard, even in the days of sail.

During the first half of the 19th century, two changes occurred in ships which influenced profoundly the service demanded of naval bases. These developments were: the substitution of iron for wood as the principal shipbuilding material, and the substitution of steam for sails as the principal propulsive agency for driving ships. It took more than half a century to bring these innovations to the point where it can be said that iron had replaced wood, and that steam had replaced sails. The conservatism of seafaring men, and their reluctance to accept new ideas, are often given as the reason for the slowness of these developments. This is hardly fair to the great majority of those who followed the sea in one capacity or another during that period. The theoretical advantages of iron over wood, and of steam over sail, were so obvious that only the very prejudiced failed to grasp them; but 150 years ago there were some very real problems to be solved before the change could be completely made. These problems had much to do with naval bases, and the lack of worldwide ship repair facilities.

The iron ship and, later, the steel vessel operating in salt water was, until only a few years ago, subject to a very serious malady—the fouling of its bottom by marine growths. Within a few weeks after leaving dry dock, freshly painted, a noticeable falling off in speed took place. Within six months sometimes—depending on the waters being navigated—the increased power required to drive ships at their designed speeds reached serious proportions, due to fouling. To put it in another way, high-speed ships in particular, because of fouling, could not come within many knots of making their top speed after being out of dry dock a number of months. Iron ships therefore had to be docked frequently for cleaning and painting of their bottoms, even when no other underwater repairs were necessary. This was not a problem in the case of wooden ships, whose copper-sheathed bottoms were immune to fouling. Not until about the time of World War II was a bottom coating developed which permits steel ships to remain out of dry dock for as much as 18 months without serious fouling. The overwhelming defeat of the Russian Fleet by the Japanese, at the Battle of Tsushima (1904), was partly due to the fact that the bottoms of the Russian ships were so foul that the ships could not make the speed required to get them into the battle formation ordered by the Russian admiral when contact was made with the Japanese Fleet.

Fouling was soon recognized as one of the drawbacks to the adoption of iron for building the hulls of warships. Before Great Britain, as the foremost sea power of that period, could wholly adopt the iron ship, dry docks had therefore to be provided at home, as well as in distant parts of the world, for the periodic docking and painting of such ships. Naval bases equipped with fixed dry docks were consequently considered an indispensable element of sea power, up to the time of World War II. During that conflict, sectional floating dry docks of various sizes were provided, which, in effect, accompanied the fleet as it moved forward in the Pacific.

The adoption of steam power for ships carried with it an even greater logistic problem than the substitution of iron for wood in their construction. Steam meant that fuel had to be made available for ships in distant parts of the world, if sea power was not to be limited to the very short cruising radius of the early steam warships. Coal piles at distant naval bases therefore became closely associated with the conception of sea power. The fueling problem was no doubt in the mind of the author of the *English Seamanship Manual*, official textbook for the training of British naval officers, when he wrote, as late as 1860, that "there is no greater fallacy than to suppose that ships can be navigated on long voyages without masts and sails." This opinion was written more than 50 years after the first successful commercial steamship line began operating on the Hudson River, and some 40 years after the first ship crossed the Atlantic Ocean under auxiliary steam power. The German ships which found themselves in the Pacific Ocean at the outbreak of World War I had only a short shrift of activity, largely because they soon used up their fuel. Coaling at sea, either from prizes or from friendly colliers, proved very difficult, and sooner or later led the ships into the hands of the enemy. When oil replaced coal, many fuel problems were simplified for warships, including the difficulty of fueling at sea.

History is replete with examples of disastrous consequences to individual ships, to whole fleets, and to the best of war plans, because of the lack of naval bases. However, there has never been a wholly satisfactory solution of the problem of anticipating, in time of peace, the naval base requirements for war. It is nevertheless recognized as axiomatic that, unless the naval forces attempting to exercise command of the sea are continuously supplied with the innumerable things that ships consume, and with adequate docking and repair facilities, they must sooner or later fail in their mission; and that only naval bases in one form or another can supply these needs. The difficulty in solving this problem lies, for one thing, in the fact that, in time of peace, it is never possible to foresee with certainty what enemy, or alliance of enemies, must be faced in the next war. Then too, public opinion, particularly in democracies, is always opposed in times of peace to the expenditure of large sums of money in preparation for the next war. The result has been that advance naval bases have never been provided by any nation in such number, in such locations, and with such completeness as to fulfill all of the requirements of the next war. Such was the experience of both Great Britain and the United States when confronted with World War II. After World War I, Great Britain spent considerable money in establishing a large naval base at Singapore, and smaller bases elsewhere in the Orient. The United States developed the navy yards at Cavite and Olongapo in the Philippines, so far as permitted by the limitation of armaments treaties adopted after World War I. After Japan denounced these treaties in 1936, the navy attempted to obtain appropriations to develop Guam in addition, but it was then too late. The United States had also, over a period of 30 years, built up a first class naval base at Pearl Harbor, but this was more in the nature of a bastion for the West Coast, than an advance base in support of a fleet operating in the western Pacific. The Netherlands

had also a sizeable investment in naval shore establishments in Java, on which most of the Dutch Navy was based.

The combined bases of these three nations in the Orient were not, however, sufficient to support a fleet large enough to come to grips with the Japanese Navy immediately on the outbreak of World War II; and, as a result, Japan captured all of the advance bases of the United Nations in the Orient within a few months after the attack on Pearl Harbor. This experience illustrates perfectly the dependence of the fleet on overseas naval bases. It demonstrates that without constant support from ashore, the fleet cannot exist; and that, without the continuous protection of the fleet, naval bases must sooner or later fall into the hands of the enemy.

The plans for a war with Japan recognized as a practical certainty that the naval bases in the western Pacific could not be held until the fleet, and the required logistics, had been built up to the point where the offensive could be taken in that area. The plans therefore included the development of advance base facilities along two lines. The one line was the expansion of the train and of the service of supply of the fleet. Before World War II, the train, which is in effect a mobile naval base, consisted of a few repair ships, tenders for destroyers, and submarines, ammunition ships, oilers, hospital ships, seaplane tenders, cargo ships, a salvage vessel, and a few other units not primarily combatant craft. A small floating dry dock, large enough to dock destroyers, had been added just before the outbreak of the war. Qualitatively, the units were excellent, but in numbers they amounted to no more than prototypes. A large construction program to augment the train was undertaken just before the war. More than 1,500 auxiliary ships, of the types mentioned, were ultimately built or converted, from merchant ships for this service, not including commercial tankers and cargo ships, which required no special features for naval use. The early naval task forces in the Pacific theater of the war were dependent entirely on the train for their supplies. In case of serious battle damage, ships had to make the best of their way back to Pearl Harbor, or to navy yards in the United States.

The second line of development contemplated the establishment of bases on captured islands, or on near-by islands, as soon as the war had shifted to the offensive. In accordance with this plan, the first advance base in the Pacific was established at Espiritu Santo, in the New Hebrides, after the southward progress of the Japanese had been checked at the Battle of the Coral Sea, during the first week of May 1942. From that time on, until the capture of Okinawa in June 1945, the war in the Pacific was, in effect, a continuous battle for advance bases, where airfields, supply depots, and ship repair facilities could be established, to serve as the springboard for the next offensive movement deeper into enemy territory. As the forces advanced, new bases were established, partly by stripping the old bases and moving their stores and repair facilities forward. This process came to be known as "rolling up the back areas."

The advance bases ranged in size from small units for the maintenance and repair of patrol boats, manned by only a few officers and men, to major repair bases comprising floating dry docks, pattern shops, foundries, machine shops—in fact,

practically all of the facilities to be found at a navy yard, or an air station, in the United States. They were manned by all of the trades and specialists employed at such stations. Some bases served particular purposes, such as providing hospitalization, rest, and recuperation for naval personnel relaxing after their return from combat zones. Convoy escort bases were located at the terminals of convoy routes, to provide fuel, stores, ammunition, and repair facilities for merchant ships and their escort vessels. A total of 152 floating dry docks, ranging in size from small units to huge sectional docks capable of lifting the largest battleships, were built for the bases after the war started. These floating dry docks contributed immensely to the speed with which ships damaged in combat could be repaired and returned to service. Many damaged ships would probably not have reached Pearl Harbor, because of the distance involved. Some of the bases were set up and operated only as airfields for the use of protective fighter planes and bombers. Others were developed into staging bases for anchoring, fueling, and reequipping the huge armadas of transports, cargo ships, oilers, and other vessels comprising the train which accompanied the combat forces and serviced them at sea.

The most important bases developed in the Pacific were the main repair bases at Espiritu Santo, in the New Hebrides; Manus, in the Admiralty Islands; Leyte-Samar, in the Philippines; and Guam in the Marianas. The last mentioned was established as soon as Guam was recaptured in the summer of 1944. This base alone was capable of supporting one third of the Pacific Fleet, and was the springboard for operations against Iwo Jima and Okinawa. These bases were capable of repairing major battle damage to the hulls and equipment of ships, and made it possible for the fleet to survive the Japanese suicide air attacks during the last months of the war. The naval and air forces needed to accomplish specific missions could be much reduced once these extensive base facilities were available close at hand, instead of being 5,000 miles away.

More than 400 bases, ranging in importance from small weather stations to full-scale fleet repair bases, were established in the Atlantic and the Pacific theaters during World War II. Many of those in the Pacific were in operation only a short time, being moved forward as the back areas were rolled up. In the western Atlantic, this element of sea power turned out to be less important than in the Pacific, because the United States Navy, in the former theater, was called on principally to fight a war against the German submarine. Some of the western Atlantic naval bases were, however, extremely valuable in carrying on this subsurface war. In the eastern Atlantic and Mediterranean, British bases were largely used.

Acquisition of Atlantic advanced bases by the United States began in the summer of 1940, when the Battle of Britain was in its initial stages and German submarines were making heavy inroads on shipping around the British Isles. At the beginning of the war, the British Navy had suffered severe losses, particularly in destroyers, during the Norwegian campaign and in the evacuation of Dunkerque. To make good these losses, Great Britain entered into an agreement with the United States to exchange certain rights in various localities in the Atlantic area adapted to the

establishment of advance naval bases, for 50 of the older destroyers which were no longer fit for fleet service, but suited for antisubmarine duty. The bases so obtained are located in Newfoundland, Bermuda, Antigua, Jamaica, St. Lucia, the Bahamas, Trinidad, and British Guiana. These bases advanced the sea frontier of the United States several hundred miles in the direction of the Axis powers, and as they were leased for a term of 99 years, they continued to be of strategic importance to the United States after the war.

In order to give the construction of advanced naval bases the special attention warranted by their importance, there was added to the United States Navy, at the outbreak of World War II, a ground organization called the Naval Construction Battalions—popularly known as the Seabees. These battalions were recruited largely from the ranks of the construction industry, and consisted of workers from about 60 trades, the most important of which were operators of construction machinery and power plants, concrete workers, metalworking mechanics, carpenters, and electricians. The officers were assigned from the navy's Civil Engineer Corps, which is made up of graduate civil engineers and men who have specialized in the management of construction work. The basic administrative and operational unit of the Seabees was the battalion, which was composed of four construction companies and one headquarters company. Each battalion had a complement of 34 officers and 1,082 men. The diversification of trades, the training, and the equipment were such as to make each battalion a self-sufficient unit as a construction team, and as a fighting force when the need arose. By June 1945, the personnel of the construction battalions had grown to about 259,000, of whom 214,000 were stationed overseas, most of them in the Pacific.

The Seabees accompanied the first waves of the assault forces in an amphibious operation. Their first job was to get equipment ashore to build an airstrip for the use of protective fighter planes, and to assemble pontoons into causeways, landing docks, and other such facilities. They assisted also in clearing away any underwater obstacles placed by the enemy. Then roads were built for moving supplies from the exposed beaches to more protected positions inshore, or to the location chosen for the base. Sources of potable water were next developed, mess and hospital facilities set up, gun emplacements built, and radar and radio equipment installed. The construction of shops and store houses, the assembling of floating dry docks, and the installation of facilities of all kinds then followed, if a repair base was in the making. Finally a contingent of Seabees was left to take care of the maintenance of the base. The setting up of bases, and getting them into operation, was accomplished with amazing speed. By the use of a very carefully planned functional component catalogue, it was possible to order in advance all of the parts and equipment needed to set up any type of base, from a small weather observation post to a fully equipped air station or ship repair yard.

The responsibilities of the Seabees ended with providing the shore facilities and floating dry docks, and with keeping them in operating condition once they were provided. The actual repair and maintenance work on ships and aircraft was not done by the Seabees, but by the engineering duty officers, the mechanics, and the artificers

forming part of the officer and enlisted personnel of the navy. The repair forces at the advance bases and on the ships were the unsung heroes of the war. The part they played was less glamorous than that of the Seabees, but it was the end toward which all of the efforts in establishing advance bases were directed. The repair forces for manning advance bases, and, to a considerable extent, for manning repair ships, were organized as Ship Repair Units. The men for these units were specially selected and trained, with particular emphasis on their versatility, ingenuity, enthusiasm, and physical stamina, rather than on their outstanding proficiency as craftsmen in the various trades which they represented. There was no problem of trade jurisdiction, or limitation on daily output, which so often, even in time of war, interferes with the rapid performance of work in civilian establishments, because all of the personnel were commissioned or enlisted in the naval service. The mission of the units was to keep the ships at the front in fighting condition, and, if that were not possible, then to repair battle or other damage sufficiently to permit the ships to return safely to home yards for complete repairs. High standards of workmanship in accomplishing this mission were of secondary importance—speed and ingenuity counted above everything else. All jobs were emergency jobs, with long working hours the rule rather than the exception. There was, of course, no overtime pay for such work. The training and general administration of the Ship Repair Units came under the cognizance of the Bureau of Ships. The transportation, storing, and issuing of hundreds of thousands of items, including machinery spare parts, food, clothing, and other materials were handled by the Supply Corps of the navy, and by other personnel assigned to this duty. In order to keep supplies moving, and to reduce to a minimum the time during which ships were exposed to air and torpedo attack while unloading at advance bases, the longshoring was handled by special stevedoring battalions.

By July 1945, one fifth of the entire personnel of the navy, about 500,000 officers and men, were stationed at advance naval bases, or were engaged on work connected directly with the construction or operation of such bases. During the month of July 1945, approximately 800,000 long tons of materials of all kinds were handled by the advance bases and the fleet train in the Pacific. At Guam alone, 1,000,000 gallons of aviation gas were used daily during the month of June 1945. During the Okinawa campaign, naval ships fired 50,000 tons of projectiles, ranging in size from 5-inch to 16-inch. Ammunition of this kind was usually supplied directly to the combat ships by ammunition ships.

Late in the 18th century, in the heyday of the sailing man-of-war, a few hundred items stocked at an advance base sufficed to keep the ships going. There are now over 900,000 items used by the navy. Radar alone, in a few years, added about 30,000 items to the list, any one of which may be suddenly needed as a replacement by a ship in a task force engaged on a vital mission. The most reliable way to keep the machinery of ships running is by the lavish use of spare parts. This is particularly true of the internal combustion engines with which the smaller ships and aircraft are powered, and of the great variety of auxiliary machinery, much of it electric,

installed on all ships. Replacement instead of repairs to machinery was found to be the best way to keep ships at the front, but it added greatly to the list of items that the train and the advance bases had to furnish on short notice. Improved wireless communication, and the development of a naval air transport service, did much to mitigate some of the additional supply problems that the increased complexity of warships brought to the fore. The Naval Air Transport Service did not get into its stride until the middle of 1943, largely because of lack of trained personnel and of suitable aircraft. By July 1945, the service operated 80,000 miles of basic routes connecting the principal distribution centers in the United States with the advance bases in all of the theaters of the war. For the two-year period from June 1943 to July 1945, Naval Air Transport made a total of 20,396 flights, handling 125,197 tons of material.

A few examples of the problems that air transport solved for advance bases may be of interest. A cruiser in the South Atlantic stripped a reduction gear pinion. A replacement pinion weighing 6,000 pounds was flown from Philadelphia to Recife, Brazil, in 34½ hours and was there installed in the cruiser, restoring the ship to service in a few days. The battleship *New York* suffered a casualty in the western Pacific which normally would have necessitated the return of the ship to Pearl Harbor. Spares weighing 10,000 pounds and 6,500 pounds respectively were flown in 72 hours from the Norfolk Navy Yard to the advance base at Manus, where they were installed in the ship. A French cruiser engaged in bombarding the Italian coast ran out of projectiles. Within 36 hours, 30,000 pounds of projectiles were flown from New York to Bizerte. In the last stages of the preparation for the invasion of Normandy, the United States Navy base at Dunkeswell, England, needed additional minesweeping gear. Between May 15 and May 23, 1944, 225,000 pounds of such gear were flown from New York to Dunkeswell. Air transportation of such material is enormously expensive if measured in dollars and cents alone, but when measured in terms of ships kept in the front lines, it is very cheap.

In one respect only, namely in supplying fuel, were the logistic requirements of the fighting ships of World War II simpler to meet than they were for the ships of World War I. After the latter conflict, oil gradually took the place of coal as fuel for practically all warships, partly because oil is far easier to transport, handle, and transfer to ships than coal. This development led to the building of high-speed tankers equipped with special gear for delivering fuel to ships under way at sea, at normal cruising speeds. The technique of transferring oil at sea to a ship under way progressed so rapidly, under the necessity of war, that it soon became routine practice even in rough weather. The same technique was used for transferring stores and ammunition to ships under way. While some oil storage was provided for emergency use at a few advance bases in the Pacific, most of the storage was eventually concentrated in the floating-tank farm at Ulithi, an atoll south of Guam. This base consisted of standard commercial tankers, from which the fuel was pumped to the high-speed oilers already mentioned. The magnitude of the fuel problem in the war with Japan is best illustrated by the statement that 25,026,000 barrels of

bulk fuel were shipped to the Pacific for war purposes during the single month of June 1945.

The experience of World War II demonstrated, as never before, that naval bases are an essential element of sea power, and that the United States could not project its power, west of Hawaii in the Pacific, without extensive additional base and fleet train facilities. These bases and facilities had to be provided, and had to accompany the fleet before sea, air, and land power could be used effectively against Japan.

In order to expand base facilities quickly when needed, the mobile units comprising the fleet train, including floating dry docks, repair ships, tenders, and store ships, must be kept in various degrees of readiness as part of the active fleet, of the ready reserve fleet, and of the laid-up reserve fleet. Such mobile units must be available to be sent forward in time of war, to assigned stations, when the area has been cleared of the enemy sufficiently to permit establishing a base. In occupying an advance base site, it may again be necessary, in the early stages, to depend entirely on floating facilities. As occupation expands, the shore facilities would be developed, ultimately providing a balanced repair, supply, and air base.

In peace time some components of the fleet train, like other units of the fleet, must be kept in full commission for training personnel, for participation in maneuvers, and for working out the procedures best adapted to the function of advance bases. Improvements in the prototypes of mobile base units, made to keep them in step with technological advances in ships and in industry, must receive constant attention.

Finally, it may be said that modern transportation and communication facilities have, in effect, made a naval base of the mainland of the United States; but this statement remains true only so long as the United States retains control of the sea and of the air. Overseas bases, in fact, are no more than strategically located branches of the main base, which is the United States. Sea, ground, and air potential are therefore irrevocably linked with the industrial potential of the country itself. See also NAVAL DISTRICTS.

J. A. FURER,

Rear Admiral, United States Navy (Retired).

NAVAL COMMUNICATIONS AND RADIO STATIONS. The Naval Communication Service of the United States Navy is an activity of the Navy Department, established under the chief of naval operations, and is administered by an officer of the navy, usually a rear admiral, detailed to duty as the chief of naval communications. In accordance with broad policies laid down by the secretary of the navy and the chief of naval operations, the chief of naval communications carries out the following tasks: plans and supervises all elements of the Naval Communication Service both ashore and afloat; prepares communication operational and logistic plans; develops and prepares all navy and certain joint army and navy cryptographic aids, communication instructions and call sign books; operates the registered publication system which distributes all navy registered and nonregistered communication publications; procures, assigns, and protects radio frequencies for naval electronic equipment; supervises naval

postal affairs; administers the accounting and disbursing of radio, wire, and cable tolls; operates the Navy Department message center; determines the military characteristics, requirements, and allowances of naval communication equipment for ships and shore stations; maintains liaison with other activities of the navy on matters of research, development, and procurement of communication equipment; maintains active contact with other branches of the military services, with civil agencies of the United States, and with representatives of foreign nations in matters involving military communication methods, procedures, and operational techniques; plans for and participates in international telecommunications conferences where navy interests are involved. The foregoing is also contained in the *Code of Federal Regulations*, part 26, section 26.14(g).

Naval Communication Policy.—The United States naval policy, as approved by the secretary of the navy on Jan. 27, 1947, declares the naval communication policy to be:

(1) To provide and maintain a naval communication system, and the security thereof, based on war requirements.

(2) To operate the naval communication system as required by fleet operations, and by the naval shore establishment, including overseas possessions and bases.

(3) To use the naval communication facilities to promote the safety of life at sea and in the air, maintaining adequate communication with stations of the United States merchant marine and aircraft flying over the sea.

(4) To encourage such development of the commercial communication activities of the United States as will enhance their military value in time of national emergency and safeguard the communication interests of the United States.

(5) To cooperate with the army to reduce duplication of effort and to standardize methods of communications in war.

Development of the Service.—While the Naval Communication Service, per se, is a very modern organization of 20th century origin, the first use of specialized communication procedures among American ships of war was in 1778, when the Continental Marine Committee distributed to the American Fleet the first general instructions for making a few simple maneuvers and recognition signals in a manner similar to that used in other navies for centuries. In 1796-1797, Capt. Thomas Truxtun, United States Navy, prepared and published a book which was the first American signal book to use the numerary system (*Instructions, Signals, and Explanations Offered for the U.S. Fleet*). What is generally regarded as the first official naval signal book was prepared by Capt. John Barry and Capt. James Barron. This publication was brought into use in 1800, and is considered the forerunner of the navy's *General Signal Book*. In the 18th and 19th centuries, primary means of communications were letters, signal flags, and speaking trumpets. A stout pair of lungs in a burly boatswain's mate is still regarded as a most useful means of communications and as one of the most reliable for short distances. No important changes were adopted in naval communications until about the time of the Civil War (1861-1865). The navy used the newly established commercial wire telegraph system to communicate with its units at various ports but did

not attempt to establish a system of its own. The navy also adopted certain elements of the army system of signals, and instruction in the Myer's code was included in the curricula at the United States Naval Academy. The Navy Signal Office was first established in 1869, under the Bureau of Navigation. In 1875, the navy began experimenting with electric lights for signaling, and the following year they were read at a distance of six miles by means of the "machine" and electromagnetic device, constructed by Professor Moses G. Farmer. Use of the flash lamp method, perfected by Lieut. W. N. Wood, which permitted signals to be read at a distance of 16.9 miles, followed in 1878. The Bureau of Navigation was soon unable to deal adequately with the technical aspects of the rapid advances made in communications and in 1890, the Navy Signal Office was abolished, and the Bureau of Equipment was assigned the responsibility for experiment and development. On March 15, 1898, the secretary of the navy issued orders to the president, Naval War College, to institute planning for the establishment of a coastal signaling system on the Atlantic and Gulf coasts. The present Coast Guard lighthouse, weather, and lifesaving systems, grew from this planning.

Officials of the Navy Department were keenly interested in the Marconi experiments in 1898 and 1899 and they invited Guglielmo Marconi to try out his wireless telegraph under United States Navy auspices. The U.S.S. *New York* and the U.S.S. *Massachusetts* were first equipped with Marconi's wireless apparatus and on Nov. 2, 1899, they exchanged messages across 36 miles of ocean. Naval officers were quick to appreciate the tremendous possibilities in the wireless telegraph. Additional ship installations were made and shore stations were set up at Washington, D.C., and at Annapolis, Md. In 1902, after a series of successful tests in the Chesapeake Bay area, all major vessels of the fleet were ordered equipped with the Slaby-Arco equipment, of German design, which then was considered to be the best available. Additional shore stations were ordered to be established.

Wireless was given its first practical test during battle maneuvers of the United States Fleet in 1903. The Blue forces were adjudged victorious over the Red forces and success was attributed to a single radio message which had rallied the Blues at night. The value of the wireless in naval operations was thus forcefully demonstrated and the more progressive minded naval officers agreed that wireless equipment must be installed on all fighting ships of the United States Navy. Six experimental stations were built and a special training school was established at the New York Navy Yard to spread the knowledge regarding the wireless telegraph throughout the navy. The United States radio industry was commencing to grow rapidly at this stage, and the need for control and regulation of radio communication was recognized by President Theodore Roosevelt. A special board appointed by the president to study supervision of the air waves recommended a three-way assignment: army control of interior military stations; navy control of coastal military stations; Department of Commerce control of commercial stations. Congress passed legislation providing for the regulation of radiotelegraphy in 1912. One noteworthy feature of this measure was the navy's obligation to open its facilities to commer-

cial traffic. As usage of radiotelegraphy increased, so did the need for modernization of coastal stations. The greatly increased number of ship and shore stations, and the increased cost and complexity of equipment required an expansion in the administration of naval communications. The Office of Superintendent of Radio was established under the Bureau of Navigation in 1912. The technical aspects of radio remained under the Bureau of Steam Engineering (later named Bureau of Ships). In accordance with Navy Department General Order No. 240, the Naval Radio Service commenced actual operations when the act became effective on Dec. 13, 1912. This date may well be considered to be the birthday of the Naval Communications Service as it existed in 1947.

Congressional legislation in 1915, created the Office of the Chief of Naval Operations. Among many other things the new chief of naval operations was charged with the operation of the radio service and other means of communications. The Naval Radio Service was reorganized and the Office of Communications was established in the Navy Department. Shortly thereafter, Navy Department General Order No. 226 of July 28, 1916, established the Naval Communication Service under a director of naval communications. The first director, Capt. William H. G. Bullard, USN, was made directly responsible to the chief of naval operations. The title of director was changed to that of chief of naval communications in 1945, but the authority and duties of the chief remain about the same and have already been described fully in this article. See also SIGNALS, NAVAL; TELEGRAPHY AND TELEPHONY, RADIO.

Operation of the Service.—The naval communication system is, of necessity, a flexible organization increasing or decreasing from time to time, according to military requirements. Basically, the Naval Communication Service is composed of a number of shore communication stations and a communication station aboard each ship and aircraft. The major shore communication stations are normally composed of a radio transmitting station, radio receiving station, a message and control center integral with the naval headquarters being served, a wire or relay center, a cryptographic room, a registered publication issuing office, and such supplementary or security activities as may be advisable. Each shore communication station is designed to serve the command with which it is associated and to give adequate fleet communication support. Continental communication stations are connected by leased wire networks which form the navy NTX system and link all important navy commands within the continental United States by teletype. Emergency radio communications are available to replace these leased land lines in case of an emergency. Leased and toll telephone service is also provided within the continental navy shore establishment. Overseas communication stations are connected by radio circuits, normally radio teletype, which can tie in directly with the continental NTX system as required. The communication stations aboard ships and aircraft are equipped with various types of radio equipments, depending on the size and mission of each mobile unit, which will effectively tie each one into the naval communication system. The primary means of communication to ship units is by means of a highpower CW broadcast (Morse

code) from a regional station for reception by all ships in the area at the time. Reliable reception is an essential feature of such a "no answer" method; hence the navy broadcast stations must transmit on several frequencies simultaneously with appropriate power to cover the area served.

Several basic features of military communications as distinct from commercial communications are noted. Commercial communications must handle normal peacetime traffic loads at a profit. Military communications must: (1) cover strategic areas in accordance with national policy, the importance of the areas being not necessarily based solely on the population or industrial plants in the area; (2) be able to keep in constant touch with and adequately control forces in the designated strategic areas; (3) be as independent of commercial communications as practicable, in order to have control of communications necessary to meet emergencies. Military communications, like military forces, are primarily insurance measures for national security rather than money-making ventures.

The Naval Communication Service is, in effect, the nerve system of the navy. It functions in close liaison with the United States Army and Air Force communication systems and with all commercial communication systems. Equipments, methods, and procedures are constantly being improved and standardized to effect coordination and economy insofar as consistent with operational requirements. Integration and cross connection with other communication systems is essential to provide for flexibility and expansion in emergencies. Incidentally, message service is rendered to other government agencies without cost whenever this can be done without increasing navy communication personnel or facilities.

World War II Developments.—The Naval Communication Service expanded tremendously in World War II as necessary to support the operation of navy mobile forces. The total personnel engaged in navy communications in 1945 was roughly 20 times the number so engaged in 1939. However, while the personnel expansion factor was 20, the cost of equipment and the extent and capacity of the service provided by the system was expanded to over 300 times the 1939 level. This is indicative of the technical developments made, and of the greatly increased need for and importance of rapid communications during World War II. Rapid and reliable military communications permitted a speeding up of the coordinated war effort and enabled the armed services to maintain a split-second time table in mounting and conducting large scale operations. Besides expanding the navy communication personnel and equipment as was necessary for handling a tremendous volume of navy messages daily to all parts of the world, other achievements of naval communications during World War II include: (1) research and development which resulted in many improved methods of communications and security; (2) participation in development and use of multi-channel radio teletype circuits; (3) development and use of radio, radar, and sonar, and countermeasures therefore; development and use of loran and other radio aids to navigation (q.v.) in the air and on the sea; (4) expeditious handling of literally billions of pieces of personal and official mail to and from widely dispersed ship, air, and shore units; (5) communication service

to all United States merchant ships engaged in war services; and (6) handling of radio press and radiophoto service on an unprecedented scale in order to keep the American public informed as to the progress of the war.

Naval communications thus enabled vast and diverse navy forces to operate as a team; provided means for coordination of carrier task force and joint amphibious force operations; provided essential means for accurately controlling direct attacks and landings; made possible the split-second timing essential to successful air attacks and naval bombardments supporting troop landings; and conveyed swiftly and accurately the information essential to planning and executing naval operations. Consult Schubert, Paul, *The Electric Word* (New York 1928); Archer, Gleason L., *History of Radio to 1926* (New York 1938).

C. F. HORNE,
Captain, United States Navy; Deputy Chief
of Naval Communications.

NAVAL CONSTRUCTORS. Naval constructors were, until 1940, a separate corps of officers of the United States Navy, having charge of the designing, building, and repairing of the ships of the navy. By act of Congress, they were amalgamated with the Line of the Navy in 1940. See also NAVAL ARCHITECTURE.

NAVAL DISTRICTS. The geographical limits of the United States naval districts and their headquarters are as follows:

District No.	Geographical limits	Headquarters
1	Maine, New Hampshire, Vermont, Massachusetts, and Rhode Island (including Block Island).	Boston, Mass.
2	There is no second naval district.	
3	Connecticut, New York, northern part of New Jersey including counties of Mercer, Monmouth, and all counties north thereof, also the Nan tucket Shoals Lightship.	New York, N. Y.
4	Pennsylvania, southern part of New Jersey including counties of Burlington, Ocean, and all counties south thereof; Delaware, including Winter Quarter Shoal Light Vessel.	Philadelphia, Pa.
5	Maryland less Anne Arundel, Prince Georges, Montgomery, St. Marys and Charles counties; West Virginia; Virginia less Arlington, Fairfax, Stafford, King George, Prince William and Westmoreland counties; and the counties of Currituck, Camden, Pasquotank, Gates, Perquimans, Chowan, Tyrrell, Washington, Hyde, Beaufort, Pamlico, Craven, Jones, Carteret, Onslow, and Dare in North Carolina; also the Diamond Shoal Lightship. The omitted counties constitute the "Potomac River Command."	Naval Operating Base, Norfolk, Va.
6	South Carolina, Georgia, and North Carolina except the counties of Currituck, Camden, Pasquotank, Gates, Perquimans, Chowan, Tyrrell, Washington, Hyde, Beaufort, Pamlico, Craven, Jones, Carteret, Onslow, and Dare; and the counties of Nassau and Duval in Florida.	Charleston, S. C.
7	Florida, except the counties of Nassau and Duval and those west of the Apalachicola River.	Miami, Fla.
8	Florida counties west of Apalachicola River, Alabama, Tennessee, Louisiana, Mississippi, Arkansas, Oklahoma, Texas.	New Orleans La.
9	Ohio, Michigan, Kentucky, Indiana, Illinois, Wisconsin, Minnesota, Iowa, Missouri, North Dakota, South Dakota, Nebraska, Kansas.	Great Lakes, Ill.

District No.	Geographical limits	Headquarters
10	The Island of Puerto Rico, other U.S. islands in the Caribbean Sea, the Caribbean Sea itself, and to limits as defined by the Navy Department.	San Juan, Puerto Rico
11	New Mexico, Arizona, Clark County, Nevada, southern part of California, including counties of Santa Barbara, Kern, and San Bernardino, and all counties south thereof.	San Diego, Calif.
12	Colorado, Utah, Nevada (except Clark County), northern part of California, including counties of San Luis Obispo, Kings, Tulare, Inyo, and all counties north thereof.	San Francisco, Calif.
13	Washington, Oregon, Idaho, Montana, and Wyoming.	Seattle, Wash.
14	Hawaiian Islands and islands to westward, including Midway, Wake, Kure, Johnston and Sands Islands, and Kingman Reef. Guam and American Samoa are not under any Naval District.	Pearl Harbor, T. H.
15	Panama Canal Zone.	Balboa, C. Z.
16	Philippine Islands.	Cavite, P. I.
17	Alaska and Aleutian Islands.	Kodiak, Alaska

Each naval district is commanded by a designated commandant who is the direct representative of the Navy Department and its bureaus. In the administration of the affairs of the district, the commandant does not personally supervise the management of the several groups or units under him, but transacts the necessary business with the officer commanding the group or unit. The responsibility for the organization and efficient operation of administrative units within his command, such as, United States naval bases, recruiting stations, submarine bases, schools, inspection activities, navy shipbuilding activities at private plants, etc., rests with the officer in command of each unit. Communications relating entirely to the technical work of these establishments are carried on direct with the bureau or station concerned. Communications of any administrative unit, which involve questions of military policy or which affect the operation of any other unit in the district, are forwarded through the commandant of the naval district for recommendation or other appropriate action.

The most important groups under certain of the naval districts are the "United States naval bases," formerly known as navy yards, located at Portsmouth, N. H.; Boston, Mass.; Brooklyn, N. Y.; Philadelphia, Pa.; Norfolk, Va.; Charleston, S. C.; Bremerton, Wash.; Mare Island, Calif.; and Pearl Harbor, T. H. The mission of a naval base is to furnish direct service to the operating forces. A naval base is defined as that agency in a given locality which comprises and integrates all naval activities which are capable of contributing to its mission. A component of the naval base is the "United States naval shipyard" under which are integrated all departments and divisions of the former navy yard organizations which contribute directly or indirectly to the building, repairing, overhauling, docking, altering, converting, and outfitting ships; and to related or special manufacturing. In addition to the shipyard, the naval base may, and, in the case of practically all naval districts, does, contain other activities, such as a naval supply depot, a naval hospital, a naval ammunition depot, a naval net depot, a naval receiving station, a marine barracks, etc. All of the component activities of the naval base, including the shipyard as a component activity, are under the

military command and coordination control of an officer designated commandant of the naval base, who is directly responsible to the commandant of the naval district in which the base is located. The command relationship of the commandant of the naval base to the several component activities parallels that of a division flag officer to the ships of the division under his command, in that the commanding officer of each component activity exercises autonomy within his command and must produce results which contribute to the effectiveness of the naval base as a whole.

Each of the component activities of a naval base, including each shipyard as one component activity, is under the direct control of a commanding officer. Each such commanding officer is under the supervision of the commandant of the naval base for matters of internal security, defense, administration of military personnel, and for coordination of his activity with other components of the naval base in providing logistic services to the operating forces. For all other matters, including assignment of work, allotment of funds, assignment of personnel, establishment of operating methods, procedures, organization, etc., each such commanding officer is under the direct supervision of the cognizant agency of the Navy Department, except when such control is specifically delegated to the district commandant by the Navy Department.

The officer ordered to command of a United States naval shipyard must be technically trained in the building and repair of ships and must have had substantial previous experience in the technical and management phases of such work, both in United States naval shipyards and in the Navy Department. Such commanding officer may have been designated for engineering duty only. It is the duty of the commanding officer of a naval shipyard to supervise and direct all of the work of the shipyard; to assume full responsibility for the quality and quantity of work produced; and to assure the efficient and economical performance of the work of the shipyard.

J. A. FURER,

Rear Admiral, United States Navy (Retired).

NAVAL EDUCATION. Modern naval warfare makes use of practically every science and engineering art known to man. The profession of the naval officer and even of the enlisted man has therefore become one which no longer can be learned merely by practice and by going to sea, but must have its roots in scientific knowledge. Hence the educational policy of the most progressive navies has become one of providing Line officers with a broad general education in mathematics, the sciences, languages, and certain professional subjects, and of giving selected officers additional education and training in the many specialties that are needed to design, build, and operate modern warships. The educational system of the principal navies will be briefly described.

United States.—Under normal conditions all officers of the Line of the United States Navy, and many of its staff officers, including second lieutenants of the marine corps, are taken from graduates of the United States Naval Academy. Midshipmen are appointed to the Naval Academy in various ways, most of them being appointed by congressmen and senators. The president also has a certain number of appointments that he can make each year, his

appointments generally going to the sons of naval officers, because such boys are not usually able to obtain congressional appointments. In addition, a limited number of appointments are made each year from the enlisted personnel of the regular navy and from the Naval Reserve force. Candidates must pass a rigid physical examination and must have had at least a high school education, or the equivalent, in order to meet the mental requirements for entrance. Many candidates have actually had several years in college. The entrance age is from 17 to 21 years. The course at the Naval Academy consists of four years of very intensive study, the stress being laid on mathematics, languages, engineering subjects, and on professional subjects such as navigation and ordnance. With the ever-increasing importance of the scientific approach to all branches of naval work, more and more of the curriculum is being devoted to the broad principles of engineering, leaving less and less time for special studies. This has resulted in the need for more postgraduate study by naval officers. Unfortunately, very little time is available at the Naval Academy for cultural studies.

A realization of the need for educating at least a small number of specialists beyond the curriculum supplied by the Naval Academy began with the transition of the navy from sail to steam, and from smoothbore to rifled guns. This transition came into full swing in the decade following the Civil War. Naval architecture and shipbuilding, especially in the United States, had until that time been almost entirely an art, having only a slight scientific and engineering foundation. Naval constructors (q.v.) were chosen from among the shipwrights employed in the navy yards, or from the so-called draftsmen of that period. While some very fine craftsmen were to be found among these men, none had had a scientific education. In Europe, however, especially in France, considerable progress had been made by the third quarter of the 19th century in applying scientific principles to the study of naval architecture (q.v.) and to practical shipbuilding.

In 1879 two cadet engineer graduates of the United States Naval Academy were granted permission to study naval architecture at the Royal Naval College at Greenwich, England, preparatory to their transfer to the construction corps of the navy. This established the practice of sending graduates of the Naval Academy abroad for courses of instruction in naval architecture prior to their transfer to the construction corps. In 1880 two Naval Academy graduates were sent to the *École d'application maritime*, Paris, for similar postgraduate work. Later a number of officers were sent to the University of Glasgow for such study. Naval constructors continued to receive their postgraduate instruction at Greenwich, Paris, or Glasgow until about 1901 when the British Admiralty closed Greenwich to American students. The postgraduate education of naval constructors was then transferred to the Massachusetts Institute of Technology, Boston, where it has been conducted since that time. The course consists of three years of study leading to the degree of Master of Science. The construction corps was amalgamated with the line in 1940, the former officers of that corps being designated for engineering duty only. The postgraduate education of the

officers responsible for ship design, whether for the machinery or the hull, now follows the same general lines and covers three years at the Massachusetts Institute of Technology, with an opportunity for some specialization during the last year.

With the advent of steam, a corps of officers known as the engineer corps was established in the navy for designing and operating the propelling machinery of naval ships. Until 1899 a certain number of each class of naval cadets were given a special course in engineering studies during their last year at the Naval Academy preparatory to their assignment to the engineer corps on graduation. A few engineer officers also pursued postgraduate studies abroad, but such courses never became a recognized part of the education of the engineers as they did in the case of the naval constructors.

By the end of the 19th century the mechanical and engineering features of naval ships had become so important that it was felt that line officers as well as engineer officers needed considerable knowledge of engineering in order to perform intelligently and efficiently all the duties of naval officers. This feeling led to the amalgamation, by an act of Congress in 1899, of the engineer corps with the Line of the Navy, with the idea that thenceforth all officers would be required to perform some engineering duties. In this way the Personnel Act of 1899 had a profound influence on the postgraduate system of education in the navy as it exists today, because it was soon realized that the Naval Academy could not, in four years, do more than teach the officers the fundamentals of engineering—enough for operating, but not enough for designing naval machinery.

Postgraduate instruction for young naval officers in branches other than naval construction was advocated as early as 1904, and resulted in four officers being detailed each year for special study in ordnance and four for special study in marine engineering. At this time the use of electricity on board ship, as well as the development of wireless telegraphy, was becoming of increasing importance, so that a number of young officers were also detailed to make special studies of these subjects. These officers spent some of their time in the bureaus in Washington and the rest in visiting various industrial plants throughout the country. After a few years it was realized that this scheme of study was too unsystematic to produce the best results. After considerable investigation by the Navy Department, it was decided to establish an engineering postgraduate school at the United States Naval Academy. This school opened its doors in 1909 with 10 student officers. The length of the course was set at two years. At first, the course consisted of lectures on advanced engineering subjects by prominent engineers, and the reading of selected engineering books and papers by the students, but it was soon found that the student officers were handicapped in their reading and in their understanding of much of the subject matter of the lectures by the inadequacy of their education in mathematics, mechanics, and thermodynamics. In order to remedy these deficiencies, a full-time staff of civilian professors and instructors was appointed at the school to give the student officers the needed instruction in mathematics and other theoretical subjects.

The Postgraduate School as now organized and administered comes directly under the Bureau of Navigation of the Navy Department. While located at the Naval Academy in Annapolis, Md., it is not under the control of the academic board of the Naval Academy. The head of the school is a senior naval officer assigned to this duty for a term of three or four years. The courses of study are conducted by a staff of 16 permanently employed civilian professors, and by about an equal number of specially qualified naval officers who serve tours of duty of about three years and are then relieved by other officers. The policy of the school and the courses of study pursued are determined by an executive council consisting of the superintendent of the Naval Academy, the head of the Postgraduate School, and a representative from each of the technical bureaus of the Navy Department. The Postgraduate School really embraces two distinct schools: the School of the Line, the primary purpose of which is the development of command as well as operative and administrative proficiency in young officers; and the Technical School comprising a number of curricula, the primary objective of which is the development of specialists in the design, inspection and installation of naval material of all kinds, including training in conducting research work. Some courses that are designed primarily for the Technical School are included in the School of the Line curriculum, and similarly, some courses that are of primary importance for the School of the Line are included in certain of the curricula of the Technical School. The studies pursued in the School of the Line cover special topics in such subjects as engineering, damage control, communications, tactics, ordnance and gunnery, international relations, economics, and related subjects.

The following courses of study are pursued at the Postgraduate School itself or under the supervision of the school at other educational institutions: general line duties; naval construction; civil engineering; metallurgy; engineering design covering propelling machinery, ordnance, torpedoes and mines; ordnance specialties covering fuses and explosives; radio and communications engineering; fire control; aeronautical engineering, aerological engineering; textile engineering; petroleum engineering; law; finance and supply; business administration.

The length of the courses varies from one to three years, depending on the specialty. The courses in general line studies, communication engineering, finance and supply, business administration, and textile engineering are completed in one year. The curricula for some of the specialties are given entirely at the Postgraduate School, Annapolis; for example, those covering general line studies, and communications. For other specialties such as ordnance and engineering design the first year, and in some cases the second year, is spent at the Postgraduate School, but the remainder of the course is given at an educational institution away from Annapolis. In the case of still other specialties, such as naval construction, civil engineering, and textile engineering, the entire course of postgraduate study is pursued at educational institutions other than the Postgraduate School. Briefly and without entering into details as to the studies being pursued at each institution, naval officers receive postgraduate instruction at the following educa-

tional institutions: Post Graduate School, Annapolis; Massachusetts Institution of Technology; Harvard University; University of Southern California; Carnegie Institute of Technology; University of Michigan; Rensselaer Polytechnic Institute; George Washington University; Babson Institute; Lowell Textile Institute; California Institute of Technology; and the Navy Finance and Supply School, Philadelphia.

During the summer vacations, the student officers are given practical instruction at navy yards, or they visit industrial plants to study the production and inspection of the naval materials that fall within the scope of their postgraduate studies. Those studying naval construction are put to work in navy yards during the summer as helpers to mechanics in the more important shipbuilding trades. The number of officers under postgraduate instruction varies somewhat from year to year, but has been around 250 in recent years, exclusive of those attending the School of the Line. Selections for postgraduate instruction are made by boards of officers, meeting at the Navy Department in Washington, from among those who apply for such study. Many more applications are always received than are needed to fill the quotas set up for the various specialties. Prior to the meeting of the boards in Washington, the Postgraduate School compiles for the consideration of the boards lists of candidates arranged as to their choice of specialty, their record since graduation from the Naval Academy, their marks in mathematics at the academy, and their class standing on graduation. These data give the boards some idea as to the capacity of the respective candidates for assimilating postgraduate education. The policy of the Navy Department is to make postgraduate education available only to those who are believed to be qualified to make the most of it.

In addition to providing postgraduate instruction for selected officers in various branches of engineering, the navy also conducts a number of schools to train officers and enlisted men in the operation of naval apparatus of various kinds. The most important of these schools are the Aviation Flight Training School at Pensacola, the Diving School at Washington, the Fire Control School, the Gyro Compass School, the Optical School, the Radio Material School, the Submarine Training School at New London, and the Torpedo School at Newport. Enlisted men, as well as officers, are given instruction at these schools. The courses last from a few months to a year. The instruction at these schools is mostly of a practical nature. In addition, there are a number of artificers schools where enlisted men are taught the rudiments of such trades as those of machinist, carpenter, plumber, electrician, etc.

The courses and facilities provided for educating officers in the material side of the navy have been briefly described. An equally important postgraduate school, namely, the Naval War College at Newport, R. I., should also be discussed. Shortly after the Civil War a group of officers led by Commodore S. B. Luce began to agitate for an advanced school of instruction where the art of naval warfare could be taught in its broader aspects. The need for such a school was clear to these officers, but Congress was hard to interest as money had to be provided to make the school possible. A Naval War

College was finally established at Newport, R.I., in 1885, with Rear Admiral Luce as its first president. The college passed through many vicissitudes. It was only through the untiring efforts, over a period of 25 years, of three officers (Rear Admiral S. B. Luce, who gave it life and defined its mission; Captain A. T. Mahan, whose works on sea power brought it fame; and Captain McCarthy Little, who developed its curriculum and its instructional procedure) that the importance of the War College as a step in the education of naval officers gradually received recognition from Congress and from the naval service itself.

During its early years, the student officers devoted most of their time to the analysis of historically important naval battles and campaigns, to the solution of assigned tactical and strategic problems, and to the discussion of interesting questions of international law. In about 1910 a change in the method of instruction was inaugurated. The scope of the problem work was increased, and the method of instruction was based upon a practical and competitive system making use of the game board and of chart maneuvers. Under this system of instruction, the student is first required to apply the accepted principles of reasoning to assumed strategic and tactical situations, and then to draw up plans and formulate orders designed to translate the decision into effective action. This is generally known as the Estimate of the Situation method of attacking problems. As the college year progresses, the situations and games increase in scope until assumed situations of major importance are reached. During the strategical and tactical games, particularly the latter, the period between moves is frequently greater than the time that would elapse between happenings in actual warfare. This is owing to the artificial nature of the set-up and to the mechanics involved. This lengthening of the period between moves actually works to the advantage of the student because it provides added time for reflection and for reasoning from cause to effect under circumstances where mistakes are not costly. After the student has had practice through the formal estimate method of developing his reasoning power, he is given a series of quick decision problems, the solution of which requires instant decision and translation into effective action. The study of international law (q.v.) has always formed part of the course of instruction, and has been expanded in recent years to include a background of national policy. The logistics in personnel, material, supply, and transport involved in strategical and tactical movements are also studied, both in their specific and general aspects, in the effort to determine the relationship which must exist in time of war between national resources and naval operations.

The Naval War College now provides four courses of instruction to fit the needs and availability of various classes of officers as follows:

(1) Two correspondence courses comprising strategy and tactics, and international law. These are absentee courses, which provide those officers who have not been able to take resident courses, an opportunity to prepare for such resident courses through studies (of restricted scope) in naval history, strategy, tactics, and international law. The courses are voluntary. The college mails to those officers who enroll in

either course a series of installments covering problems and information designed to accomplish the purpose of the course. Each solution submitted is commented upon by the college.

(2) A junior course comprising the study of minor operations of war through the medium of the Estimate of the Situation, and chart and game board maneuvers. With assumed minor situations as a basis, the student officer is exercised in logical reasoning from premise to decision and given practice in the preparation and execution of orders and plans. Greater stress is placed on tactics than on strategy in this course. The study of international law is included and follows the case system of arriving at individual solutions of hypothetical situations. The length of the junior course is 11 months. The class is composed of lieutenant commanders and lieutenants who have completed at least six years of commissioned service.

(3) A senior course paralleling the junior course except that the field of strategy and tactics is greatly expanded. The student officers are given exercise in handling and maintaining large fleets over extended theaters of war and in fleet engagements. National policy, elementary statecraft, and international relations, as foundations of naval strategy, replace elementary strategy and tactics as the subjects of individual thesis writing. The length of this course is also 11 months. The class is composed of officers of the Line of the Navy above the grade of lieutenant commander, and of such army, marine and naval staff officers as may be ordered. Lectures, demonstrative exercises, historical presentations, prescribed reading, study of official publications, critiques and conferences provide background and guidance for both classes.

(4) An advanced course which aims to provide and to conduct a course of study of the elements of the warring capacities of nations, of national objectives in peace and war, of military objectives in war, and of the means by which national and military objectives are attained. The senior member of the advanced class carries out a program of research and estimates directly under the president of the War College. The length of this course is also 11 months. The class is composed of flag officers, captains and commanders of the Line of the Navy and such army, marine and naval staff officers as may be detailed from those who have completed the senior course.

England.—Officers for the Line of the British Navy are obtained from four sources: the Royal Naval College, Dartmouth; the public schools by what is known as the special entry method; by transfer from the Royal Naval Reserve which is equivalent to transfer from the merchant marine; and by promotions from the enlisted force of the navy. During the year 1937, for example, the numbers obtained from these sources were 146, 118, 125, and 13, respectively. Boys are entered as cadets at Dartmouth at the age of 13, and after spending four years at that school, are sent to sea as midshipmen in training cruisers where they are given additional instruction in professional subjects. Special entry cadets must be graduates of an accredited public school and are taken into the service between the ages of 17 and 18. On joining the navy, they are appointed to a training cruiser for three cruises, each of about three months' duration. As the young officers appointed from the Naval

Reserve and from the enlisted force have had a considerable amount of practical experience, they are not sent to training cruisers. There is much difference of opinion in the British Navy as to the respective merits of the Dartmouth and the special-entry method of recruiting young officers. It is felt by many that at the age of 13 boys are too young to know whether they want to make a career of the navy. The protagonists of the special-entry method also claim that the Dartmouth cadet cannot be so well grounded in primary and secondary education, especially in mathematics and in the sciences, as the graduates of a public school. A good deal of time is devoted by all midshipmen during their first few years at sea to study and to practical instruction in gunnery, torpedoes, engineering, and signals. A special effort is also made to give them training in destroyers and a short air course. Instruction while attached to cruising ships is imparted to junior officers by instructor officers. The instructor and schoolmaster branches of the Royal Navy are unique to that service, and neither has a counterpart in other navies. Both are composed of officers entered specially and primarily to teach school subjects, the former to teach officers, the latter to teach enlisted men. The senior instructor officer of each ship is responsible to the captain for all of the scholastic work of the ship, including that of the schoolmaster.

After the young officers as midshipmen have successfully passed through the various courses of instruction afloat, lasting about two and one-half years, and have been promoted to acting sublieutenants, they are given courses ashore as follows in the order stated:

(1) A course lasting about a year at the Royal Naval College, Greenwich. This course covers such subjects as mathematics, applied mechanics, physics, languages, and the general principles of naval strategy and tactics.

(2) A gunnery course of about 10 weeks to fit officers for general gunnery duty on board ship. Ordnance design is not included in this course.

(3) A torpedo course of about six weeks to familiarize them with the construction, operation, and maintenance of torpedoes, mines, and protective devices against such weapons.

(4) A navigational and pilotage course of six weeks.

(5) A signal course of about four weeks at Portsmouth. The course covers practical signaling, as well as the fundamentals of the entire service of communications.

Line officers of the British Navy receive very little education in engineering, as there is a separate branch of the navy which does the engineering work. Some cadets transfer from Dartmouth to the engineer branch, but most of the engineer officers enter the navy for that specific purpose, and receive special education and training as engineers at Keyham Engineering College. Their method of entry into the service is similar to that of special-entry cadets into the line. Some of the officers of the engineering branch are also obtained by direct appointment of graduates holding engineering degrees from certain accredited colleges in Great Britain and Northern Ireland. Electrical engineering at the Admiralty and in the shore establishments is handled by civilian electrical engineering specialists, although the operation of

electrical apparatus on board ship comes under the engineer officer. Hull design is handled in the British Navy by the Royal Corps of Naval Constructors which is a civilian corps. The members of this corps are recruited from dockyard apprentices and from among naval architects in civil life. They are given a special course of instruction at the Royal Naval College, Greenwich, which at one time was open to students of foreign countries but is now restricted to the Royal Corps of Naval Constructors and to British subjects who intend to go into the ship-building industry.

Mention has already been made of the schoolmaster branch of the British Navy. The desirability of affording opportunity to seamen to educate themselves and so better fit themselves for the higher ratings and eventually for warrant rank was first officially recognized in 1837. In that year the rating of seaman's schoolmaster was established to hold voluntary school on board naval vessels and to teach seamen the subjects taught in primary schools, as well as plane trigonometry and the rudiments of navigation. The British Navy has continued this practice ever since, although the United States Navy discontinued the assignment of schoolmasters to ships many years ago, when the standard of education of the country at large had risen to the point where an adequate primary education could be made a prerequisite to enlistment in the navy. During the World War of 1914-18 the number of schoolmasters assigned to the ships of the British Navy was increased to the point where some 240 schoolmasters were entered for temporary war service and sent to the Grand Fleet. At sea, naval schoolmasters teach boys in the forenoon and afternoon, and in the evening they hold a variety of classes, at which attendance is voluntary, for chief petty officers, petty officers, and nonrated men. In the larger ships they have the assistance of a pupil-teacher. In ships that carry midshipmen and therefore have an instructor officer, that officer also gives instruction to the enlisted men. Some schoolmasters make a specialty of teaching electricity and wireless telegraphy.

France.—Naval cadets are appointed to the Naval Academy at Brest by the Minister of Marine. The entrance age ranges from 16 to 19 years. They must pass a rigid physical examination as well as a competitive mental examination, covering subjects which are somewhat more advanced than those required for entrance into the United States Naval Academy. Prospective cadets who feel that they are not well enough prepared to pass the entrance examination are given a year's course on board a training ship of the navy, where they are drilled in the subjects required in these examinations. Recourse is had to this method of preparation, particularly in the case of boys who enlist in the navy with a view to entering the Naval Academy from that source. After spending about a year at sea, following graduation from the Naval Academy as ensigns, the young officers are sent to a school of application for a period of one more year, although individuals are sometimes held over a second year. This school is conducted in normal times on a cruiser. The course of study covers a variety of subjects, most of them of a professional nature.

The following schools are maintained for the further education of line officers, but attendance

at the schools is not compulsory. The Gunnery School at Coubert is open to junior lieutenants and lieutenants and gives a course of instruction lasting about 13 months. The early periods are devoted to theoretical instruction followed in the later periods by practical demonstrations at sea and inspections of ordnance establishments. Officers may also be sent to the Coast Artillery School where theoretical as well as practical instruction is given. The Torpedo School at Au Mourillan gives officers a five-months' course of instruction followed by four months of practical demonstration. Torpedo instruction is also given at Toulon and at the Torpedo Director School at Patrie. The Submarine School at Toulon checks the qualifications of young officers for submarine duty and gives them a three-months' practical course in submarines before they are definitely assigned to such duty. Officers for aviation duty are first given a 10 months' course in piloting and theoretical aviation at the Aeronautic School in Paris, followed later by a six-months' course in advanced aviation for qualified pilots at the Advanced Aviation School, Rochefort. Postgraduate instruction in electricity and radio is given in courses lasting 10 months and 6 months, respectively, at the Radio and Electrical School, Paris. Line lieutenants desiring to specialize in ordnance submit applications to the Minister of Marine for transfer to that branch of the service. Those selected are sent to the School of Application of Naval Ordnance, Paris, where they pursue a two-years' course of special study covering all fields of naval ordnance and explosives. This course is very thorough. Two War College courses are given at the War College, Paris, for junior and senior officers, respectively. The courses last a year and are similar to those given at the Naval War College, Newport, described above.

The education and training of engineer officers begins as cadets at the Engineering School, Brest. Such cadets are selected and appointed in the same manner as are line cadets. Their courses of study are similar to those of line cadets, but they begin specializing in engineering immediately. There are no scheduled courses for the further instruction of officers of the engineer corps after they leave the engineering school, but they are sent back to Brest at intervals for postgraduate instruction.

The corps of naval constructors is recruited from graduates of the Ecole Polytechnique. This school is the preparatory school for the scientific branches of the public service of France and is under the control of the Minister of War. Its organization is military, with a general officer of the army at its head. The pupils of this school are carefully selected at the start, and the examination for admission assures a high standard of preliminary attainment. As the profession of naval construction is a favorite branch among the higher graduates of the Ecole Polytechnique, coming usually after mines, roads, and bridges, the candidates for selection are distinguished in a high degree by earnestness, intelligence, and thorough scientific attainments. They enter the School of Application of Naval Construction, Paris, at about the age of 21. The course is of two-years' duration and covers both hull and machinery design, although it specializes in the two branches in alternate years. After passing the final examinations, the students are admitted to the con-

struction corps as lieutenants. Foreign students are admitted to this school on the same terms as French citizens.

Practical schools are provided for the training of enlisted men in the various artificer branches of the French Navy, similar to those of other navies.

Germany.—Commissioned officers in the German Navy are classified as line officers, engineer officers, ordnance officers, medical officers, and administration officers. In other navies the corps of administration officers is known as the pay corps or the supply corps. Naval constructors are not commissioned officers, but are civilian officials. The selection, education, and training of German naval officers differs in many respects from that of officers in other navies. In the first place candidates must have had a broader preliminary education than is required in other navies, i.e., the equivalent of high school, plus two years of college as measured by American standards. Other navies do not require two years of college work. The candidates of the German Navy are, therefore, somewhat older than in other navies. Selection from among the many candidates who apply is made by the inspector of naval training at Kiel. Certificates from the schools which the candidate has attended are accepted in lieu of any further examination. In exceptional cases, if a candidate is deficient in the educational requirements but is considered highly qualified in other respects, he is given such additional preliminary instruction (sometimes up to a maximum of two years) as will enable him to pass special entrance examinations. After being provisionally accepted, the candidates for all corps are given five months of preliminary military training with a naval troop detachment at Stralsund. This applies even to those selected for the medical corps. The course of instruction for those designated for the line is as follows:

- 5 months: Preliminary military training.
- 4 months: Training in a sailing ship.
- 8½ months: Theoretical and practical instruction in a school ship, usually a cruiser.
- ½ month: Leave.
- 7 months: At the Naval School, Mürwik, followed by examinations.
- 5 months: Instruction in gunnery, torpedoes, submarines, communications, etc.
- 6 months: Active service in the fleet but still under instruction.

—
Total—36 months: Promotion to ensign.

The course for engineer and ordnance cadets differs from that of line cadets only in the subjects taught and in practical workshop training which is substituted for the four-months' cruise in a sailing ship. The same is true of the administration officers except that they spend the four months in learning administrative duties with a naval unit ashore. The aspirants for the medical corps are designated as navy medical cadets after they have completed the five months of preliminary military training and one month at the Navy Athletic School. They are then detached for university study. The course for medical officers is a very thorough one and requires seven years for its completion, including one year as an interne at a naval hospital. At

the end of that time the aspirant receives a commission as a medical officer with the rank of ensign. Cruises are made on naval ships during the university vacations.

Italy.—Commissioned officers of the line, the engineer corps, and the ordnance corps of the Italian Navy receive their basic education at the Royal Naval Academy at Livorno. Selection of candidates is by competitive examination from among young men who are not more than 19 years old, and who have graduated from a classical or scientific secondary school, and can pass the required physical and mental entrance examinations. The length of the course is three years, followed by a one-year instruction cruise. Engineer officers receive postgraduate instruction at the University of Genoa, and ordnance officers at the University of Turin. The engineer corps comprises both hull and machinery specialists. The education and training of these officers is similar to that of the officers designated for engineering duty in the United States Navy.

A considerable number of schools and courses of postgraduate instruction are provided for the education of officers of the Italian Navy. Newly commissioned junior lieutenants of the line are ordered back to the Naval Academy for a course of study lasting about one year, covering subjects similar to those taught at the Postgraduate School of the Line of the United States Navy. The School of Command is based at Taranto and consists of a squadron of torpedo boats and submarines each. All lieutenants of the line are required to attend this school before being eligible for promotion. The course lasts four months. The Naval War College at Livorno provides a course lasting one year for commanders, which is similar to the senior War College course provided for the United States Navy. The higher studies of maritime warfare are pursued by officers of the rank of captain at the Ministry of Marine, Rome. The course lasts five months, and the officers taking the course have, during that time, no other duties. The game board is used as part of the course of study.

Postgraduate courses of study in the following specialties are also provided each year for a few officers: electrical engineering in its various subdivisions, fire control, communications, hydrography, torpedoes and mines, chemistry of explosives, ordnance design, aeronautics, machinery design, diving, advanced medical specialization, military and penal law, merchandising, and submarines. These courses are given at various colleges and schools. See also **NAVAL ACADEMY, UNITED STATES; UNITED STATES—Navy of the United States** (Section 56).

J. A. FURER,

Rear Admiral, United States Navy.

NAVAL GUNS. See GUNS, NAVAL.

NAVAL INSTITUTE, United States, an organization founded in 1873 at Annapolis, Md., by officers stationed at the United States Naval Academy. It publishes monthly proceedings covering a wide range of articles, and also professional data of interest to naval officers. The proceedings are regarded as one of the most valuable and important publications on naval matters in the world because of the high standard that has been set for the articles contained therein. The membership of the institute includes a large portion of the officers of the

United States Navy. The proceedings also have many foreign subscribers. Each year the institute offers a life membership, a gold medal, and a prize of \$200 for the best essay or paper of interest to the naval service, as well as additional prizes for essays that receive honorable mention. In addition to the proceedings, the Naval Institute publishes many of the text books used at the Naval Academy, and other professional books on naval matters.

NAVAL INTELLIGENCE. The Office of Naval Intelligence is charged with the collection and dissemination of such technical information at home and abroad as will be useful to the various bureaus of the Navy Department in the formulation of plans for war and in the development of personnel and material. In peacetime the functions of this agency are to keep in touch with naval problems, naval expansion, and with matters of naval interest in all countries of the world, so that the President, the naval administration, and the naval committees in Congress may have access to the latest information with reference to naval affairs abroad. Its reports from naval attachés in maritime countries and from other sources furnish the General Board, the chief of naval operations, and the bureaus with data which give them the benefit of what has been learned or put into practice in other countries. During war, or during the emergency preceding a war, its duties increase many fold, as it is charged with the responsibility of investigating the adequacy of protection against sabotage of naval and commercial plants making naval material, and of keeping an eye on alien enemies and others who may be engaged in subversive activities. In this work it keeps in close touch with other government departments.

A detailed account of the work of this office cannot be given, as it is of a highly confidential character, but generally speaking, the scope of its activities include observation, investigation, and report on all subjects affecting the navy, and the prosecution of war from a naval point of view. It includes naval operations at sea and on land, the status, changes, and progress of the material and personnel of foreign navies, and a close counterespionage watch at home. During the World War of 1914-18 this latter included the investigation of unauthorized radio stations of alien enemies and suspects, of matters connected with the cable and mail censorship which affected the navy, the protection of water fronts and vessels, and of plants having contracts with the Navy Department, with a view to safeguarding those plants against sabotage. The guarding of ships while in port and the guarding against danger from enemy agents among the passengers and crews were largely planned and directed by the Office of Naval Intelligence.

NAVAL MANEUVERS. See ARMY AND NAVY MANEUVERS.

NAVAL MEDICAL CORPS, United States (officially the United States Navy Medical Corps). The Bureau of Medicine and Surgery of the Navy Department directs the activities of the medical corps, the dental corps, the nurses' corps, and the hospital corps of the United States Navy. The medical corps is the largest and most important of these four corps.

It consists of a body of medical officers having naval rank from lieutenant (junior grade) to rear admiral. The chief of the Bureau of Medicine and Surgery has the title of surgeon general with the rank of rear admiral. The maximum strength of the medical corps is fixed by law at .65 of 1 per cent of the combined strength in officers and enlisted men of the navy and of the marine corps. For various reasons, usually limited appropriations, the medical corps has never been up to its authorized strength since the World War of 1914-18. The actual strength of the corps is controlled from year to year by the amount of money Congress appropriates for the pay of the corps. The corps consisted of 869 officers on 1 July 1940, distributed among the various ranks as follows:

GRADE	WITH RANK OF
Medical Director 5	Rear Admiral
95	Captains
Medical Inspector 209	Commander
Surgeon 179	Lieutenant Commander
Passed Assistant Surgeon 168	Lieutenant
Assistant Surgeon 188	Lieutenant (junior grade)
Acting Assistant Surgeon 25	Lieutenant (junior grade)

Appointments to the medical corps are made either in the grade of assistant surgeon with the rank of lieutenant (jg), or in the grade of acting assistant surgeon, also with the rank of lieutenant (jg). In both cases such appointments are made after a competitive examination, which is held in June of each year. In order to enter the examination for appointment as an assistant surgeon, the candidate must be a graduate of a Class A medical school and must have had an internship in a civil hospital; for appointment as an acting assistant surgeon, the candidate must have completed the fourth or senior year in a Class A medical school, but is not required to have had an internship. Those who enter as acting assistant surgeons are assigned for one year to an internship at a naval hospital. Should the intern at the end of the year desire to return to the practice of medicine in civil life, his appointment as an acting assistant surgeon is terminated, and he is honorably discharged from the naval service. If he desires to continue in the naval service, he must pass a further competitive examination.

The professional examination for assistant surgeons embraces the subject of general medicine, general surgery, obstetrics and gynecology, preventive medicine, and medical jurisprudence. The professional examination for acting assistant surgeons covers only the subjects of general medicine and general surgery, in addition to an oral and practical examination. Each candidate must also pass a thorough physical examination. Successful candidates for appointment as interns in the grade of acting assistant surgeons are assigned to one of the following naval hospitals for their internship: Boston, Mass.; New York, N. Y.; Philadelphia, Pa.; Washington, D. C.; Norfolk, Va.; San Diego, Calif.; and Mare Island, Calif. The internship is for a period of one year, during which the interns are given five months of medical duty, five months of surgical duty, and two months of laboratory work. On entering into the service as assistant surgeons or acting assistant sur-

geons with the rank of lieutenant (jg), officers receive \$2,690 per year if they have no dependents, and \$3,158 per year if they have dependents.

Promotion in the medical corps follows promotion in the Line of the Navy on what is called the "running mate" principle. This same principle applies to the promotion of officers in other staff corps. Briefly, it consists of assigning a line officer running mate to each staff officer. This running mate, in the case of the medical corps, is the line officer who was commissioned a lieutenant (jg) on the same date that the newly appointed medical officer was commissioned. If the particular line officer who acted as the original running mate drops out of the service, the next officer above him becomes the new running mate. A staff officer, such as an officer in the medical corps, becomes eligible for promotion to the next higher rank when his running mate in the line becomes eligible for promotion. No limit is placed on the number of medical officers that may be promoted each year from lieutenant (jg) to lieutenant, or from lieutenant to lieutenant commander, provided they are eligible by reason of their running mates having become eligible. Beyond the rank of lieutenant commander, only the same percentage of medical officers may be selected in any one year as the percentage of line officers who were selected from among those who were eligible. The selections for promotion in the medical corps are made by a board of senior medical officers.

The principal administrative positions in the Bureau of Medicine and Surgery of the Navy Department are manned by officers of the medical corps, although the other corps mentioned above are also represented. In general, the Bureau of Medicine and Surgery is charged with the responsibility for the maintenance of the health of the navy, for the care of the sick and injured, and for the professional education and training of officers, nurses, and men of the Medical Department. That bureau is charged also with the management and control of all naval hospitals, medical supply depots, medical laboratories, and all technical schools established for the education and training of the members of the medical corps, dental corps, nurses corps, and hospital corps of the navy. It acts in an advisory capacity to the other branches of the navy in matters pertaining to clothing and food, water supply used for drinking, cooking and bathing purposes, and to the draining and disposal of waste so far as these affect the health of the navy. It provides for the physical examination of officers, nurses, and enlisted men of the navy, with a view to the selection or retention of those whose physical condition is such as to maintain or improve the military efficiency of the service as a whole. While the Bureau of Navigation is responsible for all personnel of the navy as a whole, the Bureau of Medicine and Surgery advises that bureau as to the complement of Medical Department personnel for hospitals, hospital ships (q.v.), and other ships of the navy. The number of medical officers and other medical personnel assigned to each ship depends largely on the size and the type of the ship. Battleships and large aircraft carriers have two medical officers and one dental officer, and cruisers have one medical officer and one dental officer. Smaller ships have a medical officer, but no dental officer.

Destroyers have a medical officer for each division only, a hospital corps man being assigned to each destroyer. The only ships to which female nurses are assigned are hospital ships, their principal duties being ashore at naval hospitals.

NAVAL MINES. See SUBMARINE MINES, MINELAYING AND MINESWEEPING.

NAVAL OBSERVATORY, The United States, a government institution, located in Washington, D.C., and serving as the national observatory of the United States. Its main activities are in those fields of mathematical and observational astronomy which have immediate practical applications in military, scientific, and civil affairs. Since these fields are not covered by the work of private observatories, the Naval Observatory alone publishes almanacs, makes observations for the basic determination of time and frequency, and makes observations of the principal celestial bodies which provide a fundamental astronomical coordinate system. The observatory acts as an adviser to various branches of the government and undertakes special projects on their behalf.

Early Period: 1830 to 1865.—Attempts were made as early as 1809 to establish a national observatory on general scientific grounds. Although these efforts were not successful, an observatory was created by the Navy Department to meet the needs of navigation. In this early period, naval officers engaged in both the scientific and administrative work of the observatory. The officers instrumental in the founding of the Naval Observatory and the Nautical Almanac Office were Lieuts. Louis M. Goldsborough, Charles Wilkes, James M. Gilliss, Matthew Fontaine Maury, and Charles Henry Davis.

At the suggestion of Lieutenant Goldsborough, who was made officer-in-charge, a Depot of Charts and Instruments was established in 1830 for the purpose of purchasing, repairing, and issuing navigational items such as chronometers, compasses, almanacs, and charts. A small transit instrument was used to determine time, which was necessary for rating chronometers.

Lieutenant Wilkes took charge in 1833, and at his own expense added several instruments and a small observing house. The depot began printing charts in 1835, as some of those purchased were printed in foreign languages.

Lieutenant Gilliss succeeded Wilkes in 1837, and the astronomical work was enlarged through the purchase of several new instruments. The work of the depot was being carried out in rented quarters, which were unsuitable, and Gilliss urged the construction of a permanent building which would house an astronomical observatory. This was authorized by Congress in 1842, the year which may be regarded as that of the founding of the Naval Observatory. A site located about three quarters of a mile west of the White House was selected. Gilliss was charged with the preparation of the plans, and was relieved by Lieutenant Maury.

The new building was ready in 1844 and Maury took charge as the first superintendent. Observations were begun in January 1845, and the results for that year were printed in the first volume of the *Washington Observations*. The instruments used included a 9.6-inch refractor, a 5.3-inch transit, a 4.9-inch prime vertical transit, and two mural circles. Both astronomical and hydrographic re-

searches were carried on, the two fields not being formally separated until 1866 by the creation of a separate Hydrographic Office. While Maury's fame rests largely on his hydrographic researches, astronomy was not neglected. His aim, from the outset, was to provide observations of such a caliber that an American nautical almanac could be computed. Such a volume predicts the positions of celestial objects, and is essential for the conduct of navigation, astronomy, and nautical surveying.

At the suggestion of Lieutenant Davis, the American Nautical Almanac Office was established independently in 1849 in Cambridge, Mass., and he was directed to take charge as superintendent. Several years were spent in forming new planetary tables, to replace existing ones which were not accurate enough, and in 1852 the first volume, the *Almanac* for 1855, was published. Davis was a mathematician as well as an active naval officer, and he translated *Theoria Motus Corporum Coelestium* by Karl Friedrich Gauss. He served as superintendent of the Almanac Office twice and also as superintendent of the observatory twice. The Almanac Office was first located at Cambridge, Mass., because of the mathematical help that Harvard College could provide. In 1866 the Almanac Office was moved to Washington, but did not formally become a part of the observatory until 1894.

Maury, who was promoted to the rank of commander in 1855, served as superintendent of the observatory from 1844 to 1861. He was replaced by Gilliss, then captain, who served until 1865. The latter was succeeded by Davis, then rear admiral.

Middle Period: 1865-1893.—The degree of specialization required for further progress in astronomy had become such as to preclude active naval officers from engaging in the scientific researches. The astronomer destined to have the widest influence on the character of the observatory and astronomy as a whole during this period was Simon Newcomb. He undertook what was described by Henri Poincaré as the colossal task of forming new tables which would give the positions of the planets with the highest possible accuracy. To carry out this scheme, it was necessary (1) to have fundamental observations of the Sun, Moon, planets, and principal stars; (2) to determine a new set of astronomical constants; and (3) to construct mathematical formulas, based upon the law of gravitation, for predicting the positions of the Sun, Moon, and planets for any time in the past or future, which are known as "theories of the motion."

Since mathematically exact expressions cannot be obtained, the degree of refinement to which the theory is carried is governed largely by the accuracy which the data (1) and (2) possess. Accordingly, Newcomb urged the purchase of two new instruments, an 8.5-inch transit circle, obtained in 1865, for making the fundamental observations, and a 26-inch refractor, mounted in 1873, for observing the satellites of planets. The latter observations were for the purpose of determining the masses of the planets.

The 26-inch was built by the firm of Alvan Clark & Sons, with optical disks furnished by Chance Bros. of England. At the time it was the largest refractor in the world as good disks of such size had not previously been cast. With this telescope Asaph Hall made the valuable discovery, in 1877, of the two satellites of Mars.

Newcomb became superintendent of the Nautical Almanac Office in 1877 and served until 1897 (the title was changed to director in 1894). During this 20-year period the astronomical constants were revised and the new tables were prepared. He himself prepared the theories of Mercury, Venus, the Earth, Mars, Uranus, and Neptune. The most difficult part of the task, the theories of Jupiter and Saturn, were entrusted to George William Hill, who, according to Newcomb, "will easily rank as the greatest master of mathematical astronomy during the last quarter of the nineteenth century." Among Hill's outstanding achievements are his researches on the motion of the Moon. These were later developed by Ernest W. Brown of Yale University Observatory to form the most accurate lunar theory available.

The theories may contain hundreds or thousands of terms, and for practical use tables must be constructed. The planetary tables compiled by Newcomb, and his values of the fundamental constants, are now used by all nations in constructing their almanacs. At an international conference held in Paris in 1896 it was agreed that these constants would be used beginning with the almanacs for 1901. This step had two important consequences: (1) it eliminated a chaotic condition in astronomy which had hindered research, and (2) it made possible the exchange of data among the national almanacs so as to eliminate much computing. The exchange of data was agreed upon by a conference in Paris in 1911, and in the next year Congress authorized the participation of the American Almanac Office in this scheme.

The public distribution of time by the observatory had begun in 1845, a time ball being dropped at noon. In 1865 the Western Union Telegraph Company ran its lines into the Time Service and thus started the distribution of Naval Observatory time to its subscribers. The observatory also furnished time to other agencies which ran lines to the Time Service.

Expeditions were organized to observe the solar eclipses of 1869, 1870, 1878, and 1889, and the transits of Venus in 1874 and 1882. The observations of the transits were reduced by William Harkness, who derived a value of the solar parallax.

With the growth of the city the location of the observatory became unsuitable and in 1881 a new site, about two miles to the northwest, was selected. The new buildings were ready for occupancy in 1893. The old buildings now house the Navy Medical School Museum of Hygiene.

Period Since 1893.—The present site of the Naval Observatory is in the form of a nearly complete circle of 2,000 feet diameter. No public street may cut through the grounds, and Massachusetts Avenue has a bend where it passes the observatory. The Administration Building houses the Almanac Office, the Time Service, the library, administrative offices, and the 12-inch refractor. Separate buildings house other telescopes and the service facilities.

The Naval Observatory is a field activity under the management control of the chief of naval operations. It is in charge of a naval officer not below the rank of captain, who is the superintendent. The astronomical programs are laid out by an Astronomical Council which includes the superintendent and the directors of the five astronomical divisions.

The Nautical Almanac Office publishes three principal volumes annually: *The American Ephemeris*

and *Nautical Almanac*, for general astronomical purposes; *The American Nautical Almanac*, for sea navigation; and jointly with the corresponding British office, *The Air Almanac*. Research is being carried out with the aim of improving the planetary tables; much of this is on a cooperative basis with the British Nautical Almanac Office, Yale University Observatory, and the Watson Scientific Computing Laboratory. By action of the International Astronomical Union the national almanacs beginning with 1960 will use new tables for the following: (1) the ephemeris of Mars, Jupiter, Saturn, Uranus, Neptune and Pluto; (2) the ephemeris of the Moon, recomputed with higher accuracy from Brown's theory; and (3) the nutation.

Two transit circles are used for obtaining fundamental positions of the Sun, Moon, planets, and stars. The positions of the latter serve as reference points in determining the positions of the vast quantity of stars that can be observed by photography. The 6-inch transit circle was constructed in 1897 by the Warner and Swasey Co., and has been modified from time to time. Of particular importance is the method of reading the circles and micrometers by photography and of reducing the data automatically. The 8.5-inch transit circle, used up to 1945, was also modified, a 9-inch lens by Clark being substituted in 1893. It was being replaced in 1953 by a 7-inch transit circle which was designed at the observatory and made in its instrument shop. A special project being carried out was the mapping of the marginal zone of the Moon. An automatic photoelectric measuring machine was constructed, which plots the Moon's profile. Numerous photographs taken at the Naval Observatory and at other observatories were being measured and the final results will aid in the solution of certain astronomical and geodetic problems.

A 40-inch Ritchey-Chrétien reflector, built by George W. Ritchey in 1934, is used for astrometric and astrophysical purposes. A photoelectric photometer is used with it to determine the brightness of stars accurately. The discovery of interstellar polarization provides one of the main lines of research.

The 26-inch refractor was remounted by Warner and Swasey in 1893. Both visual and photographic observations are made. The objective is still in excellent condition despite some 80 years of service.

A 15-inch photographic refractor built by Warner and Swasey has a Cooke triplet objective furnished by the Perkin-Elmer Corp. It is used for astrometric work and for the study of scintillation of starlight by electronic techniques.

A photoheliograph of 5-inch aperture and 39 feet focal length is used for photographing sunspots. Visual observations of prominences and flares are made in the light of hydrogen with a Baird birefringent filter.

The determination of time is made with an instrument called a photographic zenith tube (PZT), having an 8-inch objective. It photographs only stars which transit near the zenith. It was acquired in 1915 for the determination of the variation of latitude, but was modified in 1934 so as to determine time also. Its accuracy is so high that it is being adopted by several other countries. Initially, precision pendulum clocks kept in vaults were used for timekeeping. These have now been superseded by electronic clocks, which are quartz-crystal controlled. The first clock of this type

used for the automatic transmission of time signals was built at the observatory in 1931. The transmission of time signals by naval radio stations was started in 1904, and now there is world-wide coverage. In addition, station WWV of the National Bureau of Standards affords continuous broadcasts of time and frequency based on the observations made at the observatory. In order to increase the accuracy of time determination and of the variation of latitude, a Time Service Substation, containing a second PZT, was established in 1949 at Richmond, Fla., about 15 miles south of Miami.

The rotation period of the Earth, which is the ordinary basis of timekeeping, is subject to small fluctuations. While of no consequence for many purposes, it does limit the accuracy with which frequency can be determined, a matter of concern in some fields of radio. Uniform time of great accuracy may be obtained, however, by using the Moon as a clock. A special camera, attached to the 12-inch refractor, has been developed for this purpose. It determines the position of the Moon with greater accuracy than was previously possible.

The repair of chronometers and navigational instruments by the observatory was terminated in 1950. An astronomical instrument shop, however, has been retained.

The library is devoted chiefly to astronomical and mathematical publications, and contains over 50,000 volumes. While maintained primarily for the needs of the observatory staff, the use of the library is available to other scientific investigators.

In addition to the almanacs, the observatory issues several other publications. The *Astronomical Papers of the American Ephemeris* contain the results of theoretical research of the Almanac Office. The *Publications of the U.S. Naval Observatory* contain the star catalogues and other observational results. The *U.S. Naval Observatory Circulars* contain brief works and sunspot measurements.
